ENCYCLOPÆDIA BRITANNICA.

H Y D

HYDROGRAPHICAL CHARTS or **MAPS**, more usually called sea-charts, are projections of some part of the sea, or coast, for the use of navigation. In these are laid down all the rhumbs or points of the compass, the meridians, parallels, &c. with the coasts, capes, islands, rocks, shoals, shallows, &c. in their proper places and proportions.

HYDROGRAPHY, the art of measuring and describing the sea, rivers, canals, lakes, &c.—With regard to the sea, it gives an account of its tides, counter-tides, soundings, bays, gulfs, creeks, &c.; as also of the rocks, shelves, sands, shallows, promontories, harbours; the distance and bearing of one port from another; with every thing that is remarkable, whether out at sea or on the coast.

HYDROLEA, a genus of plants belonging to the pentandria class, and in the natural method ranking with those of which the order is doubtful. See **BOTANY Index**.

HYDROMANCY, a method of divination by water, practised by the ancients. See **DIVINATION**, N° 7.

HYDROMEL, honey diluted in nearly an equal weight of water. In this liquor has not fermented, it is called *simple hydromel*; and when it has undergone the spirituous fermentation, it is called the *vinous hydromel* or *mead*.

Honey, like all saccharine substances, vegetable or animal, is susceptible of fermentation in general, and particularly of the spirituous fermentation. To induce this fermentation, nothing is necessary but to dilute it sufficiently in water, and to leave this liquor exposed to a convenient degree of heat. To make good vinous hydromel or mead, the whitest, purest, and best tasted honey must be chosen; and this must be put into a kettle with more than its weight of water: a part of this liquor must be evaporated by boiling, and the liquor scummed, till its consistence is such that a fresh egg shall be supported upon its surface without sinking more than half its thickness into the liquor; then the liquor is to be strained and poured through a funnel into a barrel: this barrel, which ought to be nearly full, must be exposed to a heat as equable as is possible, from 20 to 27 or 28 degrees of Mr Reaumur's thermometer, taking care that the bung-hole be slightly covered, but not closed. The phenomena of the spirituous fermentation will appear in this liquor, and will subsist during two or three

VOL. XI. Part I.

H Y D

months, according to the degree of heat; after which they will diminish and cease. During this fermentation, the barrel must be filled up occasionally with more of the same kind of liquor of honey, some of which ought to be kept apart on purpose to replace the liquor which flows out of the barrel in froth. When the fermentation ceases, and the liquor has become very vinous, the barrel is then to be put in a cellar and well closed. A year afterwards the mead will be fit to be put into bottles.

The vinous hydromel or mead is an agreeable kind of wine: nevertheless it retains long a taste of honey, which is unpleasing to some persons; but this taste it is said to lose entirely by being kept a very long time.

The spirituous fermentation of honey, as also that of sugar, and of the most of vinous liquors, when it is very saccharine, is generally effected with more difficulty, requires more heat, and continues longer, than that of ordinary wines made from the juice of grapes; and these vinous liquors always preserve a saccharine taste, which shows that a part only of them is become spirituous.

HYDROMETER, an instrument to measure the gravity, density, &c. of water and other fluids. For an account of different hydrometers, see **HYDRODYNAMICS**.

HYDROMPHALUS, in medicine and surgery, a tumor in the navel, arising from a collection of water.

HYDROPHANES, or **OCULUS MUNDI**, a kind of precious stone, which becomes transparent in water, much esteemed by the ancients.

HYDROPHOBIA, an aversion or dread of water: a terrible symptom of the *rabies canina*; and which has likewise been found to take in violent inflammations of the stomach and in hysteric fits. See **MEDICINE Index**.

HYDROPHYLACIA, a word used by Kircher and some others who have written in the same system, to express those great reservoirs of water which he places in the Alps and other mountains for the supply of rivers which run through the several lower countries. This he makes to be one of the great uses of mountains in the economy of the universe.

HYDROPHYLLAX, a genus of plants belonging to the tetrandria class. See **BOTANY Index**.

HYDROPHYLLUM, **WATER-LEAF**, a genus of plants

plants belonging to the pentandria class, and in the natural method ranking with those of which the order is doubtful. See *BOTANY Index*.

HYDROPS, in *Medicine*, the same with DROPSY.

HYDROSCOPE, an instrument anciently used for measuring time.

The hydroscope was a kind of water-clock, consisting of a cylindrical tube, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out at the vertex of the cone, pointed out the hour.

HYDROSTATICS, is that branch of physics which treats of the weight, pressure, and equilibrium of fluids. See *HYDRODYNAMICS*.

HYDROTHORAX, a collection of water in the breast. See *MEDICINE Index*.

HYDRUNTUM, in *Ancient Geography*, a noble and commodious port of Calabria, from which there was a shorter passage to Apollonia (Pliny). Famous for its antiquity, and for the fidelity and bravery of its inhabitants. Now Otranto, a city of Naples, at the entrance of the gulf of Venice. E. Long. 19. 15. N. Lat. 40. 12.

HYEMANTES, in the primitive church, offenders who had been guilty of such enormities, that they were not allowed to enter the porch of the churches with the other penitents, but were obliged to stand without, exposed to all the inclemency of the weather.

HYGEIA, in *Mythology*. See *HEALTH*.

HYGIEINE, *Ἑγίεινη* (formed of *ἕγινε*, "found, healthy"), that branch of medicine which considers health, and discovers proper means and remedies, with their use, in the preservation of that state.

The objects of this branch of medicine are, the non-naturals. See *DIET, EXERCISE, &c.*

HYGIEINE, more largely taken, is divided into three parts; prophylactice, which foresees and prevents diseases; syntentice, employed in preserving health; and analeptice, whose office is to cure diseases, and restore health.

HYGROMETER, an instrument for measuring the degrees of dryness or moisture of the atmosphere, in like manner as the barometer and thermometer measure its different degrees of gravity or warmth.

Though every substance which swells in moist, and shrinks in dry weather, is capable of becoming an hygrometer; yet this kind of instrument is far from being as yet arrived at such a degree of perfection as the barometers and thermometers. There are three general principles on which hygrometers have been constructed. 1. The lengthening and shortening of strings by dryness and moisture, or their twisting and untwisting by the same. 2. The swelling and shrinking of solid substances by moisture or dryness; and 3. By the increase or decrease of the weight of particular bodies whose nature is to absorb the humidity of the atmosphere.

Hygrome-
ters of
three kinds.

Smeaton's.

I. On the first of these principles Mr Smeaton constructed an hygrometer greatly superior to any that had appeared before; and of which the following account is given in the 62d volume of the *Philosophical Transactions*.

"Having some years ago attempted to make an ac-

curate and sensible hygrometer by means of a hempen cord of a considerable length, I quickly found, that though it was more than sufficiently susceptible of every change in the humidity of the atmosphere, yet the cord was upon the whole in a continual state of lengthening. Though this change was the greatest at first, yet it did not appear probable that any given time would bring it to a certainty; and furthermore, it seemed, that as the cord grew more determinate in mean length, the alteration by certain differences of moisture grew less. Now, as on considering wood, catgut, paper, &c. there did not appear to be a likelihood of finding any substance sufficiently sensible of differences of moisture that would be unalterable under the same degrees thereof; this led me to consider of a construction which would readily admit of an adjustment; so that, though the cord whereby the instrument is actuated may be variable in itself, both as to absolute length, and difference of length under given degrees of moisture, yet that, on supposition of a material departure from its original scale, it might be readily restored thereto; and, in consequence, that any number of hygrometers, similarly constructed, might, like thermometers, be capable of speaking the same language.

Hygrome-
ter.

"The two points of heat the more readily determinable in a thermometer, are the points of freezing and boiling water. In like manner, to construct hygrometers which shall be capable of agreement, it is necessary to establish two different degrees of a moisture which shall be as fixed in themselves, and to which we can have recourse as readily and as often as possible.

"One point is given by making the substance perfectly wet, which seems sufficiently determinable; the other is that of perfect dry, which I do not apprehend to be attainable with the same precision. A readiness to imbibe wet, so that the substance may be soon and fully saturated, and also a facility of parting with its moisture on being exposed to the fire to dry, at the same time, that neither immersion, nor a moderate exposition to the warmth of the fire, shall injure its texture, are properties requisite to the first mover of such an hygrometer, that in a manner exclude all substances that I am acquainted with, besides hempen and flaxen threads and cords, or substances compounded of them.

"Upon these ideas, in the year 1758, I constructed two hygrometers as nearly alike as possible, in order that I might have the means of examining their agreement or disagreement on similar or dissimilar treatment. The interval or scale between dry and wet I divided into 100 equal parts, which I call the degrees of this hygrometer. The point of 0 denotes perfect dry; and the numbers increase with the degrees of moisture to 100, which denotes perfect wet.

"On comparing them for some time, when hung up together in a passage or staircase, where they would be very little affected by fire, and where they would be exposed to as free an air as possible in the inside of the house, I found that they were generally within one degree, and very rarely differed two degrees; but as these comparisons necessarily took up some time, and were frequently interrupted by long absences from home, it was some years before I could form a tolerable judgment of them. One thing I soon observed, not altogether

Hygrometer. altogether to my liking, which was, that the flaxen cords made use of seemed to make so much resistance to the entry of small degrees of moisture (such as is commonly experienced within doors in the situation above-mentioned), that all the changes were comprised within the first 30° of the scale; but yet, on exposing them to the warm steam of a wash-house, the index quickly mounted to 100. I was therefore desirous of impregnating the cords with something of a saline nature, which should dispose them more forcibly to attract moisture; in order that the index might, with the ordinary changes of the moisture in the atmosphere, travel over a greater part of the scale of 100. How to do this in a regular and fixed quantity, was the subject of many experiments and several years interrupted inquiry. At last I tried the one hereafter described, which seemed to answer my intention in a great measure; and though upon the whole it does not appear probable that ever this instrument will be made capable of such an accurate agreement as the mercurial thermometers are, yet if we can reduce all the disagreements of an hygrometer within $\frac{1}{40}$ th part of the whole scale, it will probably be of use in some philosophical inquiries, in lieu of instruments which have not yet been reduced to any common scale at all.

Plates
CCLXXVI.
CCLXXVII.
“ Fig. 1. and 2. ABC is an orthographic delineation of the whole instrument seen in front in its true proportion. DE is that of the profile, or instrument seen edgewise. FG in both represents a flaxen cord about 35 inches long, suspended by a turning peg F, and attached to a loop of brass wire at A, which goes down into the box cover H, and defends the index, &c. from injury; and by a glass exposes the scale to view.

“ Fig. 3. shows the instrument to a larger scale, the upright part being shortened, and the box-cover removed; in which the same letters represent the same parts as in the preceding figures; GI are two loops or long links of brass wire, which lay hold of the index KL, moveable upon a small stud or centre K. The cord FG is kept moderately strained by a weight M of about half a pound avoirdupois.—It is obvious, that, as the cord lengthens and shortens, the extreme end of the index rises and falls, and successively passes over N 2 the scale disposed in the arch of a circle, and containing 100 equal divisions. This scale is attached to the brass sliding ruler QP, which moves upon the directing piece RR, fixed by screws to the board, which makes the frame or base of the whole; and the scale and ruler NQP is retained in any place nearer to or further from the centre K, as may be required by the screw S.

“ Fig. 4. represents in profile the sliding piece and stud I (fig. 3.), which traverses upon that part of the index next the centre K; and which can, by the two screws of the stud, be retained upon any part of the index that is made parallel; and which is done for three or four inches from the centre, for that purpose. The stud is filed to the edges, like the fulcrum of a scale-beam; one being formed on the under side, the other on the upper, and as near as may be to one another. An hook formed at the lower end of the wire-loops CI, retains the index, by the lowermost edge of the stud; while the weight M hangs by a small hook upon the upper edge: by these means the index

Hygrometer. is kept steady and the cords strained by the weight, with very little friction or burthen upon the central stud K.

“ Fig. 5. is a parallelogram of plate-brass, to keep out dust, which is attached to the upper edge of the box-cover H; and serves to shut the part of the box-cover necessarily cut away, to give leave for the wire GI to traverse with the sliding stud nearer to or further from the centre of the index K; and where, in fig. 5. *a* is a hole of about an inch diameter, for the wire GI to pass through in the rising and falling of the index freely without touching; *b* is a slit of a lesser size, sufficient to pass the wire, and admit the cover to come off without deranging the cord or index; *cc* are two small screws applied to two slits, by which the plate slides lengthwise, in order to adapt the hole *c* to the wire GI, at any place of the stud I upon the index KL.

“ 1. In this construction, the index KL being 12 inches long, 4 inches from the extreme end are filed so narrow in the direction in which it is seen by the eye, that any part of these four inches lying over the divisions of the scale, becomes an index thereto. The scale itself slides four inches, so as to be brought under any part of the four inches of the index attenuated as above-mentioned.

“ 2. The position of the directing piece RR is so determined as to be parallel to a right line drawn through *o* upon the scale, and the centre K of the index; consequently, as the attenuated part of the index forms a part of a radius or right line from the same centre, it follows, that whenever the index points to *o* upon the scale, though the scale is moved nearer to or further from the centre of the index, yet it produces no change in the place to which the index points.

“ When the divided arch of the scale is at 10 inches from the centre (that is, at its mean distance); then the centre of the arch and the centre of the index are coincident. At other distances, the extremes of which are eight or twelve inches, the centre of the divisions, and the centre of the index pointing thereto, not being coincident, the index cannot move over the spaces *geometrically* proportionable to one another in all situations of the scale; yet the whole scale not exceeding 30° of a circle, it will be found on computation, that the error can never be so great as $\frac{1}{100}$ th part of the scale, or 1° of the hygrometer; which in this instrument being considered as indivisible, the mechanical error will not be sensible.

“ The cord here made use of is flax, and between $\frac{1}{16}$ th and $\frac{1}{8}$ th of an inch in diameter; which can be readily ascertained by measuring a number of turns made round a pencil or small stick. It is a sort of cord used in London for making nets, and is of that particular kind called by net-makers *flaxen three-threads laid*. A competent quantity of this cord was boiled in one pound avoirdupois of water, in which was put two pennyweights troy of common salt; the whole was reduced by boiling to six ounces avoirdupois, which was done in about half an hour. As this ascertains a given strength of the brine, on taking out the cord, it may be supposed that every fibre of the cord is equally impregnated with salt. The cord being dried, it will be proper to stretch it; which may be done so as to prevent it from untwisting, by tying

Hygrometer. three or four yards to two nails against a wall, in an horizontal position, and hanging a weight of a pound or two to the middle, so as to make it form an obtuse angle. This done for a week or more in a room, will lay the fibres of the cord close together, and prevent its stretching so fast after being applied to the instrument as it would otherwise be apt to do.

“ The hygrometer is to be adjusted in the following manner. The box-cover being taken off to prevent its being spoiled by the fire, and choosing a day naturally dry, set the instrument nearly upright, about a yard from a moderate fire; so that the cord may become dry, and the instrument warm, but not so near as would spoil the finest linen by too much heat, and yet fully evaporate the moisture; there let the instrument stay till the index is got as low as it will go; now and then stroaking the cord betwixt the thumb and finger downwards, in order to lay the fibres thereof close together; and thereby causing it to lengthen as much as possible. When the index is thus become stationary, which will generally happen in about an hour, more or less as the air is naturally more or less dry, by means of the peg at top, raise or depress the index, till it lies over the point *o*. This done, remove the instrument from the fire; and having ready some warm water in a tea-cup, take a middling camel’s hair pencil, and dipping it in the water, gently anoint the cord till it will drink up no more, and till the index becomes stationary and water will have no more effect upon it, which will also generally happen in about an hour. If in this state the index lies over the degree marked 100, all is right: if not, slack the screw *S*, and slide the scale nearer to or further from the centre, till the point 100 comes under the index, and then the instrument is adjusted for use: but if the compass of the slide is not sufficient to effect this, as may probably happen on the first adjustment, slack the proper screws, and move the sliding stud *I* nearer to or further from the centre of the index, according as the angle formed by the index between the two points of dry or wet happens to be too small or too large for the scale.”

Coventry’s. On this principle, a simple hygrometer has been made by Mr Coventry of Southwark, London. It is not upon the most accurate construction, yet will act very sensibly in the common changes of the air. Fig. 6. represents the hygrometer as applied to a wall or board. *A* is a string of whip-cord, catgut, &c. of any length at pleasure: it is suspended on a bracket *B*, and kept extended by a weight at the bottom *C*. *DD* is a slip of wood, which with the bracket is fixed perpendicularly to a wall or side of a room. It has a straight line *E* drawn down in the middle of the board, serving to point out the divisions upon the edges of the two thin circular cards *F* and *G*. At the centre of the bottom of each of these cards is glued a piece of cork, through which the string *A* is drawn: These cork pieces serve to preserve the horizontal position of the cards. The upper card *F* is divided into 10 equal parts or divisions, and the under card *G* into 100 equal parts; the string *A* being measured into 10 equal parts, from the point of suspension *H* to the surface of the lower card *I*. The card *F* is hung at the first part, from *H*, and the card *G* at the 10th part from the same point: consequently, from the twisting and

untwisting of the string *A* by the different changes of the air, the lower card *G*, from the mechanical principles of motion, will describe 10 revolutions for one of the upper card *F*; or when the lower card *G* has made one revolution, the upper card *F* will have described but the 10th part, or one of its divisions. From whence it appears, that by the assistance of the upper card *F*, an index is thereby obtained of the number of revolutions the lower card *G* performs, which are reckoned by the line *E* on the slip of wood.

Example. It must first be observed what division of the card *F* the line *E* is against, suppose 3; and also what division of the lower card *G* is cut by the same line, suppose 10: it then appears, that the state of the hygrometer is thus, 3 degrees and 10 hundredths of another. If the whole 10 divisions of the card have passed the line *E*, the lower card *G* will have revolved 10 times, or 10 hundred parts, equal to 1000; the accuracy to which the principle of this simple contrivance answers. Before use, the hygrometer should be adjusted; to do which, the cards *F* and *G* are first set to the line *E* at the 0 of each, or commencement of the graduations: whatever direction the cards afterwards take, it must evidently be from the change to greater moisture or dryness in the air; and they will accordingly point it out.

On this principle, but with a degree of ingenuity and pains perhaps never before employed, an hygrometer has been constructed by M. de Saussure, professor of philosophy at Geneva. In his *Essais sur l’Hygrometrie*, in 4to, 1783, is an important detail on the subject of *hygrometry*; from which the following description of his hygrometer is taken. The author found by repeated experiments, that the difference between the greatest extension and contraction of a *hair*, properly prepared, and having a weight of about three grains suspended to it, is nearly $\frac{1}{100}$ of its whole length; that is, $3\frac{1}{2}$, or $3\frac{1}{2}$ lines in a foot. This circumstance suggested the idea of a new hygrometer: and, in order to render those small variations perceptible and useful, the following apparatus was constructed.

Fig. 7. is a representation of the whole instrument, with the hair and other appendages complete. The lower extremity of the hair *ab* is held by the chaps of the screw pincers *b*. These pincers are represented aside at *B*: by a screw at its end, it fastens into the nut of the bottom plate *C*. This nut of the plate turns independently of the piece that supports it, and serves to raise or depress the pincers *B* at pleasure.

The upper extremity *a* of the hair is held by the under chaps of the double pincers *a*, represented aside at *A*. These pincers fasten the hair below, and above fasten a very fine narrow slip of silver, carefully annealed, which rolls round the arbor or cylinder *d*, a separate figure of which is shown at *DF*. This arbor, which carries the needle or index *ee*, or *E* in the separate figure, is cut into the shape of a screw; and the intervals of the threads of this screw have their bases flat, and are cut squarely so as to receive the slip of silver that is fastened to the pincers *a*, and joined in this manner with the hair. M. Saussure observes, that hair alone fixed immediately to the arbor would not do; for it curled upon it, and acquired a stiffness that the counterpoise was not able to surmount. The arbor was cut in a screw form, in order that the slip of silver in wind-

ing upon it should not increase the diameter of the arbor, and never take a situation top oblique and variable. The slip is fixed to the arbor by a small pin F. The other extremity of the arbor D is shaped like a pulley, flat at the bottom so as to receive a fine supple filken string, to which is suspended the counterpoise *g* in the large figure, and G in the side one. This counterpoise is applied to distend the hair; and acts in a contrary direction to that of the hair, and the moveable pincers to which the hair is fixed. If then the hair should be loaded with the weight of four grains, the counterpoise must weigh four grains more than the pincers. The arbor at one end passes through the centre of the dial, and turns therein, in a very fine hole, on a pivot made very cylindrical and well polished: at the other end is also a similar pivot, which turns in a hole made in the end of the arm *h* of the cock *hi*, HI. This cock is fixed behind the dial by means of the screw I.

The dial *k e e k*, divided into 360 degrees, is supported by two arms *ll*; these are soldered to two tubes, which inclose the cylindrical columns *mmmm*. The setting screws *nn* move upon these tubes, and serve thereby to fix the dial and arbor to any height required. The two columns which support the dial are firmly fastened to the case of the hygrometer, which rest upon the four screws *oooo*; by the assistance of these screws, the instrument is adjusted, and placed in a vertical situation.

The square column *pp*, which rests upon the base of the hygrometer, carries a box *q*, to which is fixed a kind of port-crayon *r*, the aperture of which is equal to the diameter of the counterpoise *g*. When the hygrometer is to be moved from one place to another; to prevent a derangement of the instruments from the oscillations of the counterpoise, the box *q* and the port-crayon *r* must be raised up so as the counterpoise may fall into and be fixed in it, by tightening the screw *s* and the box and counterpoise together by the screw *t*. When the hygrometer is intended for use, the counterpoise must be disengaged by lowering the box, as may be conceived from the figure.

Lastly, at the top of the instrument is a curved piece of metal *x, y, z*, which is fastened to the three columns just described, and keeps them together. It has a square hole at *y*, which serves to hang up the hygrometer by when required.

The variations of which this hygrometer is capable, are (all things besides equal) as much greater as the arbor round which the slip of silver winds is than a smaller diameter, and as the instrument is capable of receiving a longer hair. M. Saussure has had hygrometers made with hairs 14 inches long, but he finds one foot sufficient. The arbor is three-fourths of a line in diameter at the base between the threads of the screw or the part on which the slip winds. The variations, when a hair properly prepared is applied to it, are more than an entire circumference, the index describing about 400 degrees in moving from extreme dryness to extreme humidity. M. Saussure mentions an inconvenience attending this hygrometer, viz. its not returning to the same point when moved from one place to another; because the weight of three grains that keeps the silver slip extended, cannot play so exactly as to act always with the same precision against the

arbor round which it winds. But this weight cannot be sensibly increased without still greater inconveniences: he therefore observes, that his hygrometer is well calculated for a fixed situation in an observatory, and for various hygrometrical experiments; since, instead of the hair, there may be substituted any other substance of which a trial may be wanted; and it may be kept extended by a counterpoise more or less heavy as they may require: but the instrument will not admit of being moved, nor serve even for experiments which may subject it to agitation.

To obviate the objection above-mentioned, M. Saussure has contrived another apparatus more portable and convenient, and which, if not so extensive in its variations, is in fact very firm, and not in the least liable to be deranged by carriage and agitation. Fig. 8. is a representation of this hygrometer, which he calls the portable hygrometer, in distinction from the preceding, which he calls the great hygrometer or the hygrometer with the arbor. The material part of this instrument is its index *abce*; an horizontal view of which, and the arm that carries it, is seen in the separate figure GBDEF. This index carries in its centre D a thin tube hollow throughout, and projects out on each side of the needle. The axis which passes through it, and round which the index turns, is made thin in the middle of its length and thick at the ends; so that the cylindrical tube which it passes through touches it only at two points, and acts upon it only at its extremities.

The part *de* DE of the index serves to point out and mark on the dial the degrees of moisture and dryness; the opposite part *db* DB serves to fix both the hair and counterpoise. This part, which terminates in a portion of a circle, and is about a line in thickness, is cut on its edge in a double vertical groove, which makes this part similar to the segment of a pulley with a double neck. These two grooves, which are portions of a circle of two lines radius, and have the same centre with that of the index *d*, serve in one of them to contain the hair, and in the other the silk, to the end of which the counterpoise is suspended. The same index carries vertically above and below its centre two small screw-pincers, situated opposite to the two grooves: that above at *a*, opposite to the hindmost groove, serves to fix to the silk to which the counterpoise is suspended; and that below at *b*, opposite to the hithermost groove, serves to hold one of the ends of the hair. Each of these grooves has its partitions cut, as seen in the section B, and its bottom made flat, in order that the hair and silk may have the greatest freedom possible. The axis of the needle DD goes through the arm *gf* GF, and it is fixed to this arm by the tightening screw *f* F. All the parts of the index should be in perfect equilibrium about its centre; so that when it is on its pivot without the counterpoise, it will rest indifferently in any position. it may be placed in.

It must be understood, that when the hair is fixed by one of its extremities in the pincers *e*, and by the other end on the pincers *y* at the top of the instrument, it passes in one of the necks of the double pulley *b*, whilst the counterpoise to which the silk is fixed in *a* passes in the other neck of the same pulley: the counterpoise serves to keep the hair extended, and acts always in the same direction and with the same force, whatever.

Hygrometer.

Hygrometer.

Portable hygrometer by M. Saussure.

Hygrom-
ter.

whatever the situation of the index may be. When therefore the dryness contracts the hair, it overpowers the gravity of the counterpoise, and the index descends: when, on the contrary, the humidity relaxes the hair, it gives way to the counterpoise, and the index ascends. The counterpoise should weigh but three grains; so that the index should be made very light and very easy in its motion, in order that the least possible force may move it and bring it back again to its point when drawn aside.

The dial *h e h* is a circular arch, the centre of which is the same with that of the index. This arch is divided into degrees of the same circle, or into the hundredths of the interval which is found between the limits of extreme dryness and extreme humidity. The interior edge of the dial carries at the distance *h i* a kind of projecting bridle or stay *i i*, made of brass wire, curved to the arch, and fixed in the points *i i*. This bridle retains and guards the index, at the same time leaving it to play with the requisite freedom. The screw-pincers *y*, in which is fastened the upper extremity of the hair, is carried by a moveable arm, which ascends and descends at pleasure the length of the frame *KK*. This frame is cylindrical everywhere else, except its being here flattened at the hinder part to about half its thickness, in order that the piece with the screw which carries the arm should not project out underneath, and that the arm may not turn. The arm may be stopped at any desired height by means of the pressing screw *x*. But as it is of use sometimes to be able to give the instrument a very small and accurate motion, so as to bring the index exactly to the part that may be wanted, the slide piece *l*, which carries the pincers *y*, to which the hair is fixed, is to be moved by the adjusting screw *m*.

At the base of the instrument is a great lever *n o p q*, which serves to fix the index and its counterpoise when the hygrometer is to be moved. The lever turns an axis *n*, terminated by a screw which goes into the frame; in tightening this screw, the lever is fixed in the desired position. When the motion of the index is to be stopped, the intended position is given to this lever, as represented in the dotted lines of the figure. The long neck *p* of the lever lays hold of the double pulley *b* of the index, and the short neck *o* of the counterpoise: the tightening screw *q* fastens the two necks at once. In confining the index, it must be so placed, that the hair be very slack; so that, if whilst it is moved the hair should get dry, it may have room to contract itself. Afterwards, when the instrument is placed for use, the first thing to be done is to relax the screw *n*, and turn back the double lever with great care, taking equal caution at the same time not to strain the hair. It is better to apply one hand to the index near its centre, whilst the other hand is dilating the pulley and the counterpoise from the lever that holds them steady. The hook *r* serves to suspend a thermometer upon; it should be a mercurial one, with a very small naked bulb or ball, so as to show in the most sensible manner the changes of the air: it should be mounted in metal, and guarded in such a manner as not to vibrate so as to break the hair. Lastly a notch is made under the top of the frame *s*, to mark the point of suspension, about which the instrument is in equilibrium, and keeps a vertical situation.

Hygrom-
ter.

All the instrument should be made of brass: though the axis of the index and its tube work more pleasantly together if made of bell-metal.

The extent of this hygrometer's variations is not more than the fourth or fifth part of the hygrometer with the arbor. It may be augmented by making the segment of the pulley to which the hair is fixed of a smaller diameter; but then the hair, in moving about it, would fret and contract a stiffness, which would cause it to adhere to the bottom of the neck. M. Saussure is of opinion, that the radius of this pulley should not be less than two lines, at least that there should be adapted a plate of silver or some other contrivance; but then the hygrometer would be too difficult to construct, and it would require too much attention and care on the part of those who use it: his object was, to make an instrument generally useful, and easy and convenient in its use. The hygrometer with the arbor may be used for observations which require an extreme sensibility.

The variations of this instrument may be augmented by making it higher, because in that case longer hairs might be adapted: but it would be then less portable. Besides, if the hair is too long when observations are made in the open air, the wind has too great an effect upon it, and thus communicates to the index inconvenient vibrations. It is not proper therefore to make it more than a foot in height. When it is of this dimension, an hair properly prepared can be applied to it, and its variations from extreme dryness to extreme humidity are 80 or even 100 degrees; which on a circle of 3 inches radius forms an extent sufficient for observations of this kind. M. Saussure has even made smaller instruments that may be carried conveniently in the pocket, and to make experiments with under small receivers: they were but seven inches high by two inches of breadth; which, notwithstanding their variations, were very sensible.

Thus much for the construction of the various parts of the instrument. The limits of this work will not admit of our inserting the whole of M. Saussure's subsequent account of the preparation of the hair, the manner of determining the limits of extreme humidity and of extreme dryness, the pyrometrical variations of the hair, and the graduation of the hygrometer. The following abstract must therefore suffice.

In the preparation of the hair, it was found necessary to free it of a certain unctuousity it always has in its natural state, which in a great measure deprives it of its hygrometrical sensibility. A number of hairs are boiled in a ley of vegetable alkali; and among these are to be chosen for use such as are most transparent, bright, and soft: particular precautions are necessary for preventing the straining of the hair, which renders it unfit for the intended purpose.

The two fixed points of the hygrometer are the extremes both of moisture and dryness. The former is obtained by exposing the instrument to air completely saturated with water; and this is effected by placing it in a glass receiver standing in water, the sides of which are kept continually moistened. The point on the dial, at which the hand after a certain interval remains stationary, is marked 100. The point of extreme dryness, not absolute dryness, for that does not exist,

Hygrom-
ter.

exist, but the greatest degree of it that can be obtained, is produced by introducing repeatedly into the same receiver containing the instrument, and standing now upon quicksilver, certain quantities of deliquescent alkaline salts, which absorb the moisture of the air. The highest point to which the hand can be brought by this operation, not only when it will rise no higher, but when it becomes retrograde from the dilatation occasioned by heat, is called \circ ; and the arch between these two points is divided into 100 equal parts, being degrees of the hygrometer. The arch $\rho\rho$, upon which the scale is marked in the instrument (represented in fig. 2.) being part of a circle of three inches diameter; hence every degree measures about one third of a line. In the stationary hygrometer, fig. 1. the scale upon the complete circular dial is so much larger, that every degree measures about five lines; but this M. Saussure considers as far from being a perfection, that it is rather an inconvenience; since the instrument becomes thereby so very susceptible of the least impression, that there is even no approaching it without a sensible variation. The thermometer, adapted as before mentioned, serves to correct the changes of temperature: towards the extreme of dryness, 1° of the thermometer produces on the hair an effect of half a degree of the hygrometer, but towards the extreme of moisture, the same difference of temperature causes an effect no less than 3° on the hygrometer. He constructed two tables, that gave the intermediate hygrometrical variations for single degrees of the thermometer at different parts of the scale.

The whole range of the atmospherical variations takes in about 75° of this scale; a dryness of more than 25° being always the effect of art. The sensibility of this instrument is so very great, that being exposed to the dew, he mentions that it varies above 40° in about 20 minutes of time. Being removed from a very moist into a very dry air, it varied in one instance no less than 35° in three minutes. He says that its variations were always found uniform in different instruments suspended in different parts of the same atmosphere. This hygrometer is considered by the author as possessed of all the properties requisite in such an instrument. These are, 1. That the degrees in the scale be sufficiently large, and to point out even the least variation in the dryness or moisture of the atmosphere. 2. That it be quick in its indications. 3. That it be at all times consistent with itself; viz. that in the same state of the hair it always points to the same degree. 4. That several of them agree with one another. 5. That it be affected only by the aqueous vapours. 6. That its variations be ever proportionate to the changes in the air.

But after all it must be observed, that a considerable degree of trouble and delicacy is requisite in the preparation of the hair, and it is very fragile; circumstances which may prevent it from coming into general use among common observers, although probably it may be the best in principle of any yet made.

Instead of hairs or cat-gut, of which hygrometers of the first kind are commonly made, Cassebois, a Benedictine monk at Mentz, proposed to make such hygrometers of the gut of a silk-worm. When that insect is ready to spin, there are found in it two vessels proceeding from the head to the stomach, to which

they adhere, and then bend towards the back, where they form a great many folds. The part of these vessels next the stomach is of a cylindrical form, and about a line in diameter. These vessels contain a gummy sort of matter from which the worm spins its silk; and, though they are exceedingly tender, means have been devised to extract them from the insect, and to prepare them for the above purpose. When the worm is about to spin, it is thrown into vinegar, and suffered to remain there twenty-four hours; during which time the vinegar is absorbed into the body of the insect, and coagulates its juices. The worm being then opened, both the vessels, which have now acquired strength, are extracted; and, on account of their pliability, are capable of considerable extension. That they may not, however, become too weak, they are stretched only to the length of about fifteen or twenty inches. It is obvious that they must be kept sufficiently extended till they are completely dry. Before they attain to that state, they must be freed, by means of the nail of the finger, from a slimy substance which adheres to them. Such a thread will sustain a weight of six pounds without breaking, and may be used for an hygrometer in the same manner as cat-gut; but we confess that we do not clearly perceive its superiority.

II. On the second general principle, namely, that of the swelling of solid bodies by moisture, and their contraction by dryness, M. de Luc's instrument is the best. He makes choice of ivory for the construction of his hygrometer, because he finds that, being once wetted, ivory regularly swells by moisture, and returns exactly to the same dimensions when the moisture is evaporated, which other bodies do not. This hygrometer is represented in fig. 9. where $aa b$ is an ivory tube open at the end aa , and close at b . It is made of a piece of ivory taken at the distance of some inches from the top of a pretty large elephant's tooth, and likewise at the same distance from its surface and from the canal which reaches to that point. (This particular direction is given, that the texture of the ivory in all different hygrometers may be the same, which is of great importance.) This piece is to be bored exactly in the direction of its fibres; the hole must be very straight, its dimensions $2\frac{1}{2}$ lines in diameter, and 2 inches 8 lines in depth from aa to c . Its bore is then to be exactly filled with a brass cylinder, which, however, must project somewhat beyond the ivory tube; and thus it is to be turned on a proper machine, till the thickness of the ivory is exactly $\frac{1}{8}$ of a line, except at the two extremities. At the bottom b the tube ends in a point; and at the top aa it must for about two lines be left a little thicker, to enable it to bear the pressure of another piece put upon it. Thus the thin or hygrometrical part of the tube will be reduced to $2\frac{1}{2}$ French inches, including the concavity of the bottom. Before this piece is used, it must be put into water, so that the external part alone may be wetted by it; and here it is to remain till the water penetrates to the inside, and appears in the form of dew, which will happen in a few hours. The reason of this is, that the ivory tube remains somewhat larger ever after it is wetted the first time.

For this hygrometer, a glass tube must be provided about 14 inches long, the lower end of which is shown in $d d e e$. Its internal diameter is about $\frac{1}{4}$ of a line.

Hygrom-
ter.

Hygrom-
ter. If now the ivory tube is exactly filled with mercury, and the glass one affixed to it, as the capacity of the former decreases by being dried, the mercury will be forced up into the glass one.

The piece *ffgg* is intended to join the ivory with the glass tube. It is of brass, shaped as in the figure. A cylindrical hole is bored through it, which holds the glass tube as tight as possible without danger of breaking it; and its lower part is to enter with some degree of difficulty into the ivory pipe. To hinder that part of the tube which incloses the brass piece from being affected by the variations of the moisture, it is covered with a brass vessel represented in *hhi*. The pieces must be united together with gum-lac or mastich.

The introduction of the mercury is the next operation. For this purpose, a slip of paper three inches wide is first to be rolled over the glass tube, and tied fast to the extremity nearest the ivory pipe. A horse-hair is then to be introduced into the tube, long enough to enter the ivory pipe by an inch, and to reach three or four inches beyond the extremity of the glass one. The paper which has been shaped round the tube must now be raised, and used as a funnel to pour the mercury into the instrument, which is held upright. The purest quicksilver is to be used for this purpose, and it will therefore be proper to use that revived from cinna-bar. It easily runs into the tube; and the air escapes by means of the horse-hair, assisted with some gentle shakes. Fresh mercury must from time to time be supplied, to prevent the mercurial tube from being totally emptied; in which case, the mercurial pellicle which always forms by the contact of the air, would run in along with it.

Some air-bubbles generally remain in the tube; they may be seen through the ivory pipe, which is thin enough to have some transparency. These being collected together by shaking, must be brought to the top of the tube, and expelled by means of the horse-hair. To facilitate this operation, some part of the mercury must be taken out of the tube, in order that the air may be less obstructed in getting out, and the horse-hair have a free motion to assist it. Air, however, cannot be entirely driven out in this manner. It is the weight of the mercury with which the tube is for that reason to be filled, which in time completes its expulsion, by making it pass through the pores of the ivory. To hasten this, the hygrometers are put into a proper box. This is fixed nearly in a vertical direction to the saddle of a horse, which is set a trotting for a few hours. The shakes sometimes divide the column of mercury in the glass tube, but it is easily re-united with the horse-hair. When upon shaking the hygrometer vertically, no small tremulous motion is any longer perceived in the upper part of the column, one may be sure that all the air is gone out.

The scale of this hygrometer may be adjusted, as soon as the air is gone out, in the following manner. The instrument is to be suspended in a vessel of water cooled with ice, fresh quantities of which are to be added as the former melts. Here it is to remain till it has sunk as low as it will sink by the enlargement of the capacity of the ivory tube, owing to the moisture it has imbibed. This usually happens in seven or eight hours, and is to be carefully noted. In two or three

Hygrom-
ter. hours the mercury begins to ascend, because the moisture passes into the cavity, and forces it up. The lowest station of the mercury is then to be marked 0; and for the more accurate marking the degrees on the scale, M. de Luc always chose to have his hygrometrical tube made of one which had formerly belonged to a thermometer. The reason of this is, that in the thermometer the expansion of the mercury by heat had been already determined. The distance between the thermometrical points of melting ice and boiling water at 27 French inches of the barometer was found to be 1937 parts. The bulb of this preparatory thermometer was broke in a basin, in order to receive carefully all the mercury that it contained. This being weighed in nice scales amounted to 1428 grains. The hygrometer contained 460 grains of the same mercury. Now it is plain, that the extent of the degrees on the hygrometer, ought to be to that of the degrees on the preparatory thermometer as the different weights of the mercury contained in each; consequently 1428 : 460 : 1937 : 624 nearly; and therefore the corresponding intervals ought to follow the same proportion: and thus the length of a scale was obtained, which might be divided into as many parts as he pleased.

Fig. 10. is a representation of De Luc's hygrometer when fully constructed. In elegance it far exceeds Smeaton's or any other, and probably also in accuracy; for by means of a small thermometer fixed on the board along with it, the expansion of the mercury by heat may be known with great accuracy, and of consequence how much of the height of the mercury in the hygrometer is owing to that cause, and how much to the mere moisture of the atmosphere.

M. de Luc having continued his inquiries further into the modifications of the atmosphere, mentions in his *Idee sur la Météorologie* another hygrometer, which he finds to be the best adapted to the *measure* of local humidity. Of all the hygroscopic substances which he tried for this purpose, that which answers the best is a slip of whalebone cut transversely to the direction of the fibres, and made extremely thin; for on this depends its sensibility. A slip of 12 inches in length and a line in breadth, he has made so thin as to weigh only half a grain; and it may be made still thinner, but is then of too great sensibility, being affected even by the approach of the observer. This slip is kept extended by a small spring, and the variations in its length are measured by a vernier division, or by, which is perhaps better, an index on a dial plate: the whole variation from extreme dryness to extreme moisture is about $\frac{1}{3}$ of its length.

In these hygrometers, which are made by the instrument-makers in London, the slip of whalebone is mounted in a frame very similar to that belonging to M. Saussure's hygrometer before described (see fig. 7.) The only material difference is, that a small concentric wire spring is used, instead of a counterpoise, to keep the slip of whalebone extended. M. Saussure had tried such a spring applied to his hairs; but the weakest spring he found too strong for the hair; and he was further apprehensive, that the variations which the cold, heat, and the weather infallibly make, would suffer from the force of the springs.

M. de Luc, in the hygrometers he formerly made, as before described (made of ivory), had graduated them from

Hygrometer. from one fixed point only, that of extreme *moisture*, which is obtained by soaking them in water. He has now very ingeniously contrived to fix the other extreme, that of *dryness*: but this being producible only by means of strong fires, such as hygrometers cannot support, he uses an intermediate body, quicklime; which after having been deprived, by force of fire, of all its own humidity, has the property of slowly imbibing humidity again from the bodies in its neighbourhood; and whose capacity is such that all the vapour that can be contained in a quantity of air equal to its own bulk, can give it no sensible humidity. These hygrometers, inclosed with a large quantity of fresh burnt lime in lumps, acquire in three weeks the same degree of dryness with the lime, which cannot differ sensibly from extreme *dryness*.

M. de Saussure makes choice of hairs, prepared by maceration in alkaline lye. M. de Luc shows that hairs, and all other animal or vegetable substances, taken *lengthwise*, or in the direction of their fibres, undergo *contrary* changes from different variations of humidity; that, when immersed in water, they lengthen at first, and afterwards shorten; that when they are near the greatest degree of humidity, if the moisture is increased, they shorten themselves; if it is diminished, they lengthen themselves first before they contract again. These irregularities, which obviously render them incapable of being true measures of humidity, he shows to be the necessary consequence of their organic reticular structure.

M. de Saussure takes his point of extreme moisture from the vapours of water under a glass bell, keeping the sides of the bell continually moistened: and affirms, that the humidity is there constantly the same in all temperatures: the vapours even of *boiling* water having no more effect than those of cold. M. de Luc shows, on the contrary, that the differences of humidity under the bell are very great, though M. Saussure's hygrometer was incapable of discovering them; and that the real undecomposed vapour of boiling water has the directly opposite effect to that of cold, the effect of extreme *dryness*: and on this point he mentions an interesting fact, communicated to him by Mr Watt, viz. that wood cannot be employed in the steam engine for any of those parts where the vapour of the boiling water is confined, because it dries so as to crack, just as if exposed to the fire. In M. de Luc's work above mentioned there are striking instances related, in which the imperfection of M. Saussure's hygrometer led him into false conclusions respecting phenomena, and into erroneous theories to account for them.

III. On the third principle, namely, the alteration of the weight of certain substances by their attracting the moisture of the air, few attempts have been made, nor do they seem to have been attended with much success. Sponges dipped in a solution of alkaline salts, and some kinds of paper, have been tried. These are suspended to one end of a very accurate balance, and counterpoised by weights at the other, and show the degrees of moisture or dryness by the ascent or descent of one of the ends. But, besides that such kinds of hygrometers are destitute of any fixed point from whence to begin their scale, they have another inconvenience (from which indeed Smeaton's is not free, and

which has been found to render it erroneous), namely, that all saline substances are destroyed by long continued exposure to the air in very small quantities, and therefore can only imbibe the moisture for a certain time. Sulphuric acid has therefore been recommended in preference to the alkaline or neutral salts, and, indeed, for such as do not choose to be at the trouble of constructing a hygrometer on the principles of Mr Smeaton or De Luc, this will probably be found the most easy and accurate. Fig. 11. represents an hygrometer of this kind. A is a small glass cup containing a small quantity of oil of vitriol, B an index counterpoising it, and C the scale; where it is plain, that as the oil of vitriol attracts the moisture of the air, the scale will descend, which will raise the index, and *vice versa*. This liquor is exceedingly sensible of the increase or decrease of moisture. A single grain, after its full increase, has varied its equilibrium so sensibly that the tongue of a balance, only an inch and a half long, has described an arch, one-third of an inch in compass (which arch would have been almost three inches if the tongue had been one foot), even with so small a quantity of liquor; consequently, if more liquor, expanded under a large surface, were used, a pair of scales might afford as nice an hygrometer as any kind yet invented. A great inconvenience, however, is, that as the air must have full access to the liquid, it is impossible to keep out the dust, which, by continually adding its weight, must render the hygrometer false; add to this, that even oil of vitriol itself is by time destroyed, and changes its nature, if a small quantity of it is continually exposed to the air.

The best hygrometer upon this principle, and for ascertaining the quantity as well as the degree of moisture in the variation of the hygrometer, is of the contrivance of Mr Coventry, Southwark, London. The account he has favoured us with is as follows. "Take two sheets of fine tissue paper, such as is used by hatters; dry them carefully at about two feet distance from a tolerably good fire, till after repeatedly weighing them in a good pair of scales no moisture remains. When the sheets are in this perfectly dry state, reduce them to exactly 50 grains; the hygrometer is then fit for use. The sheets must be kept free from dust, and exposed a few minutes in the open air; after which it may be always known by weighing them the exact quantity of moisture they have imbibed.

"For many years the hygrometer has (says Mr Coventry) engrossed a considerable share of my attention; and every advantage proposed by others, either as it respected the substances of which the instrument was composed, or the manner in which its operations were to be discerned, has been impartially examined. But (adds he) I have never seen an hygrometer so simple in itself, or that would act with such certainty or so equally alike, as the one I have now described. The materials of which it is composed being thin, are easily deprived wholly of their moisture; which is a circumstance essentially necessary in fixing a *datum* from which to reckon, and which, I think, cannot be said of any substance hitherto employed in the construction of hygrometers; with equal facility they imbibe or impart the humidity of the atmosphere, and show with the greatest exactness when the least alteration takes place."

Hygrom-
ter.

When the paper is prepared, as already described, it will serve, without the trouble of drying, as a standard for any number of sheets intended for the same purpose. But then the sheets must be kept together in the open air for a few hours; because whatever alteration may take place by this exposure, the paper already weighed must have undergone the same; being consequently in the same state, they must be cut to the same weight.

For easier weighing the paper, take a piece of round tin or brass the size of a crown-piece, through the centre of which drill a hole, and also three others round it at equal distances: then cut about one hundred papers; and after putting them under the tin or brass, drive through each hole a strong pin into a board, in order to round them to the shape of the plate: the papers must be then separated and exposed to the air a few hours with that already weighed, and so many of them taken as are equal to the weight already specified. This done, threadle them together through those holes made by the pins, putting between every paper on each thread a small bead, in order to prevent the papers from touching each other, and also that the air may be more readily admitted. The top of the hygrometer is covered with a card cut to the same size; and which, by reason of its stiffness, supports all the papers, and keeps them in proper shape. Before the papers are threaded, the beads, silk, card, and a thin piece of brass about the size of a sixpence, which must be placed at the bottom, and through which the centre string passes, must be weighed with the greatest exactness, in order to bring them to a certain weight, suppose 50 grains; now the paper in its driest state being of equal weight, they will weigh together 100 grains, consequently what they weigh more at any time is moisture.

To obviate the trouble and difficulty of making experiments with weights and scales, Mr Coventry contrived a machine or scale by which to determine at one view the humidity or dryness of the atmosphere. This, with its case, is represented by fig. 12. The front and back of the case are glass; the sides fine gauze, which excludes the dust and admits the air; the case is about ten inches high, 8 inches broad, and 4 inches deep. A, a brass bracket in front, behind which, at about $3\frac{1}{2}$ inches distance, is another; these support the axis of the index E, also of the beam D, and another which supports the stem B, to which the ivory scale of divisions C is fixed. G, a brass scale suspended in the usual manner to the end of a beam D, and weighing exactly 100 grains. This scale is an exact counterpoise to the papers I and the different apparatus. The particular manner of suspension in this balance is, from the construction, as follows: The axis of the beam *g*, which is made of brass, instead of hanging on pivots, as in common scales, turns with two steel edges *k k*, fixed in the extremities of the brass axis: these edges are shaped like the edge of a knife, and act on two steel concave edges *ll*, in order to render the friction as small as possible. D, is a fine scale beam fixed at right angles with the axis *g*. E, the steel index fixed to the under side of the same axis. F, a brass sliding weight: *h* is the axis that holds the stem B to which the scale of divisions C is fixed. AA, the brass brackets which support the whole by four

screws, two of which are seen at *ii*; that screw the brackets to the top of the case. The axis of the scale of divisions is hung on pivots, one of which is seen at *m*, that, should the case not stand level, the stem B may always be in a perpendicular situation.

The hygrometer, before use, should be adjusted as follows: To the end of the beam where the hygrometer is suspended, hang a weight of 100 grains, which is equal to the weight of the scale; then move the sliding weight F up or down the index E, till one grain will cause the index to traverse neither more nor less than the whole scale of divisions; then add half a grain to the scale, in order to bring the index to 0; and the instrument, after taking off the 100 grain weight and hanging on the papers, is fit for use; then put grain weights in the scale till the index is brought within compass of the scale of divisions. Example: H is 3 grains on the brass scale, and the index points at 10; consequently there is 3 grains and 10 hundredths of a grain of moisture in the papers. If four grain weights are kept, viz. 1, 2, 4, and 5, they will make any number from 1 to 9, which are as many as will be wanted. Sometimes the index will continue traversing within the scale of divisions for many days without shifting the weights; but if otherwise, they must be changed as occasion may require.

“One great advantage of this hygrometer above all others that have attracted my notice is (says Mr Coventry), that it acts from a certain *datum*, namely, the dry extreme; from which all the variations towards moist are calculated with certainty: and if constructed with that precision represented by the drawing, it will afford pleasure to the curious in observing the almost perpetual alteration of the atmosphere, even in the most settled weather. In winter it will be constantly traversing from about eight in the morning till four or five in the afternoon, towards *dry*; and in summer, from about four in the morning till six or seven in the evening, when the weather is hot and gloomy, the hygrometer discovers a very great change towards moisture; and when clear and frosty, that it contains a much greater quantity of moisture than is generally imagined.”

An improvement has been proposed of this kind of hygrometer, of which the following circumstance, it is said, suggested the first hint. While Mr Lowitz was at Dmitriewsk in Astracan, he found on banks of the Wolga, a thin bluish kind of slate which attracted moisture remarkably soon, but again suffered it as soon to escape. A plate of this slate weighed, when brought to a red heat, 175 grains, and, when saturated with water, 247: it had therefore imbibed, between complete dryness and the point of complete moisture, 72 grains of water. Lowitz suspended a round thin plate of this slate at the end of a very delicate balance, fastened within a wooden frame, and suspended at the other arm a chain of silver wire, the end of which was made fast to a sliding nut that moved up and down in a small groove on the edge of one side of the frame. He determined, by trial, the position of the nut when the balance was in equilibrio and when it had ten degrees of over-weight, and divided the space between these two points into ten equal parts, adding such a number more of these parts as might be necessary. When the stone was suspended from the one arm

Hygro- of the balance, and at the other a weight equal to 175 grains, or the weight of the stone when perfectly dry, the nut in the groove shewed the excess of weight in grains when it and the chain were so adjusted that the balance stood in equilibrio. A particular apparatus on the same principles as a vernier, applied to the nut, shewed the excess of weight to ten parts of a grain. Lowitz remarked that this hygrometer in continued wet weather gave a moisture more than 15 grains, and in a continued heat of 113 degrees of Fahrenheit only $1\frac{1}{2}$ degree of moisture.

The hygrometer thus invented by Lowitz was, however, attended with this fault, that it never threw off the moisture in the same degree as the atmosphere became drier. It was also sometimes very deceitful, and announced moisture when it ought to have indicated that dryness had again begun to take place in the atmosphere. To avoid these inconveniences, M. Hochheimer proposes the following method :

1. Take a square bar of steel about two lines in thickness, and from ten to twelve inches in length, and form it into a kind of balance, one arm of which ends in a screw. On this screw let there be screwed a leaden bullet of a proper weight, instead of the common weights that are suspended. 2. Take a glass plate about ten inches long, and seven inches in breadth ; destroy its polish on both sides, free it from all moisture by rubbing it over with warm ashes, suspend it at the other end of the balance, and bring the balance into equilibrium by screwing up or down the leaden bullet. 3. Mark now the place to which the leaden bullet is brought by the screw, as accurately as possible, for the point of the greatest dryness. 4. Then take away the glass plate from the balance, dip it completely in water, give it a shake that the drops may run off from it, and wipe them carefully from the edge. 5. Apply the glass plate thus moistened again to the balance, and bring the latter into equilibrium by screwing the leaden bullet. Mark then the place at which the bullet stands as the highest degree of moisture. 6. This apparatus is to be suspended in a small box of well dried wood, sufficiently large to suffer the glass plate to move up and down. An opening must be made in the lid, exactly of such a size as to allow the tongue of the balance to move freely. Parallel to the tongue apply a graduated circle, divided into a number of degrees at pleasure, from the highest point of dryness to the highest degree of moisture. The box must be pierced with small holes on all the four sides, to give a free passage to the air ; and to prevent moisture from penetrating into the wood by rain, when it may be requisite to expose it at a window, it must either be lathered or painted. To save it at all times from rain, it may be furnished with a sort of roof.

For a description of Mr Leslie's Hygrometer, fig. 13. and in a more portable form, fig. 14. see METEOROLOGICAL Index.

HYGROSCOPE. The same with **HYGROMETER.**

HYLA, in *Ancient Geography*, a river of Mysia Minor, famous for Hylas the favourite boy of Hercules, who was carried down the stream and drowned. It is said to run by Prusa ; whence it seems to be the same with the *Rhyndacus*, which runs north-west into the Propontis.

HYLAS, in fabulous history, son of Thecodamus,

was ravished by the nymphs of a fountain as he was taking out some water for Hercules, by whom he was beloved. Hylozoists
Hylæen.

HYLOZOISTS, formed of *υλη* matter, *ζωη* life, the name of a sect of atheists among the ancient Greek philosophers, who held matter to be animated ; maintaining that matter had some natural perception, without animal sensation, or reflection in itself considered ; but that this imperfect life occasioned that organization whence sensation and reflection afterwards arose. Of these, some held only one life, which they called a PLASTIC nature, presiding regularly and invariably over the whole corporeal universe, which they represented as a kind of large plant or vegetable : these were called the cosmoplastic and stoical atheists, because the Stoics held such a nature, though many of them supposed it to be the instrument of the Deity. Others thought that every particle of matter was endued with life, and made the mundane system to depend upon a certain mixture of chance and plastic or orderly nature united together. These were called the *Stratonici*, from Strato Lampfacenus, a disciple of Theophrastus, called also Physicus (Cicero de Nat. Deor. lib. 1. cap. 13.) who was first a celebrated Peripatetic, and afterwards formed this new system of atheism for himself. Besides these two forms of atheism, some of the ancient philosophers were Hylopathians, or ANAXIMANDRIANS, deriving all things from dead and stupid matter, in the way of qualities and forms, generable and corruptible ; and others again adopted the ATOMICAL or Democritical system, who ascribe the production of the universe to atoms and figures. See on this subject *Cudworth's Intellectual System*, book i. chap. 3.

HYMEN, or **HYMENÆUS**, a fabulous divinity, the son of Bacchus and Venus Urania, was supposed by the ancients to preside over marriages ; and accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen*, or *Hymenæe* !

The poets generally crown this deity with a chaplet of roses ; and represent him, as it were, dissolved and enervated with pleasures, dressed in a yellow robe and shoes of the same colour, with a torch in his hand.—Catullus, in one of his epigrams, addresses him thus :

*Cinge tempora floribus
Suaveolentis amaraci.*

It was for this reason, that the new-married couple bore garlands of flowers on the wedding-day : which custom also obtained among the Hebrews, and even among Christians, during the first ages of the church, as appears from Tertullian, *De corona militari*, where he says, *Coronant et nuptæ sponfos*.—S. Chryostom, likewise mentions these crowns of flowers ; and to this day the Greeks call marriage *εσφαναμια*, in respect of this crown or garland.

HYMEN, *ὑμεν*, in *Anatomy*, a thin membrane or skin, sometimes circular, of different breadths, more or less smooth, and sometimes semilunar, formed by the union of the internal membrane of the great canal with that on the inside of the *alæ*, resembling a piece of fine parchment. This membrane is supposed to be stretched in the neck of the womb of virgins, below the nymphæ, leaving in some subjects a very small opening.

Hymen. in others a larger, and in all rendering the external orifice narrower than the rest of the cavity, and to be broke when they are deflowered; an effusion of blood following the breach.

The membranous circle may likewise suffer some disorder by too great a flux of the menses, by imprudence, levity, and other particular accidents.

The hymen is generally looked upon as the test of virginity; and when broke, or withdrawn, shows that the person is not in a state of innocence. This notion is very ancient. Among the Hebrews, it was the custom for the parents to save the blood shed on this occasion as a token of the virginity of their daughter, and to send the sheets next day to the husband's relations. And the like is said to be still practised in Portugal, and some other countries.

And yet authors are not agreed as to the existence of such a membrane. Nothing, Dr Drake observes, has employed the curiosity of anatomists, in dissecting the organs of generation in women, more than this part: they have differed not only as to its figure, substance, place, and perforation, but even its reality; some positively affirming, and others flatly denying it.

De Graaf himself, the most accurate inquirer into the structure of these organs, confesses he always sought it in vain, though in the most unsuspected subjects and ages: all he could find was, a different degree of straitness or wideness, and different corrugations, which were greater or less according to the respective ages; the aperture being still the less, and the rugosities the greater, as the subject was younger and more untouched.

Dr Drake, on the other hand, declares, that in all the subjects he had opportunity to examine, he does not remember to have missed the hymen so much as once, where he had reason to depend on finding it. The fairest view he ever had of it was in a maid who died at thirty years of age; in this he found it a membrane of some strength, furnished with fleshy fibres, in figure round, and perforated in the middle with a small hole, capable of admitting the end of a woman's little finger, and situated a little above the orifice of the urinary passage, at the entrance of the vagina of the womb.

In infants it is a fine thin membrane, not very conspicuous, because of the natural straitness of the passage itself, which does not admit of any great expansion in so little room; which might lead De Graaf into a notion of its being no more than a corrugation.

This membrane, like most others, does probably grow more distinct, as well as firm, by age. That it not only exists, but is sometimes very strong and impervious, may be collected from the history of a case reported by Mr Cowper. In a married woman, twenty years of age, whose hymen was found altogether impervious, so as to detain the menses, and to be driven out by the pressure thereof beyond the labia of the pudendum, not unlike a prolapsus of the uterus; on dividing it, at least a gallon of grumous blood came forth. It seems the husband, being denied a passage that way, had found another through the meatus urinarius; which was found very open, and its sides extended like the anus of a cock.

Upon a rupture of the hymen, after the consummation of marriage, and especially delivery, its parts,

shrinking up, are supposed to form those little fleshy knots, called *CARUNCULÆ myrtiformes*.

HYMENÆA, the BASTARD LOCUST TREE; a genus of plants, belonging to the decandria class; and in the natural method ranking under the 33d order, *Lomentaceæ*. See *BOTANY Index*.

HYMENÆAL, something belonging to marriage; so called from **HYMEN**.

HYMENOPTERA (derived from *ὑμην* membrane, and *πτερον* wing), in the Linnæan system of natural history, is an order of insects, having four membranaceous wings, and the tails of the females are furnished with stings, which in some are used for instilling poison, and in others for merely piercing the bark and leaves of trees, and the bodies of other animals, in which they deposit their eggs. See *ENTOMOLOGY Index*.

HYMETTUS, in *Ancient Geography*, a mountain of Attica near Athens, famous for its marble quarries, and for its excellent honey. *Hymettus* the epithet. Pliny says that the orator Crassus was the first who had marble columns from this place.

HYMN, a song or ode in honour of God; or a poem, proper to be sung, composed in honour of some deity.—The word is Greek, *ὑμνος* hymn, formed of the verb *ἕω celebro*, "I celebrate."—Isidore, on this word, remarks, that *hymn* is properly a song of joy, full of the praises of God; by which, according to him, it is distinguished from *threna*, which is a mourning song, full of lamentation.

St Hilary, bishop of Poitiers, is said to have been the first that composed hymns to be sung in churches, and was followed by St Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by Messieurs de Port Royal.—In the Greek Liturgy there are four kinds of hymns; but the word is not taken in the sense of a praise offered in verse, but simply of a laud or praise. The angelic hymn, or *Gloria in excelsis*, makes the first kind; the *trifagion* the second; the *Cherubic hymn*, the third; and the hymn of *victory* and *triumph*, called *επινικιος*, the last.

The hymns or odes of the ancients generally consisted of three sorts of stanzas; one of which, called *strophè*, was sung by the band as they walked from east to west; another, called *antistrophè*, was performed as they returned from west to east; the third part, or *epode*, was sung before the altar. The Jewish hymns were accompanied with trumpets, drums, and cymbals, to assist the voices of the Levites and people.

HYOBANCHE, a genus of plants belonging to the didynamia class. See *BOTANY Index*.

HYOIDES, in *Anatomy*, a bone placed at the root of the tongue. See *ANATOMY*, N° 28.

HYOSCYAMUS, HENBANE; a genus of plants belonging to the pentandria class, and in the natural method ranking under the 28th order, *Luridæ*. See *BOTANY* and *MATERIA MEDICA Index*.

HYOSERIS, a genus of plants belonging to the syngenesia class, and in the natural method ranking under the 49th order, *Compositæ*. See *BOTANY Index*.

HYO-THYROIDES, in *Anatomy*, one of the muscles belonging to the os hyoides. See *ANATOMY*, *Table of the Muscles*.

HYPALLAGE,

Hymenæa
||
Hyo-thyroides.

Hypallage
||
Hypatia.

HYPALLAGE, among grammarians, a species of hyperbaton, consisting in a mutual permutation of one case for another. Thus Virgil says, *Dare classibus austruos*, for *dare classes austris*; and again, *Nec dum illis labra admovi*, for *nec dum illa labris admovi*.

HYPANTE, or **HYPERPANTE**, a name given by the Greeks to the feast of the presentation of Jesus in the temple.—This word, which signifies *lowly* or *humble meeting*, was given to this feast from the meeting of old Simeon and Anna the prophets in the temple when Jesus was brought thither.

HYPATIA, a learned and beautiful lady of antiquity, the daughter of Theon a celebrated philosopher and mathematician, and president of the famous Alexandrian school, was born at Alexandria about the end of the fourth century. Her father, encouraged by her extraordinary genius, had her not only educated in all the ordinary qualifications of her sex, but instructed in the most abstruse sciences. She made such great progress in philosophy, geometry, astronomy, and the mathematics, that she passed for the most learned person of her time. At length she was thought worthy to succeed her father in that distinguished and important employment, the government of the school of Alexandria; and to teach out of that chair where Ammonius, Hierocles, and many other great men, had taught before; and this at a time too when men of great learning abounded both at Alexandria and in many other parts of the Roman empire. Her fame was so extensive, and her worth so universally acknowledged, that we cannot wonder if she had a crowded auditory. "She explained to her hearers (says Socrates) the several sciences that go under the general name of philosophy; for which reason there was a confluence to her from all parts of those who made philosophy their delight and study." One cannot represent to himself, without pleasure, the flower of all the youth of Europe, Asia, and Africa, sitting at the feet of a very beautiful lady (for such we are assured Hypatia was), all greedily swallowing instruction from her mouth, and many of them, doubtless, love from her eyes; though we are not sure that she ever listened to any solicitations, since Suidas, who talks of her marriage with Isidorus, yet relates at the same time that she died a maid.

Her scholars were as eminent as they were numerous; one of whom was the celebrated Synesius, who was afterwards bishop of Ptolemais. This ancient Christian Platonist everywhere bears the strongest, as well as the most grateful, testimony of the virtue of his tutors; and never mentions her without the most profound respect, and sometimes in terms of affection coming little short of adoration. But it was not Synesius only, and the disciples of the Alexandrian school, who admired Hypatia for her virtue and learning: never was woman more caressed by the public, and yet never woman had a more unspotted character. She was held as an oracle for her wisdom, which made her consulted by the magistrates in all important cases; and this frequently drew her among the greatest concourse of men, without the least censure of her manners. In a word, when Nicephorus intended to pass the highest compliment on the princess Eudocia, he thought he could not do it better than by calling her another *Hypatia*.

Hypocoum
||
Hyperbaton.

While Hypatia thus reigned the brightest ornament of Alexandria, Orestes was governor of the same place for the emperor Theodosius, and Cyril was bishop or patriarch. Orestes having had a liberal education, could not but admire Hypatia; and as a wife governor frequently consulted her. This, together with an aversion which Cyril had against Orestes, proved fatal to the lady. About 500 monks assembling, attacked the governor one day, and would have killed him, had he not been rescued by the townsmen; and the respect which Orestes had for Hypatia causing her to be traduced among the Christian multitude, they dragged her from her chair, tore her to pieces, and burned her limbs. Cyril is not clear from a suspicion of fomenting this tragedy. Cæcilius indeed endeavours to remove the imputation of such an horrid action from the patriarch; and lays it upon the Alexandrian mob in general, whom he calls *levissimum hominum genus*, "a very trifling inconstant people." But though Cyril should be allowed neither to have been the perpetrator, nor even the contriver of it, yet it is much to be suspected that he did not discountenance it in the manner he ought to have done: which suspicion must needs be greatly confirmed by reflecting, that he was so far from blaming the outrage committed by the monks upon Orestes, that he afterwards received the dead body of Ammonius, one of the most forward in that outrage, who had grievously wounded the governor, and who was justly punished with death. Upon this riotous ruffian Cyril made a panegyric in the church where he was laid, in which he extolled his courage and constancy, as one that had contended for the truth; and changing his name to *Thaumastus*, or the "Admirable," ordered him to be considered as a martyr. "However, (continues Socrates), the wisest part of Christians did not approve the zeal which Cyril showed on this man's behalf, being convinced that Ammonius had justly suffered for his desperate attempt."

HYPECOUM, **WILD CUMIN**, a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 24th order, *Gorydales*. See *BOTANY INDEX*.

HYPER, a Greek preposition frequently used in composition, where it denotes excess; its literal signification being *above*, or *beyond*.

HYPERBATON, in *Grammar*, a figurative construction inverting the natural and proper order of words and sentences. The several species of the hyperbaton are, the anastrophe, the hysteron-proteron, the hypallage, synchysis, tmesis, parenthesis, and the hyperbaton strictly so called. See *ANASTROPHE*, &c.

HYPERBATON, strictly so called, is a long retention of the verb which completes the sentence, as in the following example from Virgil:

*Interea Reges: ingenti mole Latinus
Quadrifugo velitur curru, cui tempora circum
Aurati bis sex radii fulgentia cingunt,
Solis avi specimen: bigis ut Turnus in albis,
Bina manu lato crispans hastilia ferro:
Hinc Pater Æneas, Romana stirpis origo,
Sidereo flagrans clypeo et cælestibus armis;
Et juxta Aescanius, magnæ spes altera Romæ:
Procedunt castris.*

HYPERBOLA,

Hyperbola,
Hyperbole.

Hyperbole.

HYPERBOLA, a curve formed by cutting a cone in a direction parallel to its axis. See CONIC SECTIONS.

HYPERBOLA Deficient, is a curve having only one asymptote, though two hyperbolic legs running out infinitely by the side of the asymptote, but contrary ways.

HYPERBOLE, in *Rhetoric*, a figure, whereby the truth and reality of things are excessively either enlarged or diminished. See ORATORY, N° 58.

An object uncommon with respect to size, either very great of its kind or very little, strikes us with surprize; and this emotion forces upon the mind a momentary conviction that the object is greater or less than it is in reality: the same effect precisely attends figurative grandeur or littleness; and hence the hyperbole, which expresses this momentary conviction. A writer, taking advantage of this natural delusion, enriches his description greatly by the hyperbole: and the reader, even in his coolest moments, relishes this figure, being sensible that it is the operation of nature upon a warm fancy.

It cannot have escaped observation that a writer is generally more successful in magnifying by a hyperbole than in diminishing. The reason is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with respect to a diminishing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedemonian letter." But, for the reason now given, the hyperbole has by far the greater force in magnifying objects; of which take the following example:

For all the land which thou see'st, to thee will I give it, and to thy seed for ever. And I will make thy seed as the dust of the earth: so that if a man can number the dust of the earth, then shall thy seed also be numbered. *Gen. xiii. 15. 16.*

*Ulla vel intactæ segetis per summa volaret
Gramina, nec teneras cursu læsisset aristas.*
Æneid. vii. 808.

—————*Atque imo barathri ter gurgite vastos
Sorbet in abruptum fluctus, rursusque sub auras
Erigit alternos, et sidera verberat unda.*
Æneid. iii. 421.

—————*Horrificis juxta tonat Ætna ruinis,
Interdumque atram prorumpit ad æthera nubem,
Turbine fumantem piceo et candente favilla:
Attollitque globos flammæ, et sidera lambit.*
Æneid. iii. 571.

Speaking of Polyphemus,

—————*Ipse arduus, altaque pulsat
Sidera.* *Æneid. iii. 619.*

—————When he speaks,
The air, a charter'd libertine, is still.
Henry V. act. i. sc. 1.

Now shield with shield, with helmet helmet clos'd,
To armour armour, lance to lance oppos'd,

Host against host with shadowy squadrons drew,
The sounding darts in iron tempests flew,
Victors and vanquish'd join promiscuous cries,
And thrilling shouts and dying groans arise;
With streaming blood the slipp'ry fields are dy'd,
And slaughter'd heroes swell the dreadful tide.

Iliad. iv. 508.

Quintilian is sensible that this figure is natural: "For (says he), not contented with truth, we naturally incline to augment or diminish beyond it; and for that reason the hyperbole is familiar even among the vulgar and illiterate;" and he adds, very justly, "That the hyperbole is then proper, when the object of itself exceeds the common measure." From these premises, one would not expect the following inference, the only reason he can find for justifying this figure of speech, *Conceditur enim amplius dicere, quia dici quantum est, non potest: meliusque ultra quam citra flat oratio.*" (We are indulged to say more than enough, because we cannot say enough; and it is better to be above than under.) In the name of wonder, why this slight and childish reasoning, when immediately before he had observed, that the hyperbole is founded on human nature? We could not resist this personal stroke of criticism; intended not against our author, for no human creature is exempt from error; but against the blind veneration that is paid to the ancient classic writers, without distinguishing their blemishes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected, let us proceed to the rules by which it ought to be governed. And, in the first place, it is a capital fault to introduce an hyperbole in the description of an ordinary object or event; for in such a case, it is altogether unnatural, being destitute of surprize, its only foundation. Take the following instance, where the subject is extremely familiar, viz. swimming to gain the shore after a shipwreck.

I saw him beat the surges under him,
And ride upon their backs: he trode the water;
Whose enmity he stung aside, and breasted
The surge most swollen that met him: his bold head
'Bove the contentious waves he kept, and oar'd
Himself with his good arms, in lusty strokes
To th' shore, that o'er his wave-born basis bow'd,
As stooping to relieve him. *Tempest, act. ii. sc. 1.*

In the next place, it may be gathered from what is said, that an hyperbole can never suit the tone of any dispiriting passion: sorrow in particular will never prompt such a figure; and for that reason the following hyperboles must be condemned as unnatural:

K. Rich. Aumerle, thou weep'st, my tender-hearted cousin!

We'll make foul weather with despised tears:
Our sighs, and they, shall lodge the summer-corn,
And make a dearth in this revolving land.
Richard II. act. iii. sc. 6.

Draw them to Tyber's bank, and weep your tears
Into the channel, till the lowest stream
Do kiss the most exalted shore of all.
Julius Caesar, act. i. sc. 1.
Thirdly,

Hyperbole. Thirdly, A writer, if he wish to succeed, ought always to have the reader in his eye: he ought, in particular, never to venture a bold thought or expression, till the reader be warmed and prepared. For this reason, an hyperbole in the beginning of a work can never be in its place. Example :

*Jam pauca aratro jugera regie
Moles relinquunt.* Horat. Carm. lib. ii. ode 15.

In the fourth place, The nicest point of all is, to ascertain the natural limits of an hyperbole, beyond which being overstrained, it has a bad effect. Longinus (chap. iii.), with great propriety of thought, enters a caveat against an hyperbole of this kind: he compares it to a bow-string, which relaxes by overstraining, and produceth an effect directly opposite to what is intended. To ascertain any precise boundary, would be difficult, if not impracticable. We shall therefore only give a specimen of what may be reckoned overstrained hyperboles. No fault is more common among writers of inferior rank; and instances are found even among those of the finest taste; witness the following hyperbole, too bold even for an Hotspur.

Hotspur talking of Mortimer :

In single opposition hand to hand,
He did confound the best part of an hour
In changing hardiment with great Glendower.
Three times they breath'd, and three times did they
drink,

Upon agreement, of swift Severn's flood;
Who then affrighted with their bloody looks,
Ran fearfully among the trembling reeds,
And hid his crisp'd head in the hollow bank,
Blood-stained with these valiant combatants.

First Part Henry IV. act i. sc. 4.

Speaking of Henry V.

England ne'er had a King until this time.
Virtue he had, deserving to command:
His brandish'd sword did blind men with its beams:
His arms spread wider than a dragon's wings:
His sparkling eyes, replete with awful fire,
More dazzled, and drove back his enemies,
Than mid-day sun fierce bent against their faces.
What should I say? his deeds exceed all speech:
He never lifted up his hand, but conquer'd.

First Part Henry VI. act i. sc. 1.

Lastly, An hyperbole, after it is introduced with all advantages, ought to be comprehended within the fewest words possible: as it cannot be relished but in the hurry and swelling of the mind, a leisurely view dissolves the charm, and discovers the description to be extravagant at least, and perhaps also ridiculous. This fault is palpable in a sonnet which passeth for one of the most complete in the French language: Phillis, in a long and florid description, is made as far to outshine the sun as he outshines the stars:

*Le silence regnoit sur la terre et sur l'onde,
L'air devenoit ferrain et l'Olimp vermeil,
Et l'amoureux Zephir affranchi du soleil,
Resussitoit les fleurs d'une haleine seconde.*

*L'Aurore deployoit l'or de sa tresse blonde;
Et semoit de rubis le chemin du soleil;
Enfin ce Dieu venoit au plus grand appareil
Qu'il soit jamais venu pour eclairer le monde :*

*Quand la jeune Phillis au visage riant,
Sortant de son palais plus clair que l'orient,
Fit voir une lumiere et plus vive et plus belle.*

*Sacre Flambeau du jour, n'en soiez point jaloux,
Vous parutes alors aussi peu devant elle,
Que les feux de la nuit avoient fait devant vous.*
Malleville.

There is in Chaucer a thought expressed in a single line, which sets a young beauty in a more advantageous light than the whole of this much laboured poem :

Up rose the sun, and up rose Emelie,

HYPERBOREAN, in the *Ancient Geography*. The ancients denominated those people and places *Hyperborean* which were to the northward of the Scythians. They had but very little acquaintance with these Hyperborean regions; and all they tell us of them is very precarious, much of it false. Diodorus Siculus says, the Hyperboreans were thus called by reason they dwelt beyond the wind Boreas; *ὑπερ* signifying, "above, or beyond," and *βορρως*, *Boreas*, the "north wind." This etymology is very natural and plausible; notwithstanding all that Rudbeck has said against it, who would have the word to be Gothic, and to signify *nobility*. Herodotus doubts whether or not there were any such nations as the Hyperborean. Strabo, who professes that he believes there are, does not take *hyperborean* to signify *beyond Boreas* or the north, as Herodotus understood it: the preposition *ὑπερ*, in this case, he supposes only to help to form a superlative; so that *hyperborean*, on his principles, means no more than *most northern*; by which it appears the ancients scarce knew themselves what the name meant.—Most of our modern geographers, as Hoffman, Cellarius, &c. have placed the Hyperboreans in the northern parts of the European continent, among the Siberians and Samoieds: according to them, the Hyperboreans of the ancients were those in general who lived farthest to the north. The Hyperboreans of our days are those Russians who inhabit between the Volga and the White sea. According to Clevier, the name *Celtes* was synonymous with that of Hyperboreans.

HYPERCATALECTIC, in the Greek and Latin poetry, is applied to a verse that has one or two syllables too much, or beyond the regular and just measure; as,

Muse sorores sunt Minervæ :

Also,

Muse sorores Palladis lugent.

HYPERCRITIC, an over-rigid censor or critic: one who will let nothing pass, but animadverts severely on the slightest fault. See **CRITICISM**. The word is compounded of *ὑπερ* *super*, "over, above, beyond;" and *κριτικός*, of *κρίσις* *judex*, of *κρίνω*, *judico*, "I judge."

HYPERDŪLIA,

Hyperbo-
rean
||
Hypercri-
tic.

Hyperdulia
||
Hypobole.

Hyperca-
thausis
||
Hypoga-
strium.

HYPERDULIA, in the Romish theology, is the worship rendered to the holy virgin. The word is Greek, *ὑπερδουλία*, composed of *ὑπερ*, above, and *δουλία*, worship, service. The worship offered to saints is called *dulia*; and that to the mother of God, *hyperdulia*, as being superior to the former.

HYPERIA, in *Ancient Geography*, the seat of the Phæacians near the Cyclops, (Homer): some commentators take it to be Camarina in Sicily; but, according to others, it is supposed to be an adjoining island, which they take to be Melita, lying in sight of Sicily. And this seems to be confirmed by Apollonius Rhodius. Whence the Phæacians afterwards removed to Corcyra, called *Scheria*, *Phæacia*, and *Mucris*; having been expelled by the Phœnicians, who settled in Melita for commerce, and for commodious harbours, before the war of Troy, (Diodorus Siculus.)

HYPERICUM, St JOHN'S WORT, a genus of plants belonging to the polyadelphia class, and in the natural method ranking under the 20th order, *Rotaceæ*. See *BOTANY Index*.

HYPERIDES, an orator of Greece, was the disciple of Plato and Isocrates, and governed the republic of Athens. He defended with great zeal and courage the liberties of Greece; but was put to death by Antipater's order, 322 B. C. He composed many orations, of which only one now remains. He was one of the ten celebrated Greek orators.

HYPERMNESTRA, in fabulous history, one of the fifty daughters of Danaus king of Argos. She alone refused to obey the cruel order Danaus had given to all his daughters, to murder their husbands the first night of their marriage; and therefore saved the life of Lynceus, after she had made him promise not to violate her virginity. Danaus, enraged at her disobedience, confined her closely in prison, whence Lynceus delivered her some time after.

HYPERSARCOSIS, in *Medicine* and *Surgery*, an excess of flesh, or rather a fleshy excrescence, such as those generally rising upon the lips of wounds, &c.

HYPHEN, an accent or character in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -; as *pre-established*, *five-leaved*, &c. Hyphens also serve to connect the syllables of such words as are divided by the end of the line.

HYPNOTIC, in the *Materia Medica*, such medicines as any way produce sleep, whether called *narcotics*, *hypnotics*, *opiates*, or *soporifics*.

HYPNOTICUS SERPENS, the *Sleep-snake*, in *Zoology*, the name of an East Indian species of serpent, called by the Ceylonese *nintipoloug*, a word importing the same sense. It is of a deep blackish brown, variegated with spots of white, and is a very fatal kind in its poison: its bite it is said brings on a sleep which ends in death; hence this trivial name.

HYPNUM, FEATHER-MOSS, a genus of plants of the natural order of musci, belonging to the cryptogamia class. See *BOTANY Index*.

HYPO, a Greek particle, retained in the composition of divers words borrowed from that language; literally denoting *under*, *beneath*.—In which sense it stands opposed to *ὑπερ supra*, "above."

HYPOBOLE, or **SUBJECTION**, (from *ὑπο*, and *βαλλω*, *I cast*), in rhetoric, a figure; so called, when

several things are mentioned, that seem to make for the contrary side, and each of them refuted in order. This figure, when complete, consists of three parts; a proposition, an enumeration of particulars with their answer, and a conclusion. Thus Cicero, upon his return from banishment, vindicates his conduct in withdrawing so quietly, and not opposing the faction that ejected him. See *ORATORY*, N^o 81.

HYPOCATHARSIS (compounded of *ὑπο under*, and *καθαίρω I purge*), in *Medicine*, a too faint or feeble purgation.

HYPOCAUSTUM, among the Greeks and Romans, a subterraneous place, where was a furnace to heat the baths. The word is Greek, formed of the preposition *ὑπο under*; and the verb *καίω*, to burn.—Another sort of hypocaustum was a kind of kiln to heat their winter parlours. The remains of a Roman hypocaustum, or sweating-room, were discovered under ground at Lincoln in 1739. We have an account of these remains in the *Philosophical Transactions*, N^o 461. § 29.—Among the moderns, the hypocaustum is that place where the fire is kept which warms a stove or hot-house.

HYPOCHÆRIS, HAWK'S-EYE, a genus of plants belonging to the syngenesia class, and in the natural method ranking under the 49th order, *Compositæ*. See *BOTANY Index*.

HYPOCHONDRIA, in *Anatomy*, a space on each side the epigastric region, or upper part of the abdomen. See *ANATOMY*, N^o 88.

HYPOCHONDRIAC PASSION, a disease in men, similar to the hysterical affection in women. See *MEDICINE Index*.

HYPOCISTIS, in the *Materia Medica*, an inspissated juice obtained from the sessile asarum, much resembling the true Egyptian acacia. They gather the fruit while unripe, and express the juice, which they evaporate over a very gentle fire, to the consistence of an extract, and then form into cakes, and expose them to the sun to dry. It is an astringent of considerable power; is good against diarrhœas and hæmorrhages of all kinds; and may be used in repellent gargarisms in the manner of the true acacia; but it is very rarely met with genuine in our shops, the German acacia being usually sold under its name.

HYPOCRISY, *ὑποκρίσις*, in *Ethics*, denotes dissimulation with regard to the moral or religious character. In other words, it signifies one who feigns to be what he is not; and is generally applied to those who assume the appearances of virtue or religion, without having any thing in reality of either.

HYPOGÆUM, *ὑπογαίον*, formed of *ὑπο under*, and *γαίαι earth*, in the ancient architecture, is a name common to all the parts of a building that are under ground; as the cellar, butteries, and the like places. The term *hypogæum* was used by the Greeks and Romans for subterraneous tombs in which they buried their dead.

HYPOGÆUM, *ὑπογαίον*, in *Astrology*, is a name given to the celestial houses which are below the horizon: and especially the *imum cæli*, or bottom of heaven.

HYPOGASTRIC, an appellation given to the internal branch of the iliac artery.

HYPOGASTRIUM, in *Anatomy*, the middle part of

Hypoglossi of the lower region of the belly. See ANATOMY, N° 88.

Hypoglossis. **HYPOGLOSSI EXTERNI, or MAJORES,** in Anatomy, the ninth pair of nerves, called also *linguales* and *glossatorii*. See ANATOMY.

HYPOGLOTTIS or HYPOGLOSSIS, (composed of *υπο* under, and *γλωττια* tongue), in Anatomy, is a name given to two glands of the tongue. There are four large glands of the tongue; two of them called *hypoglotitides*, situated under it, near the *venæ ranulares*: one on each side of the tongue. They serve to secrete a kind of serous matter of the nature of saliva, which is discharged into the mouth by little ducts near the gums.

HYPOGLOTTIS, or *Hypoglossis*, in Medicine, denotes an inflammation or ulceration under the tongue; called also *ranula*.

HYPOPYON, in Medicine, a collection of purulent matter under the corner of the eye.

HYPOSCENIUM, in antiquity, a partition under the pulpit or logeum of the Greek theatre, appointed for the music.

HYPOSTASIS, a Greek term, literally signifying *substance*, or *subsistence*; used in theology for *person*.—The word is Greek, *υποστασις*; compounded of *υπο* sub, “under:” and *ιστημι, στω, existo*; “I stand, I exist;” q. d. *sub sistencia*. Thus we hold, that there is but one nature or essence in God, but three *hypostases* or persons.

The term *hypostasis* is of a very ancient standing in the church. St Cyril repeats it several times, as also the phrase *union according to hypostasis*. The first time it occurs is in a letter from that father to Nestorius, where he uses it instead of *προσωπον*, the word we commonly render *person*, which did not seem expressive enough. “The philosophers (says St Cyril) have allowed three *hypostases*: They have extended the Divinity to three *hypostases*: They have even sometimes used the word *trinity*: And nothing was wanting but to have admitted the consubstantiality of the three *hypostases*, to show the unity of the divine nature, exclusive of all triplicity in respect of distinction of nature, and not to hold it necessary to conceive any respective inferiority of *hypostases*.”

This term occasioned great dissensions in the ancient church; first among the Greeks, and afterwards also among the Latins. In the council of Nice, *hypostasis* was defined to denote the same with *essence* or *substance*; so that it was heresy to say that Jesus Christ was of a different *hypostasis* from the Father; but custom altered its meaning. In the necessity they were under of expressing themselves strongly against the Sabellians, the Greeks made choice of the word *hypostasis*, and the Latins of *persona*; which change proved the occasion of endless disagreement. The phrase *τρεῖς υποστασεις*, used by the Greeks, scandalized the Latins, whose usual way of rendering *υποστασις* in their language was by *substantia*. The barrenness of the Latin tongue in theological phrases, allowed them but one word for the two Greek ones, *essentia* and *υποστασις*; and thus disabled them from distinguishing *essence* from *hypostasis*. For which reason they chose rather to use the term *tres personæ*, and *tres hypostases*.—An end was put to logomachias, in a synod held at Alexandria about the

year 362, at which St Athanasius assisted; from which time the Latins made no great scruple of saying *tres hypostases*, nor the Greeks of *tres personæ*.

HYPOTHECA, in the *Civil Law*, an obligation, whereby the effects of a debtor are made over to his creditor, to secure his debt. The word comes from the Greek *υποθηκα*, a thing subject to some obligation; of the verb *υποθηκωμι*, *suppose*, “I am rejected;” of *υπο* under, and *τιθημι πονο*, “I put.”

As the hypotheca is an engagement procured on purpose for the security of the creditor, various means have been made use of to secure to him the benefit of the convention. The use of the pawn or pledge is the most ancient, which is almost the same thing with the hypotheca; all the difference consisting in this, that the pledge is put into the creditor’s hands; whereas, in a simple hypotheca, the thing remained in the possession of the debtor. It was found more easy and commodious to engage an estate by a civil covenant than by an actual delivery: accordingly the expedient was first practised among the Romans; and from them the Romans borrowed both the name and the thing: only the Greeks, the better to prevent frauds, used to fix some visible mark on the thing, that the public might know it was hypothecate or mortgaged by the proprietor; but the Romans, looking on such advertisements as injurious to the debtor, forbade the use of them.

The Roman lawyers distinguished four kinds of hypothecas: the conventional, which was with the will and consent of both parties; the legal, which was appointed by law, and for that reason called *tacit*; the prator’s pledge, when by the flight or non-appearing of the debtor, the creditor was put in possession of his effects; and the judiciary, when the creditor was put in possession by virtue of a sentence of the court.

The conventional hypotheca is subdivided into general and special. The hypotheca is general, when all the debtor’s effects, both present and future, are engaged to the creditor. It is special, when limited to one or more particular things.

For the tacit hypotheca, the civilians reckon no less than twenty-six different species thereof.

HYPOTHENUSE, in *Geometry*, the longest side of a right-angled triangle, or that which subtends the right angle.

HYPOTHESIS, (formed of *υπο* “under,” and *θεσις* *positio*, of *τιθημι πονο*, “I put”), is a proposition or principle which we suppose, or take for granted, in order to draw conclusions for the proof of a point in question.

In disputation, they frequently make false hypotheses, in order to draw their antagonists into absurdities; and even in geometry truths are often deducible from such false hypotheses.

Every conditional or hypothetical proposition may be distinguished into hypothesis and thesis: the first rehearses the conditions under which any thing is affirmed or denied; and the latter is the thing itself affirmed or denied. Thus, in the proposition, a triangle is half of a parallelogram, if the bases and altitudes of the two be equal; the latter part is the hypothesis, “if the bases,” &c. and the former a thesis, “a triangle is half a parallelogram.”

In strict logic, we are never to pass from the hypothesis

Hypothesis ||
Hypotrachilon.
thesis to the thesis; that is, the principle supposed must be proved to be true, before we require the consequence to be allowed.

HYPOTHESIS, in *Physics*, &c. denotes a kind of system laid down from our own imagination, whereby to account for some phenomenon or appearance of nature. Thus we have hypotheses to account for the tides, for gravity, for magnetism, for the deluge, &c.

The real and scientific causes of natural things generally lie very deep: observation and experiment, the proper means of arriving at them, are in most cases extremely slow, and the human mind is very impatient: hence we are frequently driven to feign or invent something that may seem like the cause, and which is calculated to answer the several phenomena, so that it may possibly be the true cause.

Philosophers are divided as to the use of such fictions or hypotheses, which are much less current now than they were formerly. The latest and best writers are for excluding hypotheses, and standing wholly on observation and experiment. Whatever is not deduced from phenomena, says Sir Isaac Newton, is an hypothesis; and hypotheses, whether metaphysical, or physical, or mechanical, or of occult qualities, have no place in experimental philosophy.

The Cartesians take upon them to suppose what affections in the primary particles of matter they please; just what figures, what magnitudes, what motions, and what situations, they find for their purpose. They also feign certain unseen, unknown fluids, and endue them with the most arbitrary properties; give them a subtilty which enables them to pervade the pores of all bodies, and make them agitated with the most unaccountable motions. But is not this to set aside the real constitution of things, and to substitute dreams in their place? Truth is scarce attainable even by the surest observations; and will fanciful conjectures ever come at it? They who found their speculations on hypotheses, even though they argue from them regularly, according to the strictest laws of mechanics, may be said to compose an elegant and artful fable; but it is still only a fable.

HYPOTHESES is more particularly applied in astronomy to the several systems of the heavens; or the different ways in which different astronomers have supposed the heavenly bodies to be ranged, moved, &c.

The principal hypotheses are the Ptolemaic, Copernican, and Tychnic. The Copernican is now become so current, and is so well warranted by observation, that the retainers thereto hold it injurious to call it an hypothesis. See **ASTRONOMY**.

HYPOTIPOSIS. See **ORATORY**, N° 91.

HYPOTRACHELION, in *Architecture*, is used for a little frieze in the Tuscan and Doric capital, between the astragal and annulets; called also the *colerin* and

gorgerin. The word is applied by some authors in a more general sense, to the neck of any column, or that part of its capital below the astragal. **Hypothesis** || **Hystrix**.

HYPOXIS, a genus of plants belonging to the hexandria class, and in the natural method ranking under the 10th order *Coronaria*. See **BOTANY Index**.

HYPSISTARIL, (formed from ὑψιστος "highest"), a sect of heretics in the fourth century: thus called from the profession they made of worshipping the most high God.

The doctrine of the Hypsistarians was an assemblage of Paganism, Judaism, and Christianity. They adored the most high God with the Christians; but they also revered fire and lamps with the heathens: and observed the sabbath, and the distinction of clean and unclean things with the Jews.

The Hypsistarii bore a near resemblance to the Eucrites, or Massilians.

HYRCANIA, in *Ancient Geography*, a country of the farther Asia, lying to the south-east of the *Mare Hyrcanum* or *Caspium*; with Media on the west, Parthia on the south, and Margiana on the east. Famous for its tygers (Virgil); for its vines, figs, and olives, (Strabo).

HYRCANIA, in *Ancient Geography*, a town of Lydia, in the *campus Hyrcanus*, near Thyatira; so called from colonists brought from Hyrcania, a country lying to the south of the Caspian sea. The people called *Hyrcani Macedones*, because a mixed people (Pliny).—Another Hyrcania, the metropolis of the country called *Hyrcania*. Thought to be the Tape of Strabo, the Syrius of Polybius, the Zeudracarta of Arrian, and the Asaac of Isidorus Characenus.—A third, a strong place of Judea, built by Hyrcanus.

HYSSOP. See **HYSSOPUS**.

Hedge-Hyssop. See **GRATIOLA**.

HYSSOPUS, **HYSSOP**, a genus of plants belonging to the didynamia class. See **BOTANY** and **MATERIA MEDICA Index**.

HYSTERIC AFFECTION, or *Passion*, (formed of ὑστερα "womb"); a disease in women, called also *suffocation of the womb*, and vulgarly *fits of the mother*. It is a spasmodico-convulsive affection of the nervous system, proceeding from the womb; for the symptoms and cure of which, see **MEDICINE**.

HYSTERON PROTERON, in *Grammar* and *Rhetoric*, a species of the hyperbaten, wherein the proper order of construction is so inverted, that the part of any sentence which should naturally come first is placed last: as in this of Terence, *Valet et vivit*, for *vivit et valet*; and in the following of Virgil, *Moriamur, & in media arma ruamus*, for *In media arma ruamus, & moriamur*.

HYSTRIX, or **PORCUPINE**, a genus of quadrupeds belonging to the order of glires. See **MAMMALIA Index**.

I.

I, or *i*, the ninth letter and third vowel of the alphabet, is pronounced by throwing the breath suddenly against the palate, as it comes out of the larynx, with a small hollowing of the tongue, and nearly the same opening of the lips as in pronouncing *a* or *e*. Its sound varies: in some words it is long, as *high*, *mind*, &c.; in others short, as *bid*, *hid*, *sin*, &c.; in others, again, it is pronounced like *y*, as in *collier*, *onion*, &c.; and in a few, it sounds like *ee*, as in *machine*, *magazine*, &c. No English word ends in *i*, *e* being either added to it, or else the *i* turned into *y*.

But besides the vowel, there is the *jod* consonant; which, because of its different pronunciation, has likewise a different form, thus *J*, *j*. In English, it has the soft sound of *g*; nor is used, but when *g* soft is required before vowels, where *g* is usually hard: thus we say, *jack*, *jet*, *join*, &c. instead of *gack*, *get*, *goin*, &c. which would be contrary to the genius of the English language.

I, used as a numeral, signifies *one*, and stands for so many units as it is repeated times; thus **I**, one; **II**, two; **III**, three. &c.; and when put before a higher numeral, it subtracts itself, as **IV**, four, **IX**, nine, &c. But, when set after it, so many are added to the higher numeral as there are **I**'s added: thus **VI** is 5 + 1, or six; **VII**, 5 + 2, or seven; **VIII**, 5 + 3, or eight. The ancient Romans likewise used **IO** for 500, **CIO** for 1000, **IDIO** for 5000, **CCIDIO** for 10,000. Farther than this, as Pliny observes, they did not go in their notation; but, when necessary repeated the last number, as **CCCCIDIO**, **CCCCIDIO**, for 200,000; **CCCCIDIO**, **CCCCIDIO**, for 300,000; and so on.

The ancients sometimes changed *i* into *u*; *decimus* for *decimus*; *maximus* for *maximus*, &c.

According to Plato, the vowel *i* is proper to express delicate but humble things, as in this verse in Virgil which abounds in *i*'s, and is generally admired:

Accipiant inimicum imbrem, rimisque fatiscunt.

I, used as an abbreviation, is often substituted for the whole word **JESUS**, of which it is the first letter.

JABBOK, a brook on the other side of the Jordan, the spring whereof is in the mountains of Gilead. It falls into Jordan pretty near the sea of Tiberias, to the south of this sea. Near this brook the patriarch Jacob wrestled with the angel (Gen. xxxii. 22). The Jabbok separated the land of the Ammonites from the Gaulanites, and the territories of Og king of Bashan.

JABESH, or *JABESH-gilead*, was the name of a city, in the half tribe of Manasseh, beyond Jordan. The scripture calls it generally Jabesh-Gilead, because it lay in Gilead, at the foot of the mountains which go by this name. Eusebius places it six miles from Pella, towards Gerasa; and consequently it must be eastward of the sea of Tiberias.

JABIRU. See **MYCTERIA**, **ORNITHOLOGY Index**.

JABLONSKI, DANIEL ERNEST, a learned Polish Protestant divine, born at Dantzick in 1660. He became successively minister of Magdeburg, Lissa, Koenigsberg, and Berlin; and was at length ecclesiastical

counsellor, and president of the academy of sciences at the latter. He took great pains to effect an union between the Lutherans and Calvinists; and wrote some works which are in good esteem, particularly Meditations on the origin of the Scriptures, &c. He died in 1741.

JABLONSKI, *Theodore*, counsellor of the court of Prussia, and secretary of the royal academy of sciences in Berlin, was also a man of distinguished merit. He loved the sciences, and did them honour, without that ambition which is generally seen in men of learning; it was owing to this modesty that the greatest part of his works were published without his name. He published, in 1711, a French and German Dictionary; a Course of Morality, in 1713; a Dictionary of Arts and Sciences, 1721; and translated *Tacitus de moribus Germanorum* into High Dutch, in 1724.

JABNE, in *Ancient Geography*, a town of Palestine, near Joppa; called *Jamnia* or *Jamial*, by the Greeks and Romans. In Joshua xv. it seems to be called *Jabneel*; but in 2 Chron. xxvi. *Jabne*. It was taken from the Philistines by Uzziah, who demolished its fortifications. Its port, called *Jamitarum portus*, lay between Joppa and Azotus.

JACAMAR. See **ALCEDO**, **ORNITHOLOGY Index**.

JACCA, an ancient town of Spain, in the kingdom of Arragon, with a bishop's see, and a fort; seated on a river of the same name among the mountains of Jacca, which are part of the Pyrenees. W. Long. o. 19. N. Lat. 42. 36.

JACK, in mechanics, a well-known instrument of common use for raising great weights of any kind.

The common kitchen-jack is a compound engine, where the weight is the power applied to overcome the friction of the parts and the weight with which the spit is charged; and a steady and uniform motion is obtained by means of the fly.

JACK, in the sea-language, a sort of flag or colours, displayed from a mast erected on the outer end of a ship's bowsprit. In the British navy the jack is nothing more than a small union flag, composed of the intersection of the red and white crosses; but in merchant-ships this union is bordered with a red field. See the article **UNION**.

JACK is used also for a horse or wooden frame to saw timber upon; for an instrument to pull off a pair of boots; for a great leathern pitcher to carry drink in; for a small bowl that serves as a mark at the exercise of bowling; and for a young pike.

Jack-Flag, in a ship, that is hoisted up at the sprit-sail top-mast head.

Jack-Daw, the English name of a species of corvus. See **CORVUS**, **ORNITHOLOGY Index**.

This bird is very mischievous to the farmer and gardener; and is of such a thievish disposition, that he will carry away much more than he can make use of. There is a method of destroying them by a kind of springs much used in England; and is so useful, that it ought to be made universal.—A stake of about five feet long is to be driven firmly into the ground, and made so fast that it cannot move, and so sharp in

I
||
Jabesh.

Jabiru
||
Jack-Daw.

Jackall
||
Jacobites.

the point that the bird cannot settle upon it. Within a foot of the top there must be a bole bored through it, of three quarters of an inch diameter; through this hole is to be put a stick of about eight inches long; then a horse-hair springe or noose is to be made fast to a thin hazel-wand, and this brought up to the place where the short stick is placed, and carried with it through the hole, the remainder being left open under that stick. The other end of the hazel rod is to be put through a hole in the stake near the ground, and fastened there. The stake is to be planted among the jack-daw's food, and he will naturally be led to settle on it; but finding the point too sharp, he will descend to the little cross stick. This will sink with his weight, and the springe will receive his leg, and hold him fast.

JACKALL, in *Zoology*. See CANIS, MAMMALIA *Index*.

JACOB, the son of Isaac and Rebekah, was born in the year of the world 2168, before Jesus Christ 1836. The history of this patriarch is given at large in the book of Genesis. He died in Egypt in the 147th year of his age. Joseph directed that the body should be embalmed, after the manner of the Egyptians; and there was a general mourning for him throughout Egypt for seventy days. After his death, Joseph and his brethren, accompanied with the principal men of Egypt, carried him, with the king of Egypt's permission, to the burying-place of his fathers near Hebron, where his wife Leah had been interred. When they were come into the land of Canaan, they mourned for him again seven days; upon which occasion the place where they staid was called Abelmisraim, or the mourning of the Egyptians.

JACOB *Ben Hajim*, a rabbi famous for the collection of the Masorah in 1525; together with the text of the bible, the Chaldaic paraphrase, and Rabbinical commentaries.

JACOB, *Ben Naphtali*, a famous rabbi of the 5th century: he was one of the principal massorets, and bred at the school of Tiberias in Palestine with Ben Aser, another principal massoret. The invention of points in Hebrew to serve for vowels, and of accents to facilitate the reading of the language, are ascribed to these two rabbis; and said to be done in an assembly of the Jews held at Tiberias, A. D. 476.

JACOBINE MONKS, the same with DOMINICANS.

JACOBINES, the name assumed by a party or club at the beginning of the French revolution, composed of members of the national assembly. This club held its meetings in the hall belonging to the Jacobin friars, from which it derived its name. For an account of the views and influence of the Jacobin club in the French revolution, see FRANCE.

JACOBITES, a term of reproach bestowed on the persons who, vindicating the doctrines of passive obedience and non-resistance with respect to the arbitrary proceedings of princes, disavow the revolution in 1688, and assert the supposed rights, and adhere to the interests, of the late abdicated King James and his family.

JACOBITES, in church history, a sect of Christians in Syria and Mesopotamia; so called, either from Jacob a Syrian who lived in the reign of the emperor Mauritius, or from one Jacob a monk who flourished in the year 550.

Jacobus
||
Jagger-
naut.

The Jacobites are of two sects, some following the rites of the Latin church, and others continuing separated from the church of Rome. There is also a division among the latter, who have two rival patriarchs. As to their belief, they hold but one nature in Jesus Christ; with respect to purgatory and prayers for the dead, they are of the same opinion with the Greeks and other eastern Christians: they consecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institution.

JACOBUS, a gold coin, worth 25 shillings; so called from King James I. of England, in whose reign it was struck. See COIN.

We usually distinguish two kinds of *Jacobus*, the *old* and the *new*; the former valued at 25 shillings, weighing six penny-weights ten grains; the latter, called also *Carolus*, valued at 23 shillings, in weight five penny-weights twenty grains.

JACQUINIA, a genus of plants belonging to the hexandria class, and in the natural method ranking with those of which the order is doubtful. See BOTANY *Index*.

JACULATOR, or SHOOTING-FISH. See CHÆTODON, ICHTHOLOGY *Index*.

JADDESSES is the name of an inferior order of priests in Ceylon, who have the care of the chapels appropriated to the genii, who form a third order of gods among these idolaters. These priests are applied to by the people in a time of disease or calamity, who offer a cock on their behalf to appease the anger of the demons.

JADE-STONE, or LAPIS NEPHRITICUS, a species of MINERAL. See MINERALOGY *Index*.

JAFFA, an ancient town of Asia in Palestine, formerly called *Joppa*. Its former grandeur is now greatly diminished. It is situated 50 miles north-west of Jerusalem, while others make it only 27, and 100 from the town of Acre. It was taken by the French under Bonaparte, in February 1799, but afterwards retaken and fortified. E. Long. 35.0. N. Lat. 32. 16.

JAFFATEEN ISLANDS, the name of four islands in the Red sea, visited by Mr Bruce in his late travels. They are joined together by shoals or sunk rocks; are crooked or bent like half a bow; and are dangerous for ships in the night-time, because there seems to be a passage between them, to which, while the pilots are paying attention, they neglect two small sunk rocks which lie almost in the middle of the entrance in deep water.

JAFNAPATAN, a sea-port town, seated at the north-east end of the island of Ceylon in the East Indies. The Dutch took it from the Portuguese in 1658, and have continued in the possession of it since that time. They export from thence great quantities of tobacco, and some elephants, which are accounted the most docile of any in the whole world. E. Long. 80. 25. N. Lat. 9. 30.

JAGENDORF, a town and castle of Silesia, capital of a province of the same name, seated on the river Oppa. E. Long. 17. 47. N. Lat. 50. 4.

JAGGERNAUF, a black pyramidal stone worshipped by the Gentoos, who pretend that it fell from heaven, or was miraculously presented on the place where their temple stands. There are many other idols of this figure in India; which, however, are all but

Jaggernaut but accounted copies from the Jaggernaut. According to the best information Mr Grose could obtain, this stone is meant to represent the power presiding over universal generation, which they attribute to the genial heat and influence of the sun acting in subordination to it. Domestic idols of the form of the Jaggernaut, and distinguished by the same name, are made by the Gentoos. These are niched up in a kind of triumphal car, decorated with gilding and tinsel; which for some days they keep in the best apartment in their house. During this time their devotion consists in exhibiting the most obscene postures, and acting all manner of lasciviousness, in sight as it were of the idol, and as the most acceptable mode of worship to that deity it represents; after which they carry it in its gilded car in procession to the Ganges, and throw in all together as an acknowledgment to that river of its congenial fertilization with that of the sun. Formerly this machine was decorated with jewels and other expensive ornaments; but the Indians are now become less extravagant, as they found that the Moors and Christians, watching the places where they threw in their idols, dived for them for the sake of the jewels with which they were adorned.

Our author conjectures, that this pyramidal form of the Gentoos idol was originally taken from that of flame, which always inclines to point upwards. From this Indian deity he supposes the shape of the Paphian Venus to have been derived, for which Tacitus could not account. This image had nothing of the human form in it, but rose orbicularly from a broad basis, and in the nature of a race goal tapering to a narrow convex a-top; which is exactly the figure of the idol in India, consecrated to such an office as that heathen deity was supposed to preside over, and to which, on the borders of the Ganges especially, the Gentoos virgins are brought to undergo a kind of superficial desecration before they are presented to their husbands.

JAGHIRE, an assignment made in Bengal by an imperial grant upon the revenue of any district, to defray civil or military charges, pensions, gratuities, &c.

JAGHIREDER, the holder of a jaghire.

JAGO, RICHARD, an ingenious poet, was vicar of Snitterfield in Warwickshire, and rector of Kimcote in Leicestershire. He was the intimate friend and correspondent of Mr Shentstone, contemporary with him at Oxford, and, it is believed, his schoolfellow; was of University college; took the degree of M. A. July 9. 1739; was author of several poems in the 4th and 5th volumes of Doddsley's Poems; published a sermon, in 1755, on the Causes of Impenitence considered, preached May 4. 1755, at Harbury in Warwickshire, where he was vicar, on occasion of a conversation said to have passed between one of the inhabitants and an apparition in the church-yard there; wrote "Edge-hill," a poem, for which he obtained a large subscription in 1767; and was also author of "Labour and Genius," 1768, 4to; of "The Blackbirds," a beautiful elegy in the Adventurer; and of many other ingenious performances. He died May 28. 1781.

St JAGO, a large river of South America, which rises in the audience of Quito in Peru. It is navigable; and falls into the South sea, after having watered a fertile country abounding in cotton-trees, and inhabited by wild Americans.

St JAGO, the largest, most populous, and fertile of the Cape Verd islands, on the coast of Africa, and the residence of the Portuguese viceroy. It lies about 13 miles eastward from the island of Mayo, and abounds with high barren mountains; but the air, in the rainy season, is very unwholesome to strangers. Its produce is sugar, cotton, wine, and some excellent fruits. The animals are black cattle, horses, asses, deer, goats, hogs, civet-cats, and some very pretty green monkeys with black faces.

Sir George Staunton, in the account which he gives of this island, observes, that it is liable to long and excessive droughts, for which it is perhaps impossible to assign any philosophical cause. It was in a state of absolute famine at the end of 1792, when visited by the embassy to China, and the waters of the rivers were almost dried up. The surface of the earth was devoid of herbage, the cattle had nearly all perished, as much from the want of food as from drought.

"What were the uncommon circumstances (says Sir George) that took place in the atmosphere of that part of Africa to which the Cape de Verd islands lie contiguous, or in the vast expanse of continent extending to the east behind it, and from which this direful effect must have proceeded (as they happened where no man of science existed to observe or to record them), will remain unknown, nor is theory bold enough to supply the place of observation. Whatever was the cause which thus arrested the bountiful hand of nature, by drawing away the sources of fertility, it was observable, that some few trees and plants preserved their luxuriance, indicating that they still could extract from the arid earth whatever portion of humidity it was necessary to derive from thence for the purpose of vegetable life, though it was denied to others."

Beside palm trees, frequently found verdant amidst burning sands, nothing could be more rich in flavour, or abound more with milky though corrosive juice, than the *asclepias gigantea*, growing plentifully without culture, but undisturbed. The physic nut tree appeared as if its perpetuity was not to be affected by any drought. Some species of *mimosa*, or sensitive plant, were most common, and did not appear to languish.

But the annual produce of agriculture had almost wholly disappeared, and the sugar canes had little resemblance to any thing like vegetation. Yet vegetation quickly revived whenever any moisture could be conveyed through the soil.

The residence of the viceroy is represented by Sir George as a hamlet, consisting of 100 small dwellings, only one story high, scattered nearly a mile in length, and one-third as much in breadth. Not being commanded by any eminence, it was a situation which admitted of defence, yet the fort was nearly in ruins, and the few guns mounted on it were mostly honey-combed. Amidst the ruins of St Jago, was found a Portuguese, to whom one of the party was recommended, by whom they were hospitably received, and treated with every species of tropical fruits from his garden.

St JAGO, a handsome and considerable town of South America, the capital of Chili, with a good harbour, a bishop's see, and a royal audience. It is seated in a large and beautiful plain, abounding with all the necessaries of life, at the foot of the Cordilleras, on the river Mapocho, which runs across it from east to west.

Here

Jago
||
Jalemus.

Here are several canals and a dyke, by means of which they water the gardens and cool the streets.—It is very much subject to earthquakes. W. Long. 69. 35. S. Lat. 33. 40.

St Jago de Cuba, a town in North America, situated on the southern coast of the island of Cuba, in the bottom of a bay, with a good harbour, and on a river of the same name. W. Long. 76. 44. N. Lat. 20. 0.

Jago de los Cavallos, a town of America, and one of the principal of the island of Hispaniola. It is seated on the river Yague, in a fertile soil, but bad air. W. Long. 70. 5. N. Lat. 19. 40.

St Jago delintero, a town of South America, one of the most considerable of Tucuman, and the usual residence of the inquisitor of the province. It is seated on a large river, in a flat country, where there is game, tygers, guanacos, commonly called *camel-sheep*, &c.

Jago de la Vega, otherwise called *Spanish-town*, is the capital of the island of Jamaica, in the West Indies; and stands in 18° 1' north latitude, and 76° 45' west longitude. It is about a mile in length, and little more than a quarter of a mile in breadth, and contains between 500 and 600 houses, with about 4000 inhabitants of all colours and denominations. This town is situated in a delightful plain on the banks of the Rio Cobre, 13 miles from Kingston, and 10 from Port Royal. It is the residence of the commander in chief: and here the supreme court of judicature is held, four times in the year, viz. on the last Tuesdays of February, May, August, and November, and sits three weeks.—*St Jago de la Vega* is the county-town of Middlesex, and belongs to the parish of St Catharine; in which parish there are 11 sugar-plantations, 108 pens, and other settlements, and about 10,000 slaves.

JAGUAR, or **JAQUAR**, a name given to the Brazilian ounce, a species of **FELIS**. See **FELIS**, **MAMMALIA Index**.

JAGUEER, in East India affairs, any pension from the Grand Mogul, or king of Delhi; generally such as are assigned for military services.

JAGUEERDAR, the holder or possessor of a jagueer. It comes from three Persian words, *ja*, "a place;" *guerisun*, "to take;" and *dashun*, "to hold;" *guesi*, "a place-holder or pensioner." In the times of the Mogul empire, all the great officers of the court, called *onrahs*, were allowed jagueers, either in lands of which they collected the revenues, or assignments upon the revenues for specified sums, payable by the lord-lieutenant of a province: which sums were for their maintenance, and the support of such troops as they were necessitated to bring into the field when demanded by the emperor, as the condition of their jagueers, which were always revokable at pleasure.

JAIL-FEVER, a very dangerous distemper of the contagious kind, arising from the putrescent disposition of the blood and juices. See **MEDICINE Index**.

JALAP, the root of a species of convolvulus or bind weed. See **CONVOLVULUS**, **BOTANY** and **MATERIA MEDICA Index**.

JALEMUS, in antiquity, a kind of mournful song, used upon occasion of death, or any other affecting accident. Hence the Greek proverbs had their original, *αἰνεῖν νεκρῶν, or ἰνεῖν νεκρῶν*, i. e. *more sad or colder*

than a *jalemus*, εἰς τὰς ἀκμῆς ἐλθεῖν, worthy to be ranked among *jalemus*.

Jaloffs
||
Jamaica.

JALOFFS, or **YALOFFS**, are a warlike people, inhabiting most of that part of Africa, lying between Senegal and the Mandingo states on the Gambia. Their lips, according to Mr Park, are not so protuberant as those of the generality of Africans; and though their skin is of the deepest black, they are esteemed by the white traders as the most fightly of the negroes in that part of the continent. They are divided into several independent states, and more resemble the Mandingoes than any other nation in their manners and government, but much exceed them in the manufacture of cotton cloth, spinning the wool to a finer thread, weaving it in a broader loom, and dyeing it of a better colour. They make excellent soap, by boiling ground nuts in water, and then adding a ley of wood ashes. They likewise manufacture very good iron, which they carry to Bandoc to exchange for salt. Their language, it is said, is copious and significant, and is frequently learned by Europeans trading to Senegal.

A generous disposition, according to the testimony of Mr Park, is said to distinguish them above the generality of savages; they know how to return an act of kindness shewn them by others in distress, and their conduct towards their enemies; in many instances, is said to be worthy of imitation.

JAMADAR, an officer of horse or foot, in Hindostan. Also the head or superintendant of the Peons in the Sewaury or train of any great man.

JAMAICA, an island of the West Indies, the largest of the Antilles, lying between 17° and 19° N. Lat. and between 76° and 79° W. Long.; in length near 170 miles, and about 60 in breadth. It approaches in its figure to an oval. The windward passage right before it hath the island of Cuba on the west, and Hispaniola on the east, and is about 20 leagues in breadth.

This island was discovered by Admiral Christopher Columbus in his second voyage, who landed upon it May 5. 1494; and was so much charmed with it, as always to prefer it to the rest of the islands: in consequence of which, his son chose it for his dukedom. It was settled by Juan d'Esquivel, A. D. 1509, who built the town, which, from the place of his birth, he called *Seville*, and 11 leagues farther to the east stood *Mehilla*. Oriston was on the south side of the island, seated on what is now called *Blue Fields River*. All these are gone to decay; but *St Jago*, now *Spanish-town*, is still the capital. The Spaniards held this country 160 years, and in their time the principal commodity was cacao; they had an immense stock of horses, asses, and mules, and prodigious quantities of cattle. The English landed here under Penn and Venables, May 11. 1654, and quickly reduced the island. Cacao was also their principal commodity till the old trees decayed, and the new ones did not thrive; and then the planters from Barbadoes introduced sugar-canes, which hath been the great staple ever since.

The prospect of this island from the sea, by reason of its constant verdure, and many fair and safe bays, is wonderfully pleasant. The coast, and for some miles within, the land is low; but removing farther, it rises and becomes hilly. The whole isle is divided by a ridge of mountains running east and west, some rising

Jamaica. to a great height : and these are composed of rock and a very hard clay ; through which, however, the rains that fall incessantly upon them have worn long and deep cavities, which they call *gullies*. These mountains, however, are far from being unpleasent, as they are crowned even to their summits with a variety of fine trees. There are also about a hundred rivers that issue from them on both sides : and, though none of them are navigable for any thing but canoes, are both pleasing and profitable in many other respects. The climate, like that of all countries between the tropics, is very warm towards the sea, and in marily places unhealthy ; but in more elevated situations, cooler ; and, where people live temperately, to the full as wholesome as in any part of the West Indies. The rains fall heavy for about a fortnight in the months of May and October ; and, as they are the cause of fertility, are styled seasons. Thunder is pretty frequent, and sometimes showers of hail : but ice and snow are never seen, although on the tops of the mountains, and at no very great height, the air is exceedingly cold.

The most eastern parts of this ridge are known under the name of the *Blue Mountains*. This great chain of rugged rocks defends the south side of the island from those boisterous north-west winds, which might be fatal to their produce. Their streams, though small, supply the inhabitants with good water, which is a great blessing, as their wells are generally brackish. The Spaniards were persuaded that these hills abounded with metals : but we do not find that they wrought any mines ; or if they did, it was only copper, of which they said the bells in the church of St Jago were made. They have several hot springs, which have done great cures. The climate was certainly more temperate before the great earthquake ; and the island was supposed to be out of the reach of hurricanes, which since that time it hath severely felt. The heat, however, is very much tempered by land and sea breezes ; and it is asserted, that the hottest time of the day is about eight in the morning. In the night, the wind blows from the land on all sides, so that no ships can then enter their ports.

In an island so large as this, which contains above five millions of acres, it may be very reasonably conceived that there are great variety of soils. Some of these are deep, black, and rich, and mixed with a kind of potters earth ; others shallow and sandy ; and some of a middle nature. There are many savannahs, or wide plains, without stones, in which the native Indians had luxuriant crops of maize, which the Spaniards turned into meadows, and kept in them prodigious herds of cattle. Some of these savannahs are to be met with even amongst the mountains. All these different soils may be justly pronounced fertile, as they would certainly be found, if tolerably cultivated, and applied to proper purposes. A sufficient proof of this will arise from a very cursory review of the natural and artificial produce of this spacious country.

It abounds in maize, pulse, vegetables of all kinds, meadows of fine grass, a variety of beautiful flowers, and as great a variety of oranges, lemons, citrons, and other rich fruits. Useful animals there are of all sorts, horses, asses, mules, black cattle of a large size, and sheep, the flesh of which is well tasted, though their

Jamaica. wool is hairy and bad. Here are also goats and hogs in great plenty ; sea and river fish ; wild, tame, and water-fowl. Amongst other commodities of great value, they have the sugar-cane, cacao, indigo, pimento, cotton, ginger, and coffee ; trees for timber and other uses, such as mahogany, manchineel, white wood which no worm will touch, cedar, olives, and many more. Besides these, they have fustick, red wood, and various other materials for dyeing. To these we may add a multitude of valuable drugs, such as guaiacum, china, sarsaparilla, cassia, tamarinds, vanillas, and the prickle-pear or opuntia, which produces the cochineal ; with no inconsiderable number of odoriferous gums. Near the coast they have salt-ponds, from which at one time they supplied their own consumption, and might certainly make any quantity they pleased.

As this island abounds with rich commodities, it is happy likewise in having a number of fine and safe ports. Point Morant, the eastern extremity of the island, hath a fair and commodious bay. Passing on to the south, there is Port Royal : on a neck of land which forms one side of it, there stood once the fairest town in the island ; and the harbour is as fine as one can be wished, capable of holding a thousand large vessels, and still the station of our squadron. Old Harbour is also a convenient port, so is Maccary Bay ; and there are at least twelve more between this and the western extremity, which is Point Negrillo, where our ships of war lie when there is a war with Spain. On the north side there is Orange bay, Cold harbour, Rio Novo, Montego bay, Port Antonio, one of the finest in the island, and several others. The north-west winds, which sometimes blow furiously on this coast, render the country on that side less fit for canes, but pimento thrives wonderfully ; and certainly many other staples might be raised in small plantations, which are frequent in Barbadoes, and might be very advantageous here in many respects.

The town of Port Royal stood on a point of land running far out into the sea, narrow, sandy, and incapable of producing any thing. Yet the excellence of the port, the convenience of having ships of seven hundred tons coming close up to their wharfs, and other advantages, gradually attracted inhabitants in such a manner, that though many of their habitations were built on piles, there were near two thousand houses in the town in its most flourishing state, and which let at high rents. The earthquake by which it was overthrown happened on the 7th of June 1692, and numbers of people perished in it. This earthquake was followed by an epidemic disease, of which upwards of three thousand died : yet the place was rebuilt ; but the greatest part was reduced to ashes by a fire that happened on the 9th of January 1703, and then the inhabitants removed mostly to Kingston. It was, however, rebuilt for the third time ; and was rising towards its former grandeur, when it was overwhelmed by the sea, August 28. 1722. There is, notwithstanding, a small town there at this day. Hurricanes since that time have often happened, and occasioned terrible devastations.

The island is divided into three counties, Middlesex, Surry, and Cornwall ; containing 20 parishes, over each of which presides a magistrate styled a *custos* ; but these

Jamaica. these parishes in point of size are a kind of hundreds. The whole contain 56 towns and villages, 18 churches and chapels, and about 23,000 white inhabitants.

The administration of public affairs is by a governor and council of royal appointment, and the representatives of the people in the lower house of assembly. They meet at Spanish-town, and things are conducted with great order and dignity. The lieutenant-governor and commander in chief has 5000l. currency, or 3571l. 8s. 6½d. sterling besides which, he has a house in Spanish-town, a pen or a farm adjoining, and a polink or mountain for provisions: a secretary, an under-secretary, and a domestic chaplain.

The honourable the council consists of a president and 10 members; with a clerk, at 270l. a chaplain 100l. usher of the black rod and messenger 250l.

The honourable the assembly consists of 43 members, one of whom is chosen speaker. To this assembly belong a clerk, with 1000l. salary; a chaplain, 150l.; messenger, 700l.; deputy, 140l.; and printer, 200l.

The number of members returned by each parish and county are, for *Middlesex* 17, viz. St Catharine 3, St Dorothy 2, St John 2, St Thomas in the Vale 2, Clarendon 2, Vere 2, St Mary 2, St Ann 2: For *Surry* 16, viz. Kingston 3, Port Royal 3, St Andrew 2, St David 2, St Thomas in the East 2, Portland 2, St George 2: For *Cornwall* 10, viz. St Elizabeth 2, Westmoreland 2, Hanover 2, St James 2, Trelawney 2.

The high court of chancery consists of the chancellor (governor for the time being), 25 masters in ordinary, and 20 masters extraordinary; a register, and clerk of the patents; serjeant at arms, and mace-bearer. The court of vice admiralty has a sole judge, judge furrogate, and commissary, king's advocate, principal register, marshal, and a deputy-marshal. The court of ordinary, consists of the ordinary (governor for the time being), and a clerk. The supreme court of judicature has a chief justice, 120l. and 16 assistant judges; attorney-general, 400l.; clerk of the court, 100l. clerk of the crown, 350l.; solicitor for the crown: 33 commissioners for taking affidavits; a provost-marshal-general, and eight deputies; 18 barristers, besides the attorney-general and advocate-general; and upward of 120 practising attorneys at law.

The commerce of Jamaica is very considerable, not only with all parts of Great Britain and Ireland, but with Africa, North and South America, the West In-

dia islands, and the Spanish main. The ships annually employed are upwards of 500 sail.

The following account of the exports of this island in 1770, as given by Abbé Raynal, but which in several particulars appears to be under-rated, will contribute more than all that hath been said, to show the importance of Jamaica. They consisted in 2249 bales of cotton, which at 10 pounds per bale, the price in the island, amounts to 22,490l.; 1873 hundred weight of coffee, at three pounds five shillings per hundred, 6088l.; 2753 bags of ginger, at two pounds five shillings per bag, 6194l.; 2211 hides, at seven shillings per hide, 773l.; 16,475 puncheons of rum, at 10l. per puncheon, 164,750l. Mahogany, 15,282 pieces and 8500 feet, 50,000l. Of pimento, 2,089,734 pounds weight, 52,243l. Sugar, 57,675 hogheads, 6425 tierces, 52 barrels, at seventeen pounds ten shillings per hoghead, twelve pounds per tierce, and four pounds per barrel, amounting in the whole to 1,086,620l. Sarsaparilla, 205 bags, at ten pounds per bag, 2250l. Exports to Great Britain and Ireland, 1,391,210l. To North America, 146,324l. To the other islands, 595l. Total of the exports, 1,538,730l.

The following is a general view of the property and chief produce of the whole island in 1786, as prefixed by Mr Beckford to his descriptive account of Jamaica.

Counties.	Sugar Estates.	Other Settlements.	Slaves.	Produce Hhds. of Sugar.	Cattle.
Middlesex	323	917	87100	31500	75000
Surry	350	540	75600	34900	80000
Cornwall	388	561	90000	39000	69500
Total	1061	2018	255700	105400	224500

It should be here observed, that where two hogheads of sugar are made, there is at least one puncheon of rum; but the proportion has been of late years more considerable: the quantity of the latter will therefore be 52,700 puncheons.

A comparative view between the years 1768 and 1786.

	Middlesex in		Surry in		Cornwall in		Total in		Amount of Increase.
	1768	1786	1768	1786	1768	1786	1768	1786	
Sugar Estates	239	323	146	350	266	388	651	1061	410
Sugar Hhds.	24050	31500	15010	34900	29100	39000	68160	105400	37240
Negroes	66744	87100	39542	75600	60614	93000	166900	255700	88800
Cattle	59510	75000	21465	80000	54775	69500	135750	224500	88750

James

From the above scheme it appears, how considerable has been the increase of sugar-estates, and consequently of produce of negroes and cattle in eighteen years: and in the same portion of time (it is said), if proper encouragement were given, they might be augmented in a threefold proportion.

The common valuation of an estate in Jamaica is as follows:

Cane land (the canes upon it valued separately) at	-	-	£ 22 per acre.
Plants	-	-	22 ditto.
Cane land, in ratoons and young plants,	15	-	ditto.
Pasture land	-	-	8 ditto.
Wood land	-	-	4 ditto.
Provisions	-	-	14 ditto.
Negroes	-	-	57 ditto.
Mules	-	-	22 ditto.
Steers	-	-	10 ditto.
Breeding cattle, &c.	-	-	5 ditto.
Works, water, carts, &c.	-	-	from 7 to 10,000.

If a planter would wish to lease his estate for a number of years, his income would be large if he could get only 10d. sterling a day for his negroes (the loss made good), without requiring any thing for his land or works.

JAMBI, or JAMBIS, a sea-port town and small kingdom of Asia, on the eastern coast of the island of Sumatra. It is a trading place. The Dutch have a fort here; and export pepper from thence, with the best sort of canes. E. Long. 105. 55. S. Lat. 0. 30.

JAMBIA VICUS. See YAMBO.

IAMBIC, in ancient poetry, a sort of verse, so called from its consisting either wholly, or in great part, of iambus's. See IAMBUS.

Ruddiman makes two kinds of iambic, viz. dimeter and trimeter; the former containing four feet, and the latter six. And as to the variety of their feet, they consist wholly of iambus's, as in the two following verses of Horace:

1 2 3 4 5 6
Dim. *Inar*{*si* a|*stus*|*sus*}
Trim. *Suis*{*is* i|*psa* Ro|*ma* vi|*ribus*;*rui*).

Or, a dactylus, spondeus, anapestus, and sometimes tribrachys, obtain in the odd places; and the tribrachys also in the even places, excepting the last.— Examples of all which may be seen in Horace; as,

Dimeter.
1 2 3 4 5 6
*Canidi*a tra|*ctavi*|*dapes*|
*Vide*re prope|*rantes* domum|
Trimeter.
Quò quò|*scel*e|*sti* rui|*tis* aut|*cur* dex|*teris*.
Prius que ca|*sum* si|*det* in|*feri*us|*mari*.
Alii bus a|*que* can|*ibus* homi|*cid* Hel|*ectorem*.
Pavidum que lepo|*tr* aut ad|*venam* laque|*ogr*uem.

JAMBLICUS, the name of two celebrated Platonic philosophers, one of whom was of Colchis, and the other of Apamea in Syria. The first, whom Julian equals to Plato, was the disciple of Anatolius and Porphyry, and died under the reign of the emperor

Constantine.—The second also enjoyed great reputation. Julian wrote several letters to him, and it is said he was poisoned under the reign of Valens.—It is not known to which of the two we ought to attribute the works we have in Greek under the name of *Jamblicus*, viz. 1. The history of the life of Pythagoras, and the sect of the Pythagoreans. 2. An exhortation to the study of philosophy. 3. A piece against Porphyry's letter on the mysteries of the Egyptians.

JAMBOLIFERA, a genus of plants, belonging to the octandria class; and in the natural method ranking with those of which the order is doubtful. See BOTANY Index.

IAMPUS, in the Greek and Latin prosody, a poetical foot, consisting of a short syllable followed by a long one; as in

Ἰαμὸς λυγρὸς, *Deci, meas.*

Syllaba longa brevi subjeeta vocatur iambus, as Horace expresses it; who also calls the iambus a swift, rapid foot, *pes citus*.

The word, according to some, took its rise from Iambus, the son of Pan and Echo, who invented this foot; or, perhaps, who only used sharp biting expressions to Ceres, when afflicted for the death of Proserpine. Others rather derive it from the Greek *ios, venenum* "poison;" or from *ιαμωζω maledico*, "I rail, or revile;" because the verses composed of iambus's were at first only used in satire.

JAMES, Sr, called the *Greater*, the son of Zebedee, and the brother of John the evangelist, was born at Bethsaida, in Galilee. He was called to be an apostle, together with St John, as they were mending their nets with their father Zebedee, who was a fisherman; when Christ gave them the name of *Boanerges*, or *Sons of Thunder*. They then followed Christ, were witnesses with St Peter of the transfiguration on Mount Tabor, and accompanied our Lord in the garden of olives. It is believed that St James first preached the gospel to the dispersed Jews; and afterwards returned to Judea, where he preached at Jerusalem, when the Jews raised up Herod Agrippa against him, who put him to a cruel death about the year 44. Thus St James was the first of the apostles who suffered martyrdom. St Clement of Alexandria relates, that his accuser was so struck with his constancy, that he became converted and suffered with him. There is a magnificent church at Jerusalem which bears the name of *St James*, and belongs to the Armenians. The Spaniards pretend, that they had St James for their apostle, and boast of possessing his body; but Baronius, in his Annals, refutes their pretensions.

JAMES, *St*, called the *Less*, an apostle, the brother of Jude, and the son of Cleophas and Mary the sister of the mother of our Lord, is called in Scripture the *Juss*, and the *brother* of Jesus, who appeared to him in particular after his resurrection. He was the first bishop of Jerusalem, when Annanias II. high priest of the Jews, caused him to be condemned, and delivered him into the hands of the people and the Pharisees, who threw him down from the steps of the temple, when a fuller dashed out his brains with a club, about the year 62. His life was so holy, that Josephus con-

James. siders the ruin of Jerusalem as a punishment inflicted on that city for his death. He was the author of the epistle which bears his name.

St James of the Sword, (San Jago del Espada), a military order in Spain, instituted in 1170, under the reign of Ferdinand II. king of Leon and Galicia. Its end was to put a stop to the incursions of the Moors; three knights obliging themselves by a vow to secure the roads. An union was proposed and agreed to in 1170 between these and the canons of St Eloy; and the order was confirmed by the pope in 1175. The highest dignity in that order is that of grand master, which has been united to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations on both sides; they must also make it appear, that their said ancestors have neither been Jews, Saracens, nor heretics; nor even to have been called in question by the inquisition. The novices are obliged to serve six months in the galleys, and to live a month in a monastery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permission to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, since the year 1652, they have added that of defending the immaculate conception of the holy Virgin. Their habit is a white cloak, with a red cross on the breast. This is esteemed the most considerable of all the military orders in Spain: the king carefully preserves the office of grand master in his own family, on account of the rich revenues and offices, whereof it gives him the disposal. The number of knights is much greater now than formerly, all the grandees choosing rather to be received into this than into the order of the golden fleece; inasmuch as this puts them in a fair way of attaining to commands, and gives them many considerable privileges in all the provinces of Spain, but especially in Catalonia.

JAMES, the name of several kings of Scotland and of Great Britain. See (*Histories of*) SCOTLAND and BRITAIN.

JAMES I. king of Scotland in 1423, the first of the house of Stuart, was not only the most learned king, but the most learned man, of the age in which he flourished. This ingenious and amiable prince fell into the hands of the enemies of his country in his tender youth, when he was flying from the snares of his unnatural ambitious uncle, who governed his dominions, and was suspected of designs against his life. Having secretly embarked for France, the ship was taken by an English privateer off Flamborough-head; and the prince and his attendants (among whom was the earl of Orkney) were confined in a neighbouring castle until they were sent to London. See (*History of*) SCOTLAND.

The king of England knew the value of the prize he had obtained, and kept it with the most anxious care. The prince was conducted to the Tower of London immediately after he was seized, April 12. A. D. 1405, in the 13th year of his age; and there kept a close prisoner till June 10. A. D. 1407, when he was removed to the castle of Nottingham, from whence he was brought back to the Tower, March 1. A. D. 1414, and there confined till August 3. in the same year, when he was conveyed to the castle of

Windfor, where he was detained till the summer of A. D. 1417; when Henry V. for political reasons, carried him with him into France in his second expedition. In all these fortresses, his confinement, from his own account of it, was so severe and strict, that he was not so much as permitted to take the air. In this melancholy situation, so unsuitable to his age and rank, books were his chief companions, and study his greatest pleasure. He rose early in the morning, immediately applied to reading, to divert him from painful reflections on his misfortunes, and continued his studies, with little interruption, till late at night. James being naturally sensible, ingenious, and fond of knowledge, and having received a good education in his early youth, under the direction of Walter Wardlaw bishop of St Andrew's, by this close application to study, became an universal scholar, an excellent poet, and exquisite musician. That he wrote as well as read much, we have his own testimony, and that of all our historians who lived near his time. Bowmaker, the continuator of Fordun, who was his contemporary, and personally acquainted with him, spends ten chapters in his praises, and in lamentations on his death; and, amongst other things, says, that his knowledge of the scriptures, of law, and philosophy, was incredible. Hector Boece tells us, that Henry IV. and V. furnished their royal prisoner with the best teachers in all the arts and sciences; and that, by their assistance, he made great proficiency in every part of learning and the fine arts; that he became a perfect master in grammar, rhetoric, poetry, music, and all the secrets of natural philosophy, and was inferior to none in divinity and law. He observes further, that the poems he composed in his native tongue were so beautiful, that you might easily perceive he was born a poet; but that his Latin poems were not so faultless; for though they abounded in the most sublime sentiments, their language was not so pure, owing to the rudeness of the times in which he lived. This prince's skill in music was remarkable.

Walter Bower abbot of Inch-ccolm, who was intimately acquainted with that prince, assures us, that he excelled all mankind in that art both vocal and instrumental; and that he played on eight different instruments (which he names), and especially on the harp, with such exquisite skill, that he seemed to be inspired*. King James was not only an excellent performer, but also a capital composer, both of sacred and secular music; and his fame on that account was extensive, and of long duration. Above a century after his death, he was celebrated in Italy as the inventor of a new and pleasing kind of melody, which had been admired and imitated in that country. This appears from the following testimony of Alessandro Tassoni, a writer who was well informed, and of undoubted credit. "We may reckon among us moderns, James king of Scotland, who not only composed many sacred pieces of vocal music, but also of himself invented a new kind of music, plaintive and melancholy, different from all other; in which he hath been imitated by Carlo Gesualdo prince of Venosa, who, in our age, hath improved music with new and admirable inventions." † As the prince of Venosa imitated King James, the other musicians of Italy imitated prince of Venosa. "The most noble Carlo Gesualdo, in

James.

* *Scoticbron.* lib. 16. c. 18.† *Alessand. Tass. Pen-* scri Diversi lib. 10. Sir John Hawkins, vol. i. do, p. 5, 6.

James. do, the prince of musicians of our age, introduced such a style of modulation, that other musicians yielded the preference to him; and all singers and players on stringed instruments, laying aside that of others, everywhere embraced his †. All the lovers, therefore, of Italian or Scotch music, are much indebted to the admirable genius of King James I. who, in the gloom and solitude of a prison, invented a new kind of music, plaintive indeed, and suited to his situation, but at the same time so sweet and soothing, that it hath given pleasure to millions in every succeeding age.

As James I. of Scotland was one of the most accomplished princes that ever filled a throne, he was also one of the most unfortunate. After spending almost 20 years in captivity, and encountering many difficulties on his return into his native kingdom, he was murdered by barbarous assassins in the prime of life. In the monuments of his genius, he hath been almost equally unfortunate. No vestiges are now remaining of his skill in architecture, gardening, and painting; though we are assured by one who was well acquainted with him, that he excelled in all these arts*. Many of the productions of his pen have also perished; for he tells us himself that he wrote much †; and we know of only three of his poems that are now extant, viz. Christ's Kirk on the Green—Peebles at the Play—and the King's Quair, which was lately discovered by Mr Warton, and hath been published by another gentleman †. But slender as these remains are, they afford sufficient evidence, that the genius of this royal poet was not inferior to that of any of his contemporaries; and that it was equally fitted for the gayest or the gravest strains.

JAMES II. king of Scotland, 1437, succeeded his father, being then not seven years of age; and was killed at the siege of Roxburgh in 1460, aged 29.

JAMES III. king of Scotland, succeeded his father, in 1460, in the 7th year of his age. The most striking feature in the character of this prince, unjustly represented as tyrannical by several historians, was his fondness for the fine arts, and for those who excelled in them, on whom he bestowed more of his company, confidence, and favour, than became a king in his circumstances. This excited in his fierce and haughty nobles dislike and contempt of their sovereign, and indignation against the objects of his favour; which produced the most pernicious consequences, and ended in a rebellion that proved fatal to James, who was slain in 1488, aged 36.

JAMES IV. king of Scotland, succeeded his father in 1488. He was a pious and valiant prince; subdued his rebellious subjects; and afterwards, taking part with Louis XII. against Henry VIII. of England, he was slain in the battle of Flodden-field in 1513, aged 41.—This king is acknowledged to have had great accomplishments both of mind and body. His Latin epistles are classical, compared with the barbarous style of the foreign princes with whom he corresponded. Like his father, he had a taste for the fine arts, particularly that of sculpture. The attention he paid to the civilization of his people, and his distribution of justice, merit the highest praise. After all, the virtues of James appear to have been more shining than solid: and his character was that of a fine gentleman and a brave knight, rather than a wise or a great

monarch. At the time of his death, he was only in his forty first year. Like all the princes of his family (to his great grandson James VI.) his person was handsome, vigorous, and active. From their coins, it does not appear that either he, or any of his predecessors of the Stuart race, wore their beards, as did all his successors, to the reign of Charles II.

JAMES V. king of Scotland, in 1513, was but 18 months old when his father lost his life. When of age, he assisted Francis I. king of France against the emperor Charles V.; for which service Francis gave him his eldest daughter in marriage, in 1535. This prince died in two years; and James married Mary of Lorraine, daughter of Claud duke of Guise, and widow of Louis d'Orleans, by whom he had only one child, the unfortunate Mary queen of Scots, born only eight days before his death, which happened December 13, 1542, in the 35th year of his age. This was the first prince of his family who died a natural death since its elevation to the throne. He died, however, of a broken heart, occasioned by differences with his barons. He was formed by nature to be the ornament of a throne and a blessing to his people; but his excellent endowments were rendered in a great measure ineffectual by an improper education. Like most of his predecessors, he was born with a vigorous, graceful person, which, in the early part of his reign, was improved by all the manly exercises then in use. This prince was the author of a humorous composition in poetry, which goes by the name of the *Gabertunzie Man*.

JAMES VI. king of Scotland in 1567, and of England in 1603, was son of Mary queen of Scots; whom he succeeded in Scotland, as he did Elizabeth in England. Strongly attached to the Protestant religion, he signalled himself in its support; which gave rise to the horrid conspiracy of the Papists to destroy him and all the English nobility by the Gunpowder Plot, discovered November 5. 1605. The following year, a political test of loyalty was required, which secured the king's person, by clearing the kingdom of those disaffected Roman Catholic subjects who would not submit to it. The chief glory of this king's reign consisted in the establishment of new colonies, and the introduction of some manufactures. The nation enjoyed peace, and commerce flourished during his reign. Yet his administration was despised both at home and abroad: for, being the head of the Protestant cause in Europe, he did not support it in that great crisis, the war of Bohemia; abandoning his son-in-law the elector Palatine; negotiating when he should have fought, deceived at the same time by the courts of Vienna and Madrid; continually sending illustrious ambassadors to foreign powers, but never making a single ally. He valued himself much upon his polemical writings; and so fond was he of theological disputations, that to keep them alive, he founded, for this express purpose, Chelsea-college; which was converted to a much better use by Charles II. His *Basilicon Doron*, Commentary on the Revelation, writings against Bellarmine, and his *Dæmonologia*, or doctrine of witchcraft, are sufficiently known. There is a collection of his writings and speeches in one folio volume. Several other pieces of his are extant; some of them in the Cabala, others in manuscript in the British Museum,

James.

and others in Howard's collection. He died in 1625, in the 59th year of his age, and 23d of his reign.

JAMES II. king of England, Scotland, &c. 1685, grandson of James I. succeeded his brother Charles II. It is remarkable, that this prince wanted neither courage nor political abilities whilst he was duke of York; on the contrary, he was eminent for both: but when he ascended the throne, he was no longer the same man. A bigot from his infancy to the Romish religion and to its hierarchy, he sacrificed every thing to establish them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the Jesuit Peters his confessor, and the infamous chancellor Jeffries, he violated every law enacted for the security of the Protestant religion; and then, unable to face the resentment of his injured subjects, he fled like a coward, instead of disarming their rage by a dismissal of his Popish ministers and priests. He rather chose to live and die a bigot, or, as he believed, a saint, than to support the dignity of his ancestors, or perish beneath the ruins of his throne. The consequence was the revolution in 1689. James II. died in France in 1710, aged 68. He wrote Memoirs of his own life and campaigns to the restoration; the original of which is preserved in the Scotch college at Paris. This piece is printed at the end of Ramlay's life of Marshal Turenne. 2. Memoirs of the English affairs, chiefly naval, from the year 1660 to 1673. 3. The royal sufferer, King James II. consisting of meditations, soliloquies, vows, &c. said to be composed by his majesty at St Germain. 4. Three letters; which were published by William Fuller, gent. in 1702, with other papers relating to the court of St Germain, and are said in the title page to be printed by command.

JAMES, Thomas, a learned English critic and divine, born about the year 1571. He recommended himself to the office of keeper of the public library at Oxford, by the arduous undertaking of publishing a catalogue of the MSS in each college library at both universities. He was elected to this office in 1602, and held it 18 years, when he resigned it to prosecute his studies with more freedom. In the convocation held with the parliament at Oxford in 1625, of which he was a member, he moved to have proper commissioners appointed to collate the MSS of the fathers in all the libraries in England, with the Popish editions, in order to detect the forgeries in the latter; but this proposal not meeting with the desired encouragement, he engaged in the laborious task himself, which he continued until his death in 1629. He left behind him a great number of learned works.

JAMES, Richard, nephew of the former, entered into orders in 1615: but, being a man of humour, of three sermons preached before the university, one concerning the observation of Lent was without a text, according to the most ancient manner; another against the text; and the third beside it. About the year 1619, he travelled through Wales, Scotland, Shetland, into Greenland and Russia, of which he wrote observations. He assisted Selden in composing his *Marmora Arundeliana*; and was very serviceable to Sir Robert Cotton, and his son Sir Thomas, in disposing and settling their noble library. He died in

1638; and has an extraordinary character given him by Wood for learning and abilities.

JAMES, Dr Robert, an English physician of great eminence, and particularly distinguished by the preparation of a most excellent fever-powder, was born at Kinverston in Staffordshire, A. D. 1703: his father a major in the army, his mother a sister of Sir Robert Clarke. He was of St John's-college in Oxford, where he took the degree of A. B. and afterwards practised physic at Sheffield, Lichfield, and Birmingham successively. Then he removed to London, and became a licentiate in the college of physicians; but in what years is not known. At London he applied himself to writing as well as practising physic; and in 1743, published a Medical Dictionary, in 3 vols folio. Soon after he published an English translation, with a Supplement by himself, of *Ramazzini de morbis artificum*; to which he also prefixed a piece of Frederic Hoffman upon Endemical Distempers, 8vo. In 1746, The Practice of Physic, 2 vols 8vo; in 1760, On Canine Madness, 8vo; in 1764, A Dispensatory, 8vo. June 25. 1755, when the king was at Cambridge, James was admitted by mandamus to the doctorship of physic. In 1788, were published, A Dissertation upon Fevers, and A Vindication of the Fever-powder, 8vo; with A Short Treatise on the Disorders of Children, and a very good print of Dr James. This was the 8th edition of the Dissertation, of which the first was printed in 1751; and the purpose of it was, to set forth the success of this powder, as well as to describe more particularly the manner of administering it. The Vindication was posthumous and unfinished: for he died March 23. 1776, while he was employed upon it.—Dr James was married, and left several sons and daughters.

JAMES'S Powder, a medicine prepared by Robert James, which is known also by the name of *James's fever powder*. See MATERIA MEDICA Index.

JAMES'S Town, a borough and market town of Ireland, in the county of Leitrim, and province of Connaught; situated five miles north-west of Carrick, on Shannon, and 73 north-west of Dublin, in N. Lat. 53. 44. W. Long. 8. 15. It has a barrack for a company of foot, and returns two members to parliament; patronage in the family of King.—It has three fairs.

St JAMES'S Day, a festival of the Christian church, observed on the 25th of July, in honour of St James the greater, son of Zebedee.

Epistle of St JAMES, a canonical book of the New Testament, being the first of the *catholic* or *general* epistles; which are so called, as not being written to one but to several Christian churches.

This general epistle is addressed partly to the believing and partly to the infidel Jews; and is designed to correct the errors, soften the ungoverned zeal, and reform the indecent behaviour of the latter; and to comfort the former under the great hardships they then did, or shortly were to suffer, for the sake of Christianity.

JAMESONE, GEORGE, an excellent painter, justly termed the *Vandyck of Scotland*, was the son of Andrew Jamesone, an architect; and was born at Aberdeen, in 1586. He studied under Rubens, at Antwerp; and, after his return, applied with indefatigable industry to portraits in oil, though he sometimes practised

James.
Jamesone.

Jamyn,
Jane.

practised in miniature, and also in history and landscapes. His largest portraits were somewhat less than life. His earliest works are chiefly on board, afterwards on a fine linen cloth smoothly primed with a proper tone to help the harmony of his shadows. His excellence is said to consist in delicacy and softness, with a clear and beautiful colouring; his shades not charged, but helped by varnish, with little appearance of the pencil. When King Charles I. visited Scotland in 1633, the magistrates of Edinburgh, knowing his majesty's taste, employed this artist to make drawings of the Scottish monarchs; with which the king was so pleased, that, enquiring for the painter, he sat to him, and rewarded him with a diamond ring from his own finger. It is observable, that Jamesone always drew himself with his hat on, either in imitation of his master Rubens, or on having been indulged in that liberty by the king when he sat to him. Many of Jamesone's works are in both the colleges of Aberdeen; and the Sibyls there he is said to have drawn from living beauties in that city. His best works are from the year 1630 to his death, which happened at Edinburgh in 1644.

JAMYN, AMADIS, a celebrated French poet in the 16th century. He is esteemed the rival of Ronfard, who was his cotemporary and friend. He was secretary and chamber-reader in ordinary to Charles IX. and died about 1585. He wrote, 1. Poetical works, two vols. 2. Philosophical discourses to Pasicharis and Rodanthe, with seven academical discourses. 3. A translation of the Iliad of Homer, begun by Hugh Sabel, and finished by Jamyn; with a translation into French verse of the three first books of the Odysey.

JANE of FLANDERS, a remarkable lady, who seems to have possessed in her own person all the excellent qualities of both sexes, was the wife of John de Mountfort, a competitor for the dukedom of Brittany upon the death of John III. This duke, dying without issue, left his dominions to his niece Jane, married to Charles de Blois nephew to the king of France; but John de Mountfort, brother to the late duke though by a second marriage, claimed the duchy, and was received as successor by the people of Nantes. The greatest part of the nobility swore fealty to Charles de Blois, thinking him best supported. This dispute occasioned a civil war; in the course of which John was taken prisoner, and sent to Paris. This misfortune would have entirely ruined his party, had not his interest been supported by the extraordinary abilities of his wife, Jane of Flanders. Bold, daring, and intrepid, she fought like a warrior in the field; shrewd, sensible, and sagacious, she spoke like a politician in the council; and endowed with the most amiable manners and winning address, she was able to move the minds of her subjects by the force of her eloquence, and mould them exactly according to her pleasure. She happened to be at Rennes when she received the news of her husband's captivity; but that disaster, instead of depressing her spirits, served only to rouse her native courage and fortitude. She forthwith assembled the citizens; and, holding in her arms her infant son, recommended him to their care and protection in the most pathetic terms, as the male heir of their ancient dukes, who had always governed them with lenity and indulgence, and to whom they had ever professed the most zealous attachment. She

declared herself willing to run all hazards with them in so just a cause; pointed out the resources that still remained in the alliance of England; earnestly beseeching them to make one vigorous effort against an usurper, who being forced upon them by the intrigues of France, would, as a mark of his gratitude, sacrifice the liberties of Brittany to his protector. The people moved by the affecting appearance, and animated by the noble conduct of the princess, vowed to live and die with her in defending the rights of her family; and their example was followed by almost all the Bretons. The countess went from place to place, encouraging the garrisons of the several fortresses, and providing them with every thing necessary for their subsistence: after which she shut herself up with her son in Hennebon, where she resolved to wait for the succours which the king of England (Edward III.) had promised to send to her assistance. Charles de Blois, accompanied by the dukes of Burgundy and Bourbon, and many other noblemen, took the field with a numerous army, and having reduced Rennes, laid siege to Hennebon, which was defended by the countess in person. This heroine repulsed the assailants in all their attacks with the most undaunted courage; and observing one day that their whole army had left the camp to join in a general storm, she rushed forth at a postern-gate, with three hundred horse, set fire to their tents and baggage, killed their sutlers and servants, and raised such a terror and consternation through all their quarters, that the enemy gave over their assault, and getting betwixt her and the walls, endeavoured to cut off her retreat to the city. Thus intercepted, she put the spurs to her horse, and without halting, galloped directly to Brest, which lay at the distance of two-and-twenty miles from the scene of action. There being supplied with a body of five hundred horse, she immediately returned, and fighting her way through one part of the French camp, was received into Hennebon, amidst the acclamations of the people. Soon after this the English succours appeared, and obliged the enemy to raise the siege.

JANEIRO, or RIO-JANEIRO, a river and province of Brazil in South America, seated between the tropic of Capricorn and 22° of S. Lat. See RIO-JANEIRO.

JANICULUM, or JANICULARIS, a hill of ancient Rome, added by Ancus Martius; the burial place of Numa, and of Statius Cæcilius the poet: to the east and south, having the Tiber; to the west, the fields; to the north, a part of the Vatican. So called, either from an ancient city, (Virgil); or because it was a *janua*, or gate, from which to issue out and make incursions on the Tuscans, (Verrius Flaccus.) Now called *Mons Aureus*, corruptly *Montorio*, from its sparkling sands. From this hill, on account of its height, is the most extensive prospect of Rome: but it is less inhabited, because of its gross air; neither is it reckoned among the seven hills. Hither the people retired, and were hence afterwards recalled by Q. Hortensius the dictator, (Plin.)

JANIZARIES, an order of infantry in the Turkish armies; reputed the grand seignior's foot-guards. Vossius derives the word from *genizers*, which in the Turkish language signifies *novi homines* or *milites*. D'Herbelot tell us, that *jenischeri* signifies a *new band*, or *troup*; and that the name was first given by Amara-
rath

Janerio
||
Janizaries

Janizaries,
Janfen.

rath I. called the *Conqueror*, who choosing out one-fifth part of the Christian prisoners whom he had taken from the Greeks, and instructing them in the discipline of war and the doctrines of their religion, sent them to Hagi Bektasche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops.—Bektasche, after blessing them in his manner, cut off one of the sleeves of the fur-gown which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Christ 1361, they have still retained the name *jenitcheri*, and the sui-cap.

As, in the Turkish army, the European troops are distinguished from those of Asia; the janizaries are also distinguished into *janizaries of Constantinople*, and of *Damascus*. Their pay is from two aspers to twelve *per diem*; for when they have a child, or do any signal piece of service, their pay is augmented.—Their dress consists of a dolyman, or long gown, with short sleeves, which is given them annually by the grand seignior on the first day of Ramazan. They wear no turbeau; but, in lieu of that, a kind of cap, which they call *zarcola*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with feathers, which are stuck in a little case on the fore part of the bonnet.—Their arms, in Europe, in time of war, are a sabre, a carabine or musket, and a cartouch-box hanging on the left side. At Constantinople, in time of peace, they wear only a long staff in their hand. In Asia, where powder and fire-arms are more uncommon, they wear a bow and arrows, with a poignard, which they call *hantare*.—Though the janizaries are not prohibited marriage, yet they rarely marry, nor then but with the consent of their officers; as imagining a married man to make a worse soldier than a bachelor.—It was Osman, or Ottoman, or, as others will have it, Amurath, who first instituted the order of janizaries. They were at first called *jaja*, that is, footmen, to distinguish them from the other Turks, the troops whereof consisted mostly of cavalry. The number of janizaries is generally above 40,000; divided into 162 companies or chambers called *odas*, in which they live together at Constantinople as in a convent. They are of a superior rank to all other soldiers, and are also more arrogant and factious, and it is by them that the public tranquillity is mostly disturbed. The government may therefore be said to be in the hands of the janizaries. They have, however, some good qualities: they are employed to escort travellers, and especially ambassadors and persons of high rank, on the road; in which case they behave with the utmost zeal and fidelity.

JANIZARIES, at Rome, are officers or pensioners of the pope, called also *participantes*, on account of certain rites or duties which they enjoy in the annates, bulls, or expeditions, and the Roman chancery.—Most authors are mistaken in the nature of their office: the truth is, they are officers of the third bench or college of the Roman chancery. The first bench consists of writers, the second of abbreviators, and the third of *janizaries*; who are a kind of correctors and revisors of the pope's bulls.

JANSEN, CORNELIUS, bishop of Ypres, one of the

most learned divines of the 17th century, and principal of the sect called from his name *Janfenists*. He was born in Holland of Catholic parents, and studied at Louvain. Being sent to transact some business of consequence relating to the university, into Spain, the Catholic king, viewing with a jealous eye the intriguing policy of France, engaged him to write a book to expel the French to the pope as no good Catholics, since they made no scruple of forming alliances with Protestant states. Janfen performed this task in his *Mars Gallicus*; and was rewarded with a mitre, being promoted to the see of Ypres in 1635. He had, among other writings, before this, maintained a controversy against the Protestants upon the points of grace and predestination; but his *Augustinus* was the principal labour of his life, on which he spent above 20 years. See the next article.

JANSENISTS, in *Church History*, a sect of the Roman Catholics in France, who followed the opinions of Janfenius, bishop of Ypres, and doctor of divinity of the universities of Louvain and Douay, in relation to grace and predestination.

In the year 1640, the two universities just mentioned, and particularly Father Molina and Father Leonard Cellus, thought fit to condemn the opinions of the Jesuits on grace and free-will. This having set the controversy on foot, Janfenius opposed to the doctrine of the Jesuits the sentiments of St Augustine; and wrote a treatise on grace, which he entitled *Augustinus*. This treatise was attacked by the Jesuits, who accused Janfenius of maintaining dangerous and heretical opinions; and afterwards, in 1642, obtained of Pope Urban VIII. a formal condemnation of the treatise written by Janfenius: when the partizans of Janfenius gave out that this bull was spurious, and composed by a person entirely devoted to the Jesuits. After the death of Urban VIII. the affair of Janfenism began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace. And what occasioned some mirth, was the titles which each party gave to their writings; one writer published *The torch of St Augustine*, another found *Snuffers for St Augustine's torch*, and Father Veron formed *Agag for the Janfenists*, &c. In the year 1650, 68 bishops of France subscribed a letter to Pope Innocent X. to obtain an inquiry into and condemnation of the five following propositions, extracted from Janfenius's *Augustinus*: 1. Some of God's commandments are impossible to be observed by the righteous, even though they endeavour with all their power to accomplish them. 2. In the state of corrupted nature, we are incapable of resisting inward grace. 3. Merit and demerit, in a state of corrupted nature, does not depend on a liberty which excludes necessity, but on a liberty which excludes constraint. 4. The Semipelagians admitted the necessity of an inward preventing grace for the performance of each particular act, even for the beginning of faith: but they were heretics in maintaining that this grace was of such a nature, that the will of man was able either to resist or obey it. It is Semipelagianism to say, that Jesus Christ died, or shed his blood, for all mankind in general.

In the year 1652, the pope appointed a congregation for examining into the dispute in relation to grace. In this congregation Janfenius was condemned; and the

Janfenists

Janssens. the bull of condemnation, published in May 1653, filled all the pulpits in Paris with violent outcries and alarms against the heresy of the Jansenists. In the year 1656, Pope Alexander VII. issued out another bull, in which he condemned the five propositions of Jansenius. However, the Jansenists affirm, that these propositions are not to be found in this book; but that some of his enemies having caused them to be printed on a sheet, inserted them in the book, and thereby deceived the pope. At last Clement XI. put an end to the dispute by his constitution of July 17. 1705; in which, after having recited the constitutions of his predecessors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal constitutions concerning the present question, it is necessary to receive them with a respectful silence." The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppose it.

This is the famous bull *Unigenitus*, so called from its beginning with the words *Unigenitus Dei Filius*, &c. which has occasioned so much confusion in France.

JANSSENS, ABRAHAM, history-painter, was born at Antwerp in 1569. He was cotemporary with Rubens, and also his competitor, and in many of the finest parts of the art was accounted not inferior to that celebrated master. It is reported, that having wasted his time and his substance by a life of dissipation and pleasure, and falling into necessitous circumstances, which he imputed more to ill fortune than to his own neglect of his business, he grew envious at the grandeur in which Rubens appeared, and impatient at his merit and success; and with peevish insolence challenged him to paint a picture with him only for fame, which he was willing to submit to impartial judges. But Rubens rejected the proposal, answering with modesty, that he freely submitted to him, and the world would certainly do justice to them both.

Sandrart, who had seen several of his works, assures us, that he not only gave a fine roundness and relief to his figures, but also such a warmth and clearness to the carnations, that they had all the look of real flesh; and his colouring was as durable as it was beautiful, retaining its original lustre for a number of years. His most capital performance is said to be the resurrection of Lazarus, which is in the cabinet of the elector Palatine, and is an object of admiration to all who behold it.

JANSSENS, Victor Honorius, history-painter, was born at Brussels in 1664, and was a disciple of one Volders, under whose direction he continued for seven years; in which time he gave many proofs of a genius far superior to those who were instructed in the same school. He afterwards went to Rome, where he attended particularly the works of Raphael; he designed after the antiques, and sketched the beautiful scenes around that city; and in a short time his paintings rose in esteem, and the principal nobility of Rome were desirous to employ him. He associated with Tempesta, the celebrated landscape-painter, for several years, and painted the figures in the works of that great master as long as they resided together.

Janssens composed historical subjects, both in a small and a large size; but he found the demand for his small pictures so considerable, that he was induced to

paint most frequently in that size. During 11 years he continued at Rome, which barely sufficed for his finishing those pictures for which he was engaged; nor could he have even then been at his liberty, had he not limited himself to a number, and determined not to undertake more.—Returning to Brussels, his performances were as much admired there as they had before been in Italy; but having married, and gradually become the father of 11 children, he was compelled to change his manner of painting in small, and to undertake only those of the large kind, as being more lucrative, more expeditious, and also more agreeable to his genius and inclination. He adorned most of the churches and palaces of his own country with his compositions.—The invention of this artist was fruitful; he designed correctly, his colouring is natural and pleasing, his pencil free, and the airs of his heads have beauty and elegance. As to the difference between his large and small paintings, it is observed, that in correctness and taste they had an equal degree of merit; but the colouring of the former appears more raw and cold than the colouring of the latter; and it is agreed, that for small historical pictures, he was preferable to all the painters of his time.

JANSSEN, Cornelius, called *Johnson*, an eminent painter of portraits, was born at Amsterdamb (though in the Chronological tables, and in Sandrart, it is improperly asserted that he was born in London), and he resided in England for several years; where he was engaged in the service of King James I. and painted several excellent portraits of that monarch, as also of his children and of the principal nobility of his court. He had not the freedom of hand, nor the grace of Vandyck; but in other respects he was accounted his equal, and in the finishing his pictures superior. His paintings are easily distinguished by their smooth, clear, and delicate tints, and by that character of truth and nature with which they are strongly marked. He generally painted on board; and, for the most part, his draperies are black; probably because the opposition of that tint made his flesh colours appear more beautifully bright, especially in his female figures. It is said that he used a quantity of ultramarine in the black colours, as well as in his carnations; which may be one great cause of their preserving their original lustre even to this day. Frequently he painted in a small size in oil, and often copied his own works in that manner. His fame began to be somewhat obscured, on the arrival of Vandyck in England; and the civil war breaking out some time after, induced him to return to his own country, where his paintings were in the highest esteem. He died in 1685.

ST JANUARIUS, the patron saint of Naples, where his head is occasionally carried in procession, in order to stay the eruption of Vesuvius. The liquefaction of his blood is a famous miracle at Naples. The saint suffered martyrdom about the end of the third century. When he was beheaded, a pious lady of Naples caught about an ounce of his blood, which has been carefully preserved in a bottle ever since, without having lost a single grain of its weight. This of itself, were it equally demonstrable, might be considered as a greater miracle than the circumstance on which the Neapolitans lay the whole stress, viz. that the blood which has congealed, and acquired a solid

form,

Januarius
January.

form by age, is no sooner brought near the head of the faint, than, as a mark of veneration, it immediately liquefies. This experiment is made three different times every year, and is considered by the Neapolitans as a miracle of the first magnitude.

The substance in the bottle, which is exhibited for the blood of the faint, has been supposed to be something naturally solid, but which melts with a small degree of heat. When it is first brought out of the cold chapel, it is in its natural solid state; but when brought before the faint by the priest, and rubbed between his warm hands and breathed upon for some time, it melts; and this is the whole mystery. But Dr Moore, though he confesses himself unable to explain on what principle the liquefaction depends, is convinced that it must be something different from this: "For he had it (he informs us) from the most satisfactory authority, from those who had opportunities of knowing, and who believe no more in the miracle than the staunchest Protestant, that this congealed mass has sometimes been found in a liquid state in cold weather, before it was touched by the priest, or brought near the head of the faint; and that, on other occasions, it has remained solid when brought before him, notwithstanding all the efforts of the priest to melt it. When this happens, the superstitious, which, at a very moderate calculation, comprehends 99 in 100 of the inhabitants of this city, are thrown into the utmost consternation, and are sometimes wrought up by their fears into a state of mind which is highly dangerous both to their civil and ecclesiastical governors. It is true, that this happens but seldom: for, in general, the substance in the phial, whatever it may be, is in a solid form in the chapel, and becomes liquid when brought before the faint: but as this is not always the case, it affords reason to believe, that whatever may have been the case when this miracle or trick, call it which you please, was first exhibited, the principle on which it depends has somehow or other been lost, and is not now understood fully even by the priests themselves; or else they are not now so expert as formerly, in preparing the substance which represents the faint's blood, so as to make it remain solid when it ought, and liquefy the instant it is required."

The head and blood of the faint are kept in a kind of press, with folding doors of silver, in the chapel of St Januarius belonging to the cathedral church. The real head is probably not so fresh and well preserved as the blood. On that account, it is not exposed to the eyes of the public; but is inclosed in a large silver bust, gilt and enriched with jewels of high value. This being what appears to the people, their idea of the faint's features and complexion are taken entirely from the bust.—The blood is kept in a small repository by itself.

JANUARY, the name of the first month of the year, according to the computation now used in the west. The word is derived from the Latin *Januarius*, a name given it by the Romans from Janus, one of their divinities, to whom they attributed two faces, because on the one side the first day of January looked towards the new year, and on the other towards the old one. The word *Januarius* may also be derived from *janua* "gate;" in regard this month being the first, is, as it were, the gate of the year.

Janus.

January and February were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March.—The kalends, or first day of this month, was under the protection of Juno, and in a peculiar manner consecrated to Janus by an offering of a cake made of new meal and new salt, with new frankincense and new wine. On the first day of January a beginning was made of every intended work, the consuls elect took possession of their office, who, with the flamens, offered sacrifices and prayers for the prosperity of the empire. On this day all amusements were suspended, and friends gave and received new year's gifts, called *Strenæ*. On this day too the Romans above all things took care to be merry and divert themselves, and oftentimes such a scene of drunkenness was exhibited, that they might with propriety enough have distinguished it with the name of *All-fools day*.

The Christians heretofore fasted on the first day of January, by way of opposition to the superstitious and debaucheries of the heathens.

JANUS, in the heathen worship, the first king of Italy, who, it is said, received Saturn into his dominions, after his being driven from Arcadia by Jupiter. He tempered the manners of his subjects, and taught them civility; and from him they learned to improve the vine, to sow corn, and to make bread. After his death, he was adored as a god.

This deity was thought to preside over all new undertakings. Hence, in all sacrifices, the first libations of wine and wheat were offered to Janus, all prayers prefaced with a short address to him; and the first month of the year was dedicated to and named from him. See JANUARY.

Janus was represented with two faces, either to denote his prudence, or that he views at once the past and approaching years; he had a sceptre in his right hand, and a key in his left, to signify his extensive authority, and his invention of locks.

Though this is properly a Roman deity, the abbé la Pluche represents it as derived from the Egyptians, who made known the rising of the dog-star, which opened their solar year, with an image with a key in its hand, and two faces, one old and the other young, to typify the old and new year.

Temple of Janus, in ancient history, a square building at Rome (as some say) of entire brass, erected by Romulus, and so large as to contain a statue of Janus five feet high, with brazen gates on each side, which were always kept open in time of war, and shut in time of peace. But the Romans were so much engaged in war, that this temple was shut only twice from the foundation of Rome till the reign of Augustus, and six times afterwards. It was first shut during the long reign of Numa, who instituted this ceremony. 2. In the year of the city 519, after the end of the first Punic war. 3. By Augustus after the battle of Actium, in the year of Rome 725. 4. On Augustus's return from the war which he had against the Cantabrians in Spain, in the year of Rome 729. 5. Under the same emperor, in 744, about five years before the birth of Christ, when there was a general peace throughout the whole Roman empire, which lasted 12 years. 6. Under Nero, 811. 7. Under Vespasian, 824. 8. Under Constantius, when, upon Magnentius's death, he was left sole possessor of the empire, 1105. Some dispute the authority

^{Janus,}
^{Japan.} authority on which it is said to have been shut by Constantinus, and say that the last time of its being shut was under Gordian, about the year of Rome 994. Virgil gives us a noble description of this custom, *Æn.* lib. iii. ver. 607. The origin of this custom is not certainly known.

JANUS was also the name of a street in Rome, inhabited for the most part by bankers and usurers. It was so called from two statues of Janus which were erected there, one at the top, the other at the bottom, of the street. The top of the street was therefore called *Janus Summus*, the bottom *Janus Imus*, and the middle *Janus Medius*. Hence Horace, lib. i. epist. 1.

Hæc Janus summus ab imo perdocet.

And Sat. 3. Lib. 2.

*Postquam
omnis res mea Janum
Ad mediam fracta est.*—

JAPAN, a general name for a great number of islands lying between the eastern coast of Asia and the western coast of America, and which all together form a large and powerful empire. They extend from the 30th to the 41st degree of north latitude, and from the 130th to the 147th of east longitude.

Were South and North Britain divided by an arm of the sea, Japan might be most aptly compared to England, Scotland, and Ireland, with their respective smaller islands, peninsulas, bays, channels, &c. all under the same monarch.

The Europeans call the empire *Japan*; but the inhabitants *Nippon*, from the greatest island belonging to it; and the Chinese *Cippon*, probably on account of its eastern situation; these names signifying, in both languages, the *Basis* or *Foundation of the Sun*. It was first discovered by the Portuguese about the year of Christ 1542.

Most of the islands which compose it are surrounded with such high craggy mountains, and such shallow and boisterous seas, that sailing about them is extremely dangerous; and the creeks and bays are choaked up with such rocks, shelves, and sands, that it looks as if Providence had designed it to be a kind of little world by itself. These seas have likewise many dangerous whirlpools, which are very difficult to pass at low water, and will suck in and swallow up the largest vessels, and all that comes within the reach of their vortex, dashing them against the rocks at the bottom; inasmuch that some of them are never seen again, and others thrown upon the surface at some miles distance. Some of these whirlpools also make a noise terrible to hear.

The Chinese pretend that the Japan islands were first peopled by themselves: but it is more probable that the original inhabitants were a mixture of different nations, driven thither by those tempestuous seas, at different times.

As these islands lie in the fifth and sixth climates, they would be much hotter in summer than England, were not the heats refreshed by the winds which continually blow from the sea around them, and to which they are much exposed by the height of their situation: this circumstance, however, not only renders their winters excessively cold, but the seasons more inconstant. They have great falls of snow in winter,

which are commonly followed by hard frosts. The rains in summer are very violent, especially in the months of June and July, which on that account are called *sat-fuki*, or *water-months*. The country is also much subject to dreadful thunders and lightnings, as well as storms and hurricanes, which frequently do a great deal of damage.

The soil, though naturally barren and mountainous, by the industry of the inhabitants, not only supplies them with every necessary of life, but also furnishes other countries with them; producing, besides corn, the finest and whitest rice and other grains, with a great variety of fruits, and vast numbers of cattle of all sorts. Besides rice, and a sort of wheat and barley, with two sorts of beans, they have Indian wheat, millet, and several other kinds in great abundance. Their seas, lakes, and rivers, abound with fish; and their mountains, woods, and forests, are well stocked with horses, elephants, deer, oxen, buffaloes, sheep, hogs, and other useful animals. Some of their mountains also are enriched with mines of gold, silver, and copper, exquisitely fine, besides tin, lead, iron, and various other minerals and fossils; whilst others abound with several sorts of marble and precious stones. Of these mountains, some may be justly ranked among the natural rarities of this country; one, in particular, in the great island of Nippon, is of such prodigious height as to be easily seen forty leagues off at sea, though its distance from the shore is about eighteen. Some authors think it exceeds the famous Peak of Teneriffe; but it may rather be called a cluster or group of mountains, among which are no less than eight dreadful volcanoes, burning with incredible fury, and often laying waste the country round about them: but, to make some amends, they afford great variety of medicinal waters, of different degrees of heat; one of these, mentioned by Varenus, is said to be as hot as burning oil, and to scorch and consume every thing thrown into it.

The many brooks and rivers that have their sources among the mountains, form a great number of delightful cascades, as well as some dreadful cataracts. Among the great variety of trees in the forests here, the cedars exceed all of that kind through India, for straightness, height, and beauty. They abound in most of the islands, especially the largest.

Their seas, besides fish, furnish them with great quantities of red and white coral, and some pearls of great value, besides a variety of sea plants and shells; which last are not inferior to those that are brought from Amboyna, the Molucca and other easterly islands.

The vast quantity of sulphur with which most of the Japan islands abounds, makes them subject to frequent and dreadful earthquakes. The inhabitants are so accustomed to them, that they are scarcely alarmed at any, unless they chance to be very terrible indeed, and lay whole towns in ruins, which very often proves the case. On these occasions, they have recourse to extraordinary sacrifices, and acts of worship, to their deities or demons, according to the different notions of each sect, and sometimes even proceed to offer human victims; but in this case they only take some of the vilest and most abandoned fellows they can meet with, because they are only sacrificed to the malevolent deities.

Japan.

The religion throughout Japan, it is well known, is Pagan, split into several sects, who live together in the greatest harmony. Every sect has its own temples and priests. The spiritual emperor, the Dairi, is the chief of their religion. They acknowledge and honour a Supreme Being. The author of this relation (Dr Thunberg) saw two temples of the God of gods of a majestic height. The idol that represented this god was of gilded wood, and of so prodigious a size, that upon his hands six persons might sit in the Japanese fashion; his shoulders were five toises broad. In the other temple, the infinite power of this god was represented by little gods to the number of 33,333, all standing round the great idol that represented God. The priests, who are numerous in every temple, have nothing to do but to clean the pavement, light the lamps, and dress the idol with flowers. The temples are open to every body, even to the Hollanders; and in case they are in want of a lodging in the suburbs, when they go to the court of Jeddo, they are entertained with hospitality in these temples.

The Roman Catholic religion had once made a considerable progress in this country, in consequence of a mission conducted by the Portuguese and Spanish Jesuits; among whom the famous Saint Francis Xavier was employed, but soon relinquished the service. There were also some Franciscan friars of Spain engaged at last. The Jesuits and friars were supplied from Goa, Macao, and the Manilhas. At first the undertaking proceeded with the most rapid success, but ended at last in the most tragical manner, all owing to the pride and haughtiness, the misconduct, rapacity, and senseless extravagant conspiracy of the fathers against the state. This folly and madness produced a persecution of 40 years duration, terminated by a most horrible and bloody massacre, not to be paralleled in history. After this the Portuguese, as likewise the Christian religion, were totally expelled the country, and the most effectual means taken for preventing their return. The natives are for this purpose prohibited from going out of the country; and all foreigners are excluded from an open and free trade; for as to the Dutch and Chinese, under which last name some other eastern nations go thither, they are shut up whilst they remain there, and a most strict watch is set upon them, insomuch that they are no better than prisoners; and the Dutch, it is said, to obtain a privilege even so far, declared themselves *to be no Christians, but Dutchmen*. This calumny, however, Dr Kempfer has endeavoured to wipe off, but not altogether to satisfaction.

It was about the year of Christ 1549, or six years after the first discovery, that the fathers of the society arrived there, being induced by the favourable representations of a young Japanese who had fled to Goa. Till the year 1625, or near 1630, the Christian religion spread through most of the provinces of the empire, many of the princes and lords openly embracing it; and "there was very good reason to hope, that within a short compass of time the whole empire would have been converted to the faith of our Saviour, had not the ambitious views, and the impatient endeavours of the fathers to reap the temporal as well as the spiritual fruits of their care and labour, so provoked the supreme majesty of the empire as to raise against themselves and their converts a persecution which hath not its parallel

Japan.

in history, whereby the religion they preached, and all those that professed it, were in a few years time entirely exterminated."—The fathers had made a progress so great, that the princes of Bungu, Arima, and Omura who had been baptized, "sent, in the year 1582, some of their nearest relations, with letters and presents to pay homage to the then pope, Gregory XIII. and to assure his holiness of their filial submission to the church; an account of which most celebrated embassy hath been given in the works of that incomparable historian Thuanus, and by many other Roman catholic writers."

But notwithstanding this pleasing prospect, the emperor, anno 1586, issued proclamations for the suppression of the religion, and the persecution began. This, however, at first had not that effect which the government expected; for though, according to the letters of the Jesuits, 20,570 persons suffered death for the faith of Christ in the year 1590 only, yet in 1591 and 1592, when all the churches were actually shut up, they made 12,000 new converts. The business was finally concluded by the massacre at Simabara, about the year 1640. The reasons of the emperor's proclamations, making it death to embrace the religion, were as follow: 1. The new religion occasioned considerable alterations in the Japanese church, and was prejudicial in the highest degree to the heathen clergy. 2. It was feared the innovation in religion might be attended with fatal consequences even in regard to the sick; but what more immediately gave rise to them was, as the Japanese of credit confessed to Dr Kempfer, pride and covetousness; pride among the great ones, and covetousness in people of less note; the spiritual fathers aiming not only at the salvation of their souls, but having an eye also to their money and lands, and the merchants disposing of their goods in the most usurious and unreasonable manner. To confine ourselves to the clergy here: they "thought it beneath their dignity to walk on foot any longer; nothing would serve them but they must be carried about in stately chairs, mimicking the pomp of the pope and his cardinals at Rome. They not only put themselves on an equal footing with the greatest men of the empire, but, swelled with ecclesiastical pride, fancied that even a superior rank was nothing but their due. It one day happened, that a Portuguese bishop met upon the road one of the counsellors of state on his way to court. The haughty prelate would not order his chaise to be stopped, in order to alight and to pay his respects to the great man, as is usual in that country; but without taking any notice of him, nay, indeed without showing him so much as common marks of civility, he very contemptuously bid his men carry him by. The great man, exasperated at so signal an affront, thenceforward bore a mortal hatred to the Portuguese, and, in the height of his just resentment, made his complaint to the emperor himself, with such an odious picture of the insolence, pride, and vanity of this nation, as he expected could not but raise the emperor's utmost indignation." This happened in 1566. The next year the persecution began anew, and 26 persons, of the number whereof were two foreign Jesuits, and several other fathers of the Franciscan order, were executed on the cross. The emperor Jiojas had usurped the crown on his pupil Tidajori, who, as likewise the greater part of his court and party, had been either Christians them-

selves,

Japan. selves, or at least very favourably inclined to that religion; so the reasons of state mightily co-operated to forward the persecution.

Some Franciscan friars, whom the governor of the Manilla had sent as his ambassadors to the emperor of Japan, were guilty at this time of a most imprudent step: they, during the whole time of their abode in the country, preached openly in the street of Macao where they resided; and of their own accord built a church, contrary to the imperial commands, and contrary to the advice and earnest solicitations of the Jesuits.

Some time after, a discovery of a dangerous conspiracy, which the fathers, and the yet remaining adherents of their religion, entered into against the person of the emperor as a heathen prince, put a finishing stroke to the affair, and hastened the sentence which was pronounced soon after, *that the Portuguese should forever be banished the emperor's dominions*; for till then the state seemed desirous to spare the merchants and secular persons, for the purpose of continuing trade and commerce with them, which was looked upon as an affair independent of religion. The affair of the conspiracy was as follows: the Dutch had had an eye to the trade of Japan before 1600, and in 1611 had liberty of a free commerce granted them by the imperial letters patent, and had actually a factory at Firando. The Dutch were then at war with Spain, which was then sovereign of the Portuguese dominions; so that it was natural for them to be trying to supplant them. The Portuguese, on their parts, made use of all malicious inventions to blacken their characters, calling them rebels and pirates, whence it was natural for the Dutch to endeavour to clear, and even to revenge, themselves. Now they "took an homeward-bound Portuguese ship near the Cape of Good Hope, on board of which they found some traitorous letters to the king of Portugal, written by one Captain Moro, who was chief of the Portuguese in Japan, himself a Japanese by birth, and a great zealot for the Christian religion. The Dutch took special care to deliver the said letters to their protector the prince of Firando, who communicated them without loss of time to the governor of Nagasaki, a great friend to the Portuguese. Captain Moro having been taken up, boldly, and with great assurance, denied the fact, and so did all the Portuguese then at Nagasaki. However, neither the governor's favour, nor their constant denial, were able to clear them, and to keep off the cloud which was ready to break over their heads. Hand and seal convinced them; the letter was sent up to court, and Captain Moro sentenced to be burnt alive on a pale, which was executed accordingly. This letter laid open the whole plot which the Japanese Christians, in conjunction with the Portuguese, had laid against the emperor's life and throne; the want they stood in of ships and soldiers, which were promised them from Portugal; the names of the Japanese princes concerned in the conspiracy; and lastly, to crown all, the expectation of the papal blessing. This discovery made by the Dutch was afterwards confirmed by another letter written by the said Captain Moro to the Portuguese government at Macao, which was intercepted and brought to Japan by a Japanese ship."

Considering this, and the suspicions which the court had then already conceived against the Portuguese, it was no difficult matter thoroughly to ruin the little cre-

dit and favour they had as yet been able to preserve; and the rather, since the strict imperial orders notwithstanding, they did not leave off privately to bring over more ecclesiastics. Accordingly, in the year 1637, an imperial proclamation was sent to the governors of Nagasaki, with orders to see it put in execution. It was then that the empire of Japan was shut for ever both to foreigners and natives.

Now, although the governors of Nagasaki, on receipt of these commands, took care they should be obeyed, yet the directors of the Portuguese trade maintained themselves in Japan two years longer, hoping to obtain leave to stay in the island of Desima, and there to continue their trade. But they found themselves at last wholly disappointed; for the emperor was resolved to get rid of them; and on assurance given him by the Dutch East India company that they would supply for the future what commodities had been imported by the Portuguese, he declared the Portuguese and the Castilians, and whoever belonged to them, enemies of the empire, forbidding the importation of even the goods of their country, Spanish wines only excepted, for the use of the court. And thus the Portuguese lost their profitable trade and commerce with Japan, and were totally expelled the country before the latter end of the year 1639 or 1640; and thus ended the fruitless popish mission in this empire, for the Portuguese have never been able to restore themselves; and the Dutch have it not in their power to do any one thing in favour of religion, were they so inclined; but, as it appears, they are very indifferent as to that, and are in but little credit with the Japanese.

According to Dr Thunberg's researches, the Japanese have never been subdued by any foreign power, not even in the most remote periods; their chronicles contain such accounts of their valour, as one would rather incline to consider as fabulous inventions than actual occurrences, if later ages had not furnished equally striking proofs of it. When the Tartars, for the first time in 790, had overrun part of Japan, and when, after a considerable time had elapsed, their fleet was destroyed by a violent storm in the course of a single night, the Japanese general attacked, and so totally defeated his numerous and brave enemies, that not a single person survived to return and carry the tidings of such an unparalleled defeat. In like manner, when the Japanese were again, in 1281, invaded by the warlike Tartars, to the number of 240,000 fighting men, they gained a victory equally complete. The extirpation of the Portuguese, and with them of the Christian religion, towards the beginning of the 17th century, as already mentioned, was so complete, that scarce a vestige can now be discerned of its ever having existed there.

With respect to the government of these islands, it is and has been for a long time monarchical; though formerly it seems to have been split into a great number of petty kingdoms, which were at length all swallowed by one. The imperial dignity had been enjoyed for a considerable time before the year 1500, by a regular succession of princes, under the title of *dairōs*, a name supposed to have been derived from Dairo the head of that family. Soon after that epoch, such a dreadful civil war broke out, and lasted so many years, that the empire was quite ruined. During these distractions and confusions, a common fol-

Japan.

dier, by name Tayckoy, a person of obscure birth, but of an enterprising genius, found means to raise himself to the imperial dignity; having, in little more than three years time, by an uncommon share of good fortune, subdued all his competitors and opponents and reduced all their cities and castles. The daïro not being in a condition to obstruct or put a stop to his progress, was forced to submit to his terms; and might perhaps have been condemned to much harder, had not Tayckoy been apprehensive lest his soldiers, who still revered their ancient natural monarch, should have revolted in his favour. To prevent this, he granted him the supreme power in all religious matters, with great privileges, honours, and revenues annexed to it; whilst himself remained invested with the whole civil and military power, and was acknowledged and proclaimed king of Japan. This great revolution happened in 1517, and Tayckoy reigned several years with great wisdom and tranquillity; during which he made many wholesome laws and regulations, which still subsist, and are much admired to this day. At his death, he left the crown to his son Tayckofama, then a minor; but the treacherous prince under whose guardianship he was left deprived him of his life before he came of age. By this murder, the crown passed to the family of Jeassama, in which it still continues. Tayckoy and his successors have contented themselves with the title of *cubo*, which, under the daïros, was that of prime minister, whose office is now suppressed; so that the *cubo*, in all secular concerns, is quite as absolute and despotic, and has as extensive a power over the lives and fortunes of all his subjects, from the petty kings down to the lowest persons, as ever the daïros had. The daïro resides constantly at Meaco, and the *cubo* at Jeddo.

The inhabitants of Japan are well-grown, agile, and active, and at the same time stout-limbed, though they do not equal in strength the northern inhabitants of Europe. The colour of the face is commonly yellow; which sometimes varies to brown, and sometimes to white. The inferior sort, who during their work in summer have often the upper parts of the body naked, are sun-burnt and browner; women of distinction, who never go uncovered into the open air, are perfectly white.

The national character, consists in intelligence and prudence, frankness, obedience, and politeness, good-nature and civility, curiosity, industry, and dexterity, economy and sobriety, hardness, cleanliness, justice and uprightnes, honesty and fidelity; in being also mistrustful, superstitious, haughty, resentful, brave and invincible.

In all its transactions, the nation shows great intelligence, and can by no means be numbered among the savage and uncivilized, but rather is to be placed among the polished. The present mode of government, admirable skill in agriculture, sparing mode of life, way of trading with foreigners, manufactures, &c. afford convincing proofs of their cunning, firmness, and intrepid courage. Here there are no appearances of that vanity so common among the Asiatics and Africans, of adorning themselves with shells, glass-beads, and polished metal plates: neither are they fond of the useless European ornaments of gold and silver lace, jewels, &c. but are careful to provide themselves, from

the productions of their own country, with neat clothes, well-tasted food, and good weapons.

Japan.

Their curiosity is excessive; nothing imported by the Europeans escapes it. They ask for information concerning every article, and their questions continue till they become wearisome. It is the physician, among the traders, that is alone regarded as learned, and particularly during the journey to court and the residence at Jeddo, the capital of the empire, that he is regarded as the oracle, which they trust can give responses in all things, whether in mathematics, geography, physics, chemistry, pharmacy, zoology, botany, medicine, &c.

Economy has its peculiar abode in Japan. It is a virtue admired as well in the emperor's palace as in the meanest cottage. It makes those of small possessions content with their little, and it prevents the abundance of the rich from overflowing in excess and voluptuousness. Hence it happens, that what in other countries is called scarcity and famine, is unknown here; and that, in so very populous a state, scarce a person in necessity, or a beggar, should be found.

The names of families, and of single persons, are under very different regulations from ours. The family name is never changed, but is never used in ordinary conversation, and only when they sign some writing; to which they also for the most part affix their seal. There is also this peculiarity, that the surname is always placed first; just as in botanical books the generic name is always placed before the specific name. The prænomen is always used in addressing a person; and it is changed several times in the course of life. A child receives at birth from its parents a name, which is retained till it has itself a son arrived at maturity. A person again changes his name when he is invested with any office; as also when he is advanced to a higher trust: some, as emperors and princes, acquire a new name after death. The names of women are less variable; they are in general borrowed from the most beautiful flowers.

After marriage, the wife is confined to her own apartment, from whence she hardly ever stirs, except once a-year to the funeral-rites of her family; nor is she permitted to see any man, except perhaps some very near relation, and that as seldom as can be. The wives, as well as in China and other parts of the east, bring no portion with them, but are rather bought by the husband of their parents and relations. The bridegroom most commonly sees his bride for the first time upon her being brought to his house from the place of the nuptial ceremony: for in the temple where it is performed she is covered over with a veil, which reaches from the head to the feet. A husband can put his wives to a more or less severe death, if they give him the least cause of jealousy, by being seen barely to converse with another man, or suffering one to come into their apartment.

The dress of the Japanese deserves, more than that of any other people, the name of national; since they are not only different from that of all other men, but are also of the same form in all ranks, from the monarch to his meanest subject, as well as in both sexes; and what exceeds all credibility, they have not been altered for at least 2444 years. They universally consist of night-gowns, made long and wide, of which several

veral

veral are worn at once by all ranks and all ages. The more distinguished and the rich have them of the finest silk; the poorer sort of cotton. Those of the women reach down to the ground, and sometimes have a train; in the men, they reach down to the heels: travellers, soldiers, and labourers, either tuck them up, or wear them only down to the knees. The habit of the men is generally of one colour; the women have theirs variegated and frequently with flowers of gold interwoven. In summer, they are either without lining, or have but a thin one; in winter they are stuffed to a great thickness with cotton or silk. The men seldom wear a great number; but the women thirty, fifty, or more, all so thin, that they scarce together amount to five pounds. The undermost serves for a shirt, and is therefore either white or blue, and for the most part thin and transparent. All these gowns are fastened round the waist with a belt, which in the men are about a hand's-breadth, in the women about a foot; of such a length that they go twice round the waist, and afterwards are tied in a knot with many ends and bows. The knot, particularly among the fair sex, is very conspicuous, and immediately informs the spectator whether they are married or not. The unmarried have it behind, on their back; the married before. In this belt the men fix their pipes, fans, pipe, tobacco, and medicine boxes. In the neck the gowns are always cut round, without a collar; they therefore leave the neck bare; nor is it covered with cravat, cloth, or any thing else. The sleeves are always ill made, and out of all proportion wide: at the opening before, they are half sewed up, so that they form a sack, in which the hands can be put in cold weather; they also serve for a pocket. Girls in particular have their sleeves so long that they reach down to the ground. Such is the simplicity of their habit, that they are soon dressed; and to undress, they need only open their girdle and draw in their arms.

As the gowns, from their length, keep the thighs and legs warm, there is no occasion for stockings; nor do they use them in all the empire. Among poorer persons on a journey, and among soldiers, who have not such long gowns, one sees buskins of cotton. Shoes, or, more properly speaking, slippers, are of all that is worn by the Japanese, the simplest, the meanest, and the most miserable, though in general use among high and low, rich and poor. They are made of interwoven rice-straw; and sometimes, for persons of distinction, of reeds split very thin. They consist only of a sole, without upper leathers or quarters. Before, there passes over, transversely, a bow of linen, of a finger's breadth: from the point of the shoe to this bow goes a thin round band, which running within the great toe, serves to keep the shoe fixed to the foot. The shoe being without quarters, slides, during walking, like a slipper. Travellers have three bands of twisted straw, by which they fasten the shoe to the foot and leg, to prevent its falling off. The Japanese never enter their houses with shoes, but put them off in the entrance. This precaution is taken for the sake of their neat carpets. During the time the Dutch reside in Japan, as they have sometimes occasion to pay the natives visits in their houses, and as they have their own apartment at the factory covered with the same sort of carpets, they do not wear European shoes, but have in

their stead red, green, or black slippers, which can easily be put off at entering in. They, however, wear stockings, with shoes of cotton, fastened by buckles. These shoes are made in Japan, and may be washed whenever they become dirty.

The way of dressing the hair is not less peculiar to this people, and less universally prevalent among them, than the use of their long gowns. The men shave the head from the forehead to the neck; and the hair remaining on the temples, and in the nape, is well besmeared with oil, turned upwards, and then tied with a white paper thread, which is wrapped round several times. The ends of the hair beyond the head, are cut cross-ways, about a finger's length being left. This part, after being pasted together with oil, is bent in such a manner that the point is brought to the crown of the head; in which situation it is fixed by passing the same thread round it once. Women, except such as happen to be separated from their husbands, shave no part of their head.

The head is never covered with hat or bonnet in winter or in summer, except when they are on a journey; and then they use a conical hat, made of a sort of grass, and fixed with a ribband. Some travelling women, who are met with on the roads, have a bonnet like a shaving basin inverted on the head, which is made of cloth, in which gold is interwoven. On other occasions, their naked heads are preserved, both from rain and the sun, by umbrellas. Travellers, moreover, have a sort of riding-coat, made of thick paper oiled. They are worn by the upper servants of princes, and the suite of other travellers. Dr Thunberg and his fellow-travellers, during their journey to court, were obliged to provide such for their attendants when they passed through the place where they are made.

A Japanese always has his arms painted on one or more of his garments, especially on the long and short gowns, on the sleeves, or between the shoulders; so that nobody can steal them; which otherwise might easily happen in a country where the clothes are so much alike in stuff, shape, and size.

The weapons of the Japanese consist of a bow and arrows, sabre, halbert, and musket. The bows are very large, and the arrows long, as in China. When the bows are to be bent and discharged, the troop always rests on one knee, which hinders them making a speedy discharge. In the spring the troops assemble to practise shooting at a mark. Muskets are not general; Dr Thunberg only saw them in the hands of persons of distinction, in a separated and elevated part of the audience room. The barrel is of the common length; but the stock is very short, and there is a match in the lock. The sabre is their principal and best weapon, which is universally worn, except by the peasants. They are commonly a yard long, a little crooked, and thick in the back. The blades are of an incomparable goodness, and the old ones are in very high esteem. They are far superior to the Spanish blades so celebrated in Europe. A tolerably thick nail is easily cut in two without any damage to the edge; and a man, according to the account of the Japanese, may be cleft asunder. A separate sash is never used, but the sword is stuck in the belt, on the left side, with the edge upwards, which to a European appears ridiculous. All persons in office wear two such sabres, one of their own, and

Japan.

and the other the *sword of office*, as it is called; the latter is always the longer. Both are worn in the belt on the same side, and so disposed as to cross each other. When they are sitting, they have their sword of office laid on one side or before them.

The sciences are very far from having arrived at the same height in Japan as in Europe. The history of the country is, notwithstanding, more authentic, perhaps, than that of any other country; and it is studied, without distinction, by all. Agriculture, which is considered as the art most necessary, and most conducive to the support and prosperity of the kingdom, is nowhere in the world brought to such perfection as here; where neither civil nor foreign war, nor emigration, diminishes population; and where a thought is never entertained, either of getting possession of other countries, or to import the useless and often hurtful productions of foreign lands; but where the utmost care is taken that no turf lies uncultivated, and no produce of the earth unemployed. Astronomy is pursued and respected; but the natives are unable, without the aid of Chinese, and sometimes of Dutch almanacks, to form a true calendar, or calculate an eclipse of the sun or moon within minutes and seconds. Medicine has neither arrived, nor is it likely to arrive, at any degree of perfection. Anatomy is totally unknown; and the knowledge of diseases imperfect, intricate, and often fabulous. Botany, and the knowledge of medicines, constitute the whole of their skill. They use only simples; and these generally in diuretic and diaphoretic decoctions. They are unacquainted with compound medicines. Their physicians always indeed feel the pulse; but they are very tedious, not quitting it for a quarter of an hour; besides, they examine first one, and then the other arm, as if the blood was not driven by the same heart to both pulses. Besides those diseases which they have in common with other countries, or peculiar to themselves, the venereal disease is very frequent, which they only understood how to alleviate by decoctions, thought to purify the blood. Salivation, which their physicians have heard mentioned by the Dutch surgeons, appears to them extremely formidable, both to conduct and to undergo; but they have lately learned the art of employing the sublimate with much success.—Jurisprudence is not an extensive study in Japan. No country has thinner law-books, or fewer judges. Explanations of the law, and advocates, are things altogether unknown; but nowhere, perhaps, are the laws more certainly put in force, without respect to persons, without partiality or violence. They are very strict, and lawsuits very short. The Japanese know little more of physics or chemistry than what they have learned of late years of the Europeans.

Their computation of time takes its rise from *Min-o*, or 660 years before Christ. The year is divided according to the changes of the moon; so that some years consist of twelve, and others of thirteen, months; and the beginning of the year falls out in February or March. They have no weeks consisting of seven days, or of six working days, and a holiday; but the first and fifteenth days of the month serve for holidays. On these days no work is done. On new-year's-day they go round to visit one another a new-year, with their whole families, clad in white and blue chequered, their holiday-dress; and they rest almost the whole of the

first month. The day is divided only into twelve hours; and in this division they are directed the whole year by the rising and setting of the sun. They reckon six o'clock at the rising, and six likewise at the setting of the sun. Mid-day and mid-night are always at nine. Time is not measured by clocks or hour-glasses, but with burning matches, which are twisted together like ropes, and divided by knots. When the match is burnt to a knot, which indicates a certain portion of time elapsed, notice is given during the day, by striking the bells of the temples; and in the night, by the watchmen striking two boards against one another. A child is always reckoned a year old at the end of the year of his birth, whether this happen at the beginning or the close. A few days after the beginning of the year, is performed the horrid ceremony of trampling on images representing the cross and the Virgin Mary with her child. The images are of melted copper, and are said to be scarce a foot in height. This ceremony is intended to impress every individual with hatred of the Christian doctrine, and the Portuguese, who attempted to introduce it there; and also to discover whether there is any remnant of it left among the Japanese. It is performed in the places where the Christians chiefly resided. In Nagasaki it lasts four days; then the images are conveyed to the circumjacent places, and afterwards are laid aside against the next year. Every person, except the Japanese governor and his attendants, even the smallest child, must be present; but it is not true, as some have pretended, that the Dutch are also obliged to trample on the image. Overseers are appointed in every place, who assemble the people in companies in certain houses, call over the name of every one in his turn, and take care that every thing goes on properly. The children, not yet able to walk, have their feet placed upon it; older persons pass over it from one side of the room to the other.

The Japanese are much addicted to poetry, music, and painting: the first is said to be grand as to the style and imagery, softness, and cadence; but, like that of the Chinese, is not easily understood or relished by the Europeans. The same may be said of their music, both vocal and instrumental; the best of which, of either kind, would hardly be tolerable to a nice European ear.

They pretend, like the Chinese, to have been the inventors of printing from time immemorial, and their method is the same with theirs on wooden blocks; but they excel them in the neatness of cutting them, as well as in the goodness of their ink and paper. They likewise lay claim to the invention of gunpowder; and are vastly superior to the Chinese in the use of all sorts of fire-arms, especially of artillery, as well as the curiousness of their fire-works.

Their manner of writing is much the same as that of the Chinese, viz. in columns from top to bottom, and the columns beginning at the right and ending at the left hand. Their characters were also originally the same, but now differ considerably.

Their language hath some affinity with the Chinese, though it appears from its various dialects to have been a kind of compound of that and other languages, derived from the various nations that first peopled those islands. It is not only very regular, polite, elegant, and copious, but abounds with a great variety of synonyms,

Japan.

Japan.

nonyma, adapted to the nature of the subject they are upon, whether sublime, familiar, or low; and to the quality, age, and sex, both of the speaker and person spoken.

The Japanese are commonly very ingenious in most handicraft trades; and excel even the Chinese in several manufactures, particularly in the beauty, goodness, and variety of their silks, cottons, and other stuffs, and in their Japan and porcelain wares. No eastern nation comes up to them in the tempering and fabricating of scimitars, swords, muskets, and other such weapons.

The Japanese architecture is much in the same taste and style as that of the Chinese, especially as to their temples, palaces, and other public buildings; but in private ones they affect more plainness and neatness than show. These last are of wood and cement, consisting of two stories: they dwell only in the lower; the upper chamber serving for wardrobes. The roofs are covered with rush-mats three or four inches thick. In every house there is a small court, ornamented with trees, shrubs, and flower-pots; as likewise with a place for bathing. Chimneys are unknown in this country, although fire is needed from the cold month of October till the end of March. They heat their rooms with charcoal contained in a copper stove, which they sit round. Their cities are generally spacious, having each a prince or governor residing in them. The capital of Jeddo is 21 French leagues in circumference. Its streets are straight and large. There are gates at little distances, with an extremely high ladder, which they ascend to discover fires. Villages differ from cities in having but one street; which often extends several leagues. Some of them are situated so near each other, that they are only separated by a river or a bridge. The principal furniture of the Japanese consists in straw-mats, which serve them for seats and beds; a small table for every one who chooses to eat is the only moveable. The Japanese sit always upon their hams. Before dinner begins, they make a profound bow and drink to the health of the guests. The women eat by themselves. During the courses, they drink a glass of sakki, which is a kind of beer made of rice kept constantly warm; and they drink at each new morsel. Tea and sakki are the most favourite drink of this people; wine and spirits are never used, nor even accepted when offered by the Dutch. Sakki, or rice beer, is clear as wine, and of an agreeable taste: taken in quantity, it intoxicates for a few moments, and causes headach. Both men and women are fond of tobacco, which is in universal vogue and smoked continually. The gardens about their houses are adorned with a variety of flowers, trees, verdure, baths, terraces, and other embellishments. The furniture and decorations of the houses of persons of distinction consist in japan-work of various colours, curious paintings, beds, couches, screens, cabinets, tables, a variety of porcelain jars, vases, tea-equipage, and other vessels and figures, together with swords, guns, scimitars, and other arms. Their retinues are more or less numerous and splendid according to their rank; but there are few of the lords who have less than 50 or 60 men richly clad and armed, some on foot, but most on horseback. As for their petty kings and princes, they are seldom seen without 300 or 200 at

least, when they either wait on the emperor, which is one-half of the year, or attend him abroad.

When a prince or great man dies, there are commonly about 10, 20, or more youths of his household, and such as were his greatest favourites, who put themselves to a voluntary death, at the place where the body is buried or burned: as soon as the funeral pile, consisting of odoriferous woods, gums, spices, oils, and other ingredients, is set on fire, the relations and friends of the deceased throw their presents into it, such as clothes, arms, victuals, money, sweet herbs, flowers, and other things which they imagine will be of use to him in the other world. Those of the middle or lower rank commonly bury their dead, without any other burning than that of some odoriferous woods, gums, &c. The sepulchres in which the bones and ashes of persons of rank are deposited, are generally very magnificent, and situated at some distance from the towns.

The Dutch and Chinese are the only nations allowed to traffic in Japan. The Dutch at present send but two ships annually, which are fitted out at Batavia, and sail in June, and return at the end of the year. The chief merchandize is Japanese copper and raw camphor. The wares which the Dutch company import are, coarse sugar, ivory, a great quantity of tin and lead, a little cast iron, various kinds of fine chintzes, Dutch cloth of different colours and fineness, serge wood for dyeing, tortoise-shell, and *costus Arabicus*. The little merchandize brought by the officers on their own account, consists of saffron, theriaca, sealing-wax, glass-beads, watches, &c. &c. About the time when the Dutch ships are expected, several outposts are stationed on the highest hills by the government; they are provided with telescopes, and long before their arrival give the governor of Nagasaki notice. As soon as they anchor in the harbour, the upper and under officers of the Japanese immediately betake themselves on board, together with interpreters; to whom is delivered a chest, in which all the sailors books, the muster-roll of the whole crew, six small barrels of powder, six barrels of balls, six muskets, six bayonets, six pistols, and six swords are deposited; this is supposed to be the whole remaining ammunition after the imperial garrison has been saluted. These things are conveyed on shore, and preserved in a separate warehouse, nor are they returned before the day the ship quits the harbour.

Duties are quite unknown as well in the inland part as on the coast, nor are there any customs required either for exported or imported goods; an advantage enjoyed by few nations. But, to prevent the importation of any forbidden wares, the utmost vigilance is observed; then the men and things are examined with the eyes of Argus. When any European goes on shore, he is examined before he leaves the ship, and afterwards on his landing. This double search is exceedingly strict; so that not only the pockets and clothes are stroaked with the hands, but the pudenda of the meaner sort are pressed, and the hair of the slaves. All the Japanese who come on board are searched in like manner, except only their superior officers: so also are the wares either exported or imported, first on board, and then at the factory, except the great chests, which are opened at the factory, and so carefully examined that they

Japan.

Japan.
Japanning.

they strike the very sides lest they should be hollow. The bed-clothes are often opened, and the feathers examined: rods of iron are run into the pots of butter and confections: a square hole is made in the cheese, and a long pointed iron is thrust into it in all directions. Their suspicion is carried so far, that they take out and break one or two of the eggs brought from Bavia.

The interpreters are all natives; they speak Dutch in different degrees of purity. The government permits no foreigner to learn their language, lest they should by means of this acquire the knowledge of the manufactures of the country; but 40 or 50 interpreters are provided to serve the Dutch in their trade, or on any other occasion.

The interpreters are very inquisitive after European books, and generally provide themselves with some from the Dutch merchants. They peruse them with care, and remember what they learn. They besides endeavour to get instruction from the Europeans; for which purpose they ask numberless questions, particularly respecting medicine, physics, and natural history. Most of them apply to medicine, and are the only physicians of their nation who practise in the European manner, and with European medicines, which they procure from the Dutch physicians. Hence they are able to acquire money, and to make themselves respected.

Among the vegetable productions peculiar to Japan, we may take notice of the *alertris japonica*, *camellia japonica*, and the *volkameria japonica*. The trumpet-flower, or *bignonia catalpa* of Linnæus, is very common, bearing a resemblance to the *epidendrum vanilla*, the berries of which are said to constitute an article of commerce. Here also we find the *mimosa arborea*, and tallow tree, together with the plantain, cocoa-nut tree, the *chamarops excelsa*, and the *cycas circinalis*, adorning the woods near the sea shore.

It is a singular circumstance, that in the whole empire of Japan, neither sheep nor goats are to be met with, the goats being deemed pernicious to cultivation; and the vast quantities of silk and cotton with which it abounds, are considered as an excellent substitute for wool. There are few quadrupeds of any kind, either swine, horses, or cattle, as the Japanese live upon fish, poultry, and vegetables. Some wolves are seen in the northern provinces; and foxes are considered as demons incarnate.

Gold and silver abound in Japan, and copper richly impregnated with gold, which constitutes the chief wealth of many provinces. Iron is said to be scarcer than any other metal, which of consequence they are not fond of exporting. Amber, sulphur, pit-coal, red agate, asbestos, porcelain, clay, pumice and white marble, are also found in considerable quantities; but, according to Kämpfer, neither antimony nor mercury. As Europeans have seldom visited the interior parts of the country, the natural curiosities of Japan are but very little known.

JAPAN Earth. See MIMOSA and TERRA JAPONICA, MATERIA MEDICA Index.

JAPANNING, the art of varnishing and drawing figures on wood, in the same manner as is done by the natives of Japan in the East Indies.

The substances which admit of being japanned are

almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper prepared.

Wood and metals do not require any other preparation, but to have their surface perfectly even and clean: but leather should be securely strained either on frames or on boards; as its bending or forming folds would otherwise crack and force off the coats of varnish: and paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning till it is converted into *papier machè*, or wrought by other means into such form, that its original state, particularly with respect to flexibility, is lost.

One principal variation from the method formerly used in japanning is, the using or omitting any priming or undercoat on the work to be japanned. In the older practice, such priming was always used; and is at present retained in the French manner of japanning coaches and snuff-boxes of the *papier machè*; but in the Birmingham manufacture here, it has been always rejected. The advantage of using such priming or undercoat is, that it makes a saving in the quantity of varnish used; because the matter of which the priming is composed fills up the inequalities of the body to be varnished; and makes it easy, by means of rubbing and water-polishing, to gain an even surface for the varnish: and this was therefore such a convenience in the case of wood, as the giving a hardness and firmness to the ground was also in the case of leather, that it became an established method; and is therefore retained even in the instance of the *papier machè* by the French, who applied the received method of japanning to that kind of work on its introduction. There is nevertheless this inconvenience always attending the use of an undercoat of size, that the japan coats of varnish and colour will be constantly liable to be cracked and peeled off by any violence, and will not endure near so long as the bodies japanned in the same manner, but without any such priming; as may be easily observed in comparing the wear of the Paris and Birmingham snuff-boxes; which latter, when good of their kind, never peel or crack, or suffer any damage, unless by great violence, and such a continued rubbing as wastes away the substance of the varnish; while the japan coats of the Parisians crack and fly off in flakes, whenever any knock or fall, particularly near the edges, expose them to be injured. But the Birmingham manufacturers, who originally practised the japanning only on metals, to which the reason above given for the use of priming did not extend, and who took up this art of themselves as an invention, of course omitted at first the use of any such undercoat; and not finding it more necessary in the instance of *papier machè* than on metals, continue still to reject it. On which account, the boxes of their manufacture are, with regard to the wear, greatly better than the French.

The laying on the colours in gum-water, instead of varnish, is also another variation from the method of japanning formerly practised: but the much greater strength of the work, where they are laid on in varnish or oil, has occasioned this way to be exploded with the greatest reason in all regular manufactures: however, they who may practise japanning on cabinets, or other such pieces as are not exposed to much wear and violence,

Japanning. violence, for their amusement only, and consequently may not find it worth their while to encumber themselves with the preparations necessary for the other methods, may paint with water-colours on an undercoat laid on the wood or other substance of which the piece to be japanned is formed; and then finished with the proper coats of varnish, according to the methods below taught: and if the colours are tempered with the strongest isinglass size and honey, instead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will last as long as the old japan.

Of JAPAN Grounds.—The proper grounds are either such as are formed by the varnish and colour, where the whole is to remain of one simple colour; or by the varnish either coloured or without colour, on which some painting or other decoration is afterwards to be laid. It is necessary, however, before we proceed to speak of the particular grounds, to show the manner of laying on the priming or undercoat, where any such is used.

This priming is of the same nature with that called *clear-coating*, or vulgarly *clear-coaling*, practised erroneously by the house-painters; and consists only in laying on and drying in the moist even manner a composition of size and whitening, or sometimes lime instead of the latter. The common size has been generally used for this purpose: but where the work is of a nicer kind, it is better to employ the gloves or the parchment size; and if a third of isinglass be added, it will be still better, and, if not laid on too thick, much less liable to peel and crack. The work should be prepared by this priming, by being well smoothed with the fish-skin or glass-haver; and, being made thoroughly clean, should be brushed over once or twice with hot size, diluted with two-thirds of water, if it be of the common strength. The priming should then be laid on with a brush as even as possible; and should be formed of a size whose consistence is betwixt the common kind and glue, mixed with as much whitening as will give it a sufficient body of colour to hide the surface of whatever it is laid upon, but not more.

If the surface be very clean on which the priming is used, two coats of it laid on in this manner will be sufficient; but if, on trial with a fine wet rag, it will not receive a proper water polish on account of any inequalities not sufficiently filled up and covered, two or more coats must be given it: and whether a greater or less number be used, the work should be smoothed, after the last coat but one is dry, by rubbing it with the Dutch rushes. When the last coat is dry, the water polish should be given, by passing over every part of it with a fine rag gently moistened, till the whole appear perfectly plain and even. The priming will then be completed, and the work ready to receive the painting or coloured varnish; the rest of the proceedings being the same in this case as where no priming is used.

When wood or leather is to be japanned, and no priming is used, the best preparation is to lay two or three coats of coarse varnish composed in the following manner:

“Take of rectified spirit of wine one pint, and of

coarse seed-lac and resin each two ounces. Dissolve the *Japanning.* seed-lac and resin in the spirit; and then strain off the varnish.”

This varnish, as well as all others formed of spirit of wine, must be laid on in a warm place; and, if it can be conveniently managed, the piece of work to be varnished should be made warm likewise: and for the same reason all dampness should be avoided; for either cold or moisture chills this kind of varnish, and prevents it taking proper hold of the substance on which it is laid.

When the work is so prepared, or by the priming with the composition of size and whitening above described, the proper japan ground must be laid on, which is much the best formed of shell-lac varnish, and the colour desired, if white be not in question, which demands a peculiar treatment, or great brightness be not required, when also other means must be pursued.

The colours used with the shell-lac varnish may be any pigments whatever which give the tint of the ground desired; and they may be mixed together to form browns or any compound colours.

As metals never require to be undercoated with whitening, they may be treated in the same manner as wood or leather, when the undercoat is omitted, except in the instances particularly spoken of below.

White JAPAN Grounds.—The forming a ground perfectly white, and of the first degree of hardness, remains hitherto a desideratum, or matter sought for, in the art of japanning, as there are no substances which form a very hard varnish but what have too much colour not to deprive the whiteness, when laid on of a due thickness over the work.

The nearest approach, however, to a perfect white varnish, already known, is made by the following composition.

“Take flake white, or white lead, washed over and ground up with a sixth of its weight of starch, and then dried; and temper it properly for spreading with the mastich varnish prepared as under the article *VAR-NISH*.”

“Lay these on the body to be japanned, prepared either with or without the undercoat of whitening, in the manner as above ordered; and then varnish it over with five or six coats of the following varnish:

“Provide any quantity of the best seed-lac; and pick out of it all the clearest and whitest grains, reserving the more coloured and fouler parts for the coarse varnishes, such as that used for priming or preparing wood or leather. Take of this picked seed-lac two ounces, and of gum-animi three ounces; and dissolve them, being previously reduced to a gross powder, in about a quart of spirit of wine; and strain off the clear varnish.”

The seed-lac will yet give a slight tinge to this composition; but cannot be omitted where the varnish is wanted to be hard; though, when a softer will answer the end, the proportion may be diminished, and a little crude turpentine added to the gum animi to take off the brittleness.

A very good varnish, free entirely from all brittleness, may be formed by dissolving as much gum-animi as the oil will take, in old nut or poppy oil; which must be made to boil gently when the gum is put into it. The

Japanning. ground of white colour itself may be laid on in this varnish, and then a coat or two of it may be put over the ground; but it must be well diluted with oil of turpentine when it is used. This, though free from brittleness, is nevertheless liable to suffer by being indented or bruised by any slight strokes; and it will not well bear any polish, but may be brought to a very smooth surface without, if it be judiciously managed in the laying it on. It is likewise somewhat tedious in drying, and will require some time where several coats are laid on; as the last ought not to contain much oil of turpentine.

Blue JAPAN Grounds.—Blue japan grounds may be formed of bright Prussian blue, or of verditer glazed over by Prussian blue, or of smalt. The colour may be best mixed with shell-lac varnish, and brought to a polishing state by five or six coats of varnish of seed-lac: but the varnish, nevertheless, will somewhat injure the colour by giving to a true blue a cast of green, and fouling in some degree a warm blue by the yellow it contains: where, therefore, a bright blue is required, and a less degree of hardness can be dispensed with, the method before directed in the case of white grounds must be pursued.

Red JAPAN Grounds.—For a scarlet japan ground, vermilion may be used: but the vermilion has a glaring effect, that renders it much less beautiful than the crimson produced by glazing it over with carmine or fine lake: or even with rose-pink, which has a very good effect used for this purpose. For a very bright crimson, nevertheless, instead of glazing with carmine, the Indian lake should be used, dissolved in the spirit of which the varnish is compounded, which it readily admits of when good: and, in this case, instead of glazing with the shell-lac varnish, the upper or polishing coats need only be used; as they will equally receive and convey the tinge of the Indian lake, which may be actually dissolved by spirit of wine: and this will be found a much cheaper method than the using carmine. If, nevertheless, the highest degree of brightness be required, the white varnishes must be used.

Yellow JAPAN Grounds.—For bright yellow grounds, the king's yellow, or the turpeth mineral, should be employed, either alone or mixed with fine Dutch pink: and the effect may be still more heightened by dissolving powdered turmeric root in the spirit of wine of which the upper or polishing coat is made; which spirit of wine must be strained from off the dregs before the seed-lac be added to it to form the varnish.

The seed-lac varnish is not equally injurious here, and with greens, as in the case of other colours; because, being only tinged with a reddish yellow, it is little more than an addition to the force of the colours.

Yellow grounds may be likewise formed of the Dutch pink only; which, when good, will not be wanting in brightness, though extremely cheap.

Green JAPAN Grounds.—Green grounds may be produced by mixing the king's yellow and bright Prussian blue, or rather the turpeth mineral and Prussian blue; and a cheap, but fouler kind, by verdegriis with a little of the above-mentioned yellows, or Dutch pink. But, where a very bright green is wanted, the crystals of verdegriis, called *distilled verdegriis*, should be employed; and to heighten the effect, they should be laid on a

ground of leaf-gold, which renders the colour extremely brilliant and pleasing.

They may any of them be used successfully with good seed-lac varnish, for the reason before given; but will be still brighter with white varnish.

Orange-coloured JAPAN Grounds.—Orange-coloured japan grounds may be formed by mixing vermilion or red-lead with king's yellow, or Dutch pink; or the orange-lac, which will make a brighter orange ground than can be produced by any mixture.

Purple JAPAN Grounds.—Purple japan grounds may be produced by the mixture of lake and Prussian blue; or a fouler kind, by vermilion and Prussian blue. They may be treated as the rest with respect to the varnish.

Black JAPAN Grounds to be produced with Heat.—Black grounds may be formed by either ivory-black or lamp black: but the former is preferable where it is perfectly good.

These may be always laid on with shell-lac varnish; and have their upper or polishing coats of common seed-lac varnish, as the tinge or fulness of the varnish can be here no injury.

Common Black JAPAN Grounds on Iron or Copper, produced by means of Heat.—For forming the common black japan grounds by means of heat, the piece of work to be japanned must be painted over with drying oil; and, when it is of a moderate dryness, must be put into a stove of such degree of heat as will change the oil to black, without burning it so as to destroy or weaken its tenacity. The stove should not be too hot when the work is put into it, nor the heat increased too fast; either of which errors would make it blister: but the slower the heat is augmented, and the longer it is continued, provided it be restrained within the due degree, the harder will be the coat of japan.—This kind of varnish requires no polish, having received, when properly managed, a sufficient one from the heat.

The fine Tortoise-shell JAPAN Ground produced by means of Heat.—The best kind of tortoise-shell ground produced by heat is not less valuable for its great hardness, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varnish prepared in the following manner:

“Take of good linseed oil one gallon, and of umbre half a pound: boil them together till the oil become very brown and thick: strain it then through a coarse cloth, and set it again to boil; in which state it must be continued till it acquire a pitchy consistence; when it will be fit for use.”

Having prepared thus the varnish, clean well the iron or copper plate or other piece which is to be japanned; and then lay vermilion tempered with shell-lac varnish, or with drying oil diluted with oil of turpentine, very thinly, on the places intended to imitate the more transparent parts of the tortoise-shell. When the vermilion is dry, brush over the whole with the black varnish, tempered to a due consistence with oil of turpentine; and when it is set and firm, put the work into a stove, where it may undergo a very strong heat, and must be continued a considerable time; if even three weeks or a month, it will be the better.

Japanning. This was given amongst other receipts by Kunckel ; but appears to have been neglected till it was revived with great success in the Birmingham manufactures, where it was not only the ground of snuff-boxes, dressing-boxes, and other such lesser pieces, but of those beautiful tea-waiters which have been so justly esteemed and admired in several parts of Europe where they have been sent. This ground may be decorated with painting and gilding, in the same manner as any other varnished surface, which had best be done after the ground has been duly hardened by the hot stove ; but it is well to give a second annealing with a more gentle heat after it is finished.

Method of Painting JAPAN Work.—Japan work ought properly to be painted with colours in varnish, though, in order for the greater dispatch, and, in some very nice works in small, for the freer use of the pencil, the colours are sometimes tempered in oil ; which should previously have a fourth part of its weight of gum-animi dissolved in it ; or, in default of that, of the gums sandarac or mastic. When the oil is thus used, it should be well diluted with spirit of turpentine, that the colours may be laid more evenly and thin ; by which means, fewer of the polishing or upper coats of varnish become necessary.

In some instances, water-colours are laid on grounds of gold, in the manner of other paintings ; and are best, when so used, in their proper appearance, without any varnish over them ; and they are also sometimes so managed as to have the effect of embossed work. The colours employed in this way, for painting, are both prepared by means of isinglass size corrected with honey or sugarcandy. The body of which the embossed work is raised, need not, however, be tinged with the exterior colour ; but may be best formed of very strong gum-water, thickened to a proper consistence by bole-armenian and whiting in equal parts ; which being laid on the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the isinglass size, or in the general manner with shell-lac varnish.

Manner of Varnishing JAPAN Work.—The last and finishing part of japanning lies in the laying on and polishing the outer coats of varnish ; which are necessary, as well in the pieces that have only one simple ground of colour, as with those that are painted. This is in general best done with common seed-lac varnish, except in the instances and on those occasions where we have already shown other methods to be more expedient : and the same reasons which decide as to the fitness or impropriety of the varnishes, with respect to the colours of the ground, hold equally with regard to those of the painting : for where brightness is the most material point, and a tinge of yellow will injure it, seed-lac must give way to the whiter gums ; but where hardness, and a greater tenacity, are most essential, it must be adhered to ; and where both are so necessary, that it is proper one should give way to the other in a certain degree reciprocally, a mixed varnish must be adopted.

This mixed varnish, as we have already observed, should be made of the picked seed-lac. The common seed-lac varnish, which is the most useful preparation of the kind hitherto invented, may be thus made :

Japanning. “ Take of seed-lac three ounces, and put it into water to free it from the sticks and filth that are frequently intermixed with it ; and which must be done by stirring it about, and then pouring off the water, and adding fresh quantities in order to repeat the operation, till it be freed from all impurities, as it very effectually may be by this means. Dry it then, and powder it grossly, and put it, with a pint of rectified spirit of wine, into a bottle, of which it will not fill above two-thirds. Shake the mixture well together ; and place the bottle in a gentle heat, till the seed appear to be dissolved ; the shaking being in the mean time repeated as often as may be convenient : and then pour off all that can be obtained clear by this method, and strain the remainder through a coarse cloth. The varnish thus prepared must be kept for use in a bottle well stop’d.”

When the spirit of wine is very strong, it will dissolve a greater proportion of the seed-lac : but this will saturate the common, which is seldom of a strength sufficient for making varnishes in perfection. As the chilling, which is the most inconvenient accident attending those of this kind, is prevented, or produced more frequently, according to the strength of the spirit ; we shall therefore take this opportunity of showing a method by which weaker rectified spirits may with great ease, at any time, be freed from the phlegm, and rendered of the first degree of strength.

“ Take a pint of the common rectified spirit of wine, and put it into a bottle, of which it will not fill above three parts. Add to it half an ounce of pearl-ashes, salt of tartar, or any other alkaline salt, heated red-hot, and powdered, as well as it can be without much loss of its heat. Shake the mixture frequently for the space of half an hour ; before which time, a great part of the phlegm will be separated from the spirit, and will appear, together with the undissolved part of the salts, in the bottom of the bottle. Let the spirit then be poured off, or freed from the phlegm and salts, by means of a tritorium or separating funnel ; and let half an ounce of the pearl-ashes, heated and powdered as before, be added to it, and the same treatment repeated. This may be done a third time, if the quantity of phlegm separated by the addition of the pearl-ashes appear considerable. An ounce of alum reduced to powder and made hot, but not burnt, must then be put into the spirit, and suffered to remain some hours ; the bottle being frequently shaken : after which, the spirit, being poured off from it, will be fit for use.”

The addition of the alum is necessary, to neutralize the remains of the alkaline salt or pearl-ashes ; which would otherwise greatly deprave the spirit with respect to varnishes and laquer, where vegetable colours are concerned ; and must consequently render another distillation necessary.

The manner of using the seed-lac or white varnishes is the same, except with regard to the substance used in polishing ; which, where a pure white or great clearness of other colours is in question, should be itself white : whereas the browner sorts of polishing dust, as being cheaper, and doing their business with greater dispatch, may be used in other cases. The pieces of work to be varnished should be placed near a fire, or in a room where there is a stove, and made perfectly

Japanning, dry; and then the varnish may be rubbed over them by the proper brushes made for that purpose, beginning in the middle, and passing the brush to one end; and then with another stroke from the middle, passing it to the other. But no part should be crossed or twice passed over, in forming one coat, where it can possibly be avoided. When one coat is dry, another must be laid over it; and this must be continued at least five or six times, or more, if on trial there be not sufficient thickness of varnish to bear the polish, without laying bare the painting or the ground colour underneath.

When a sufficient number of coats is thus laid on, the work is fit to be polished: which must be done, in common cases, by rubbing it with a rag dipped in Tripoli or pumice-stone, commonly called *rotten stone*, finely powdered: but towards the end of the rubbing, a little oil of any kind should be used along with the powder; and when the work appears sufficiently bright and glossy, it should be well rubbed with the oil alone, to clean it from the powder, and give it a still brighter lustre.

In the case of white grounds, instead of the Tripoli or pumice-stone, fine putty or whiting must be used; both which should be washed over to prevent the danger of damaging the work from any sand or other gritty matter that may happen to be commixed with them.

It is a great improvement of all kinds of japan work, to harden the varnish by means of heat; which, in every degree that it can be applied short of what would burn or calcine the matter, tends to give it a more firm and strong texture. Where metals form the body, therefore, a very hot stove may be used, and the pieces of work may be continued in it a considerable time; especially if the heat be gradually increased; but where wood is in question, heat must be sparingly used, as it would otherwise warp or shrink the body, so as to injure the general figure.

JAPHETH, the son of Noah. His descendants possessed all Europe and the isles in the Mediterranean, as well those which belong to Europe, as others which depend on Asia. They had all Asia Minor, and the northern parts of Asia above the sources of the Tigris and Euphrates. Noah, when he blessed Japheth, said to him, "God shall enlarge Japheth, and he shall dwell in the tents of Shem; and Canaan shall be his servant." This blessing of Noah was accomplished, when the Greeks, and after them the Romans, carried their conquests into Asia and Africa, where were the dwellings and dominions of Shem and Canaan.

The sons of Japheth were Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras. The scripture says, "that they peopled the isles of the Gentiles, and settled in different countries, each according to his language, family, and people." It is supposed, that Gomer was the father of the Cimbri, or Cimmerians; Magog of the Scythians; Madai of the Macedonians or Medes; Javan of the Ionians and Greeks; Tubal of the Tibarenians; Meshech of the Muscovites or Russians; and Tiras of the Thracians. By the isles of the Gentiles, the Hebrews understand the isles of the Mediterranean, and all the countries separated by the

sea from the continent of Palestine; whither also the Hebrews could go by sea only, as Spain, Gaul, Italy, Greece, Asia Minor.

Japheth was known by profane authors under the name of Japetus. The poets make him the father of heaven and earth. The Greeks believe that he was the father of their race, and acknowledged nothing more ancient than him. Besides the seven sons of Japheth above mentioned, the Septuagint, Eusebius, the Alexandrian Chronicle, and St Auilin, give him an eighth called *Eliza*, who is not mentioned either in the Hebrew or Chaldee, and the eastern people affirm that Japheth had eleven children.

JAPYDIA, in *Ancient Geography*, a western district of Illyricum, anciently threefold; the first *Japydia* extending from the springs of the Timavus to Istria; the second, from the river Arsia to the river Tedanius; and the third, called *Inalpina*, situated in Mount Albius and the other Alps, which run out above Istria. *Japodes*, or *Japydes*, the people. Now constituting the south part of Carniola, and the west of Austrian-Croatia.

JAPYDIA, CALABRIA anciently so called by the Greeks. *Japyges*, the people.

JAPYGIUM, in *Ancient Geography*, a promontory of Calabria; called also *Salentinum*. Now *Capo di S. Maria di Leuca*.

JAQUELOT, ISAAC, a celebrated French Protestant divine, born in 1647, at Vassy in Champagne, where his father was minister. The revocation of the edict of Nantz obliging him to quit France, he took refuge first at Heidelberg, and then at the Hague, where he procured an appointment in the Walloon church. Here he continued till that capital was taken by the king of Prussia, who, hearing him preach, made him his French minister in ordinary at Berlin; to which city he removed in 1702. While he lived at Berlin, he entered into a warm controversy with M. Bayle on the doctrine advanced in his dictionary favouring manichæism, which continued until death imposed silence on both parties: and it was in this dispute that M. Jaquelot openly declared in favour of the Remonstrants. He wrote, among other works, 1. *Dissertations sur l'existence de Dieu*. 2. *Dissertations sur le Messie*. 3. *Lettres à Messieurs les Prelats de l'Eglise Gallicane*. He was employed in finishing an important work upon the divine authority of the holy scriptures, when he died suddenly in 1708, aged 61.

JAR, or **JARR**, an earthen pot or pitcher, with a big belly and two handles.—The word comes from the Spanish *jarra* or *jarro*, which signifies the same.

JAR is used for a sort of measure or fixed quantity of divers things.—The *jar* of oil is from 18 to 26 gallons; the *jar* of green ginger is about 100 pounds weight.

JARCHI, SOLOMON, otherwise *Raschi* and *Isaaki Solomon*, a famous rabbi, born at Troyes in Champagne, who flourished in the 12th century. He was a perfect master of the talmud and gemara; and he filled the postils of the bible with so many talmudical reveries, as totally extinguished both the literal and moral sense of it. A great part of his commentaries are printed in Hebrew, and some have been translated into

Japydia
Jarchi.

Jardyn into Latin by the Christians. They are all greatly esteemed by the Jews, who have bestowed on the author the title of *prince of commentators*.

JARDYN, or JARDIN, KAREL DU, painter of conversations, landscapes, &c. was born at Amsterdam in 1640, and became a disciple of Nicholas Berchem. He travelled to Italy whilst he was yet a young man; and arriving at Rome, he gave himself alternately up to study and dissipation. Yet, amidst this irregularity of conduct, his proficiency in the art was surprising; and his paintings rose into such high repute, that they were exceedingly coveted in Rome, and bought up at great prices. With an intention to visit his native city he at last left Rome; but passing through Lyons, and meeting some agreeable companions, they prevailed on him to stay there for some time, and he found as much employment in that city as he could possibly undertake or execute. But the profits which arose from his paintings were not proportionable to his profusion; and in order to extricate himself from the encumbrances in which his extravagance had involved him, he was induced to marry his hostess, who was old and disagreeable, but very rich. Mortified and ashamed at that adventure, he returned as expeditiously as possible to Amsterdam, accompanied by his wife, and there for some time followed his profession with full as much success as he had met with in Italy or Lyons. He returned to Rome the second time; and after a year or two spent there in his usual extravagant manner, he settled at Venice. In that city his merit was well known before his arrival, which procured him a very honourable reception. He lived there highly caressed, and continually employed; but died at the age of 38. He was sumptuously interred, out of respect to his talents; and although a Protestant, permitted to be laid in consecrated ground. This painter, in his colouring and touch, resembled his master Berchem; but he added to that manner a force which distinguishes the great masters of Italy; and it is observed, that most of his pictures seem to express the warmth of the sun, and the light of mid-day. His pictures are not much encumbered; a few figures, some animals, and a little landscape for the back-grounds, generally comprise the whole of his composition. However, some of his subjects are often more extensive, containing more objects, and a larger design. His works are as much sought after, as they are difficult to be met with.

JARGON, or ZIRCON, a kind of precious stone found in Ceylon. This mineral contains a peculiar earth, called *jargon*, or *zirconia*; for an account of the properties of which, see CHEMISTRY, page 611; see also MINERALOGY *Index*.

JARGONIA, or ZIRCONIA, in *Chemistry*, a peculiar earth obtained from the preceding mineral. See CHEMISTRY, p. 611.

JARIMUTH, JARMUTH, or *Ferimoth*, Josh. xv. a town reckoned to the tribe of Judah, four miles from Eleutheropolis, westward, (Jerome.) Thought to be the same with Ramoth and Remeth, Joshua xix. and Nehem x. 2. (Reland).

JARNAC, a town of France, in Orleanois, and in Angumois, remarkable for a victory gained by Henry III. over the Huguenots in 1569. It is seated on the river Charente, in W. Long. 0. 13. N. Lat. 45. 40.

JAROSLOW, a handsome town of Poland, in the palatinate of Russia, with a strong citadel. It is remarkable for its great fair, its handsome buildings, and a battle gained by the Swedes in 1656, after which they took the town. It is seated on the river Saine, in E. Long. 22. 23. N. Lat. 49. 58.

JASHER, THE BOOK OF. This is a book which Joshua mentions, and refers to in the following passage: "And the sun stood still, and the moon stayed, until the people had avenged themselves upon their enemies: is not this written in the book of Jasher?"

It is difficult to determine what this *book of Jasher*, or "the upright," is. St Jerome and the Jews believed it to be Genesis, or some other book of the Pentateuch, wherein God foretold he would do wonderful things in favour of his people. Huetius supposes it was a book of morality, in which it was said that God would subvert the course of nature in favour of those who put their trust in him. Others pretend, it was public annals, or records, which were styled *justice* or *upright*, because they contained a faithful account of the history of the Israelites. Grotius believes, that this book was nothing else but a song, made to celebrate this miracle and this victory. This seems the more probable opinion, because the words cited by Joshua as taken from this work, "Sun, stand thou still upon Gibeon, and thou moon in the valley of Ajalon," are such poetical expressions as do not suit with historical memoirs; besides that in the 2d book of Samuel (i. 18.) mention is made of a book under the same title, on account of a song made on the death of Saul and Jonathan.

JASIONE, a genus of plants belonging to the Syngenesia class; and in the natural method ranking under the 29th order, *Campanaceæ*. See BOTANY *Index*.

JASMINE. See JASMINUM.

Arabian JASMINE. See NYCTANTHES, BOTANY *Index*.

JASMINUM, JASMINE, or *Jessamine tree*, a genus of plants belonging to the diandria class; and in the natural method ranking under the 44th order, *Scpiarix*. See BOTANY *Index*.

JASON, the Greek hero who undertook the Argonautic expedition, the history of which is obscured by fabulous traditions, flourished about 937 B. C. See ARGONAUTS.

JASPACHATES. See JADE-STONE, MINERALOGY *Index*.

JASPER, a species of a mineral belonging to the argillaceous genus of stones, and of which there are many varieties, some of which being extremely beautiful, are much sought after, and employed as trinkets and ornaments. See MINERALOGY *Index*.

JASPONYX, an old term in mineralogy, importing, as appears from the name, a compound of jasper and onyx.

JATROPHA, the CASSADA PLANT, a genus of plants belonging to the monœcia class; and in the natural method ranking under the 38th order, *Tricocca*. See BOTANY *Index*.

JAVA, a large island of the East Indies, lying between 105° and 116° E. Long. and from 6° to 8° S. Lat. extending in length 700 miles, and in breadth about 100. It is situated to the south of Borneo, and south-east

Jaroslow
||
Java.

Java.

South-east from the peninsula of Malacca, having Sumatra lying before it, from which it is separated by a narrow passage, now so famous in the world by the name of the *Straits of Sunda*. The country is mountainous and woody in the middle; but a flat coast, full of bogs and marshes, renders the air unhealthful. It produces pepper, indigo, sugar, tobacco, rice, coffee, cocoa-nuts, plantains, cardamoms, and other tropical fruits. Gold also, but in no great quantities, hath been found in it. It is diversified by many mountains, woods, and rivers; in all which nature has very bountifully bestowed her treasures. Many of the mountains are so high as to be seen at the distance of a number of leagues. That which is called the *Blue Mountain* is by far the highest of them all, and seen the farthest off at sea. They have frequent and very terrible earthquakes in this island, which shake the city of Batavia and places adjacent, to such a degree, that the fall of the houses is expected every moment. The waters in the road are excessively agitated, insomuch that their motion resembles that of a boiling pot; and in some places the earth opens, which affords a strange and terrible spectacle. The inhabitants are of opinion, that these earthquakes proceed from the mountain Parang, which is full of sulphur, saltpetre, and bitumen. The fruits and plants of this island are in their several kinds excellent, and almost out of number. There are abundance of forests scattered over it, in which are all kinds of wild beasts, such as buffaloes, tygers, rhinoceroses, and wild horses, with an infinite variety of serpents, some of them of an enormous size. Crocodiles are prodigiously large in Java, and are found chiefly about the mouths of rivers; for, being amphibious animals, they delight mostly in marshes and savannas. This creature, like the tortoise, lays its eggs in the hot sands, without taking any further care of them; the sun hatches them at the proper season, when the young run instantly into the water. There is, in short, no kind of animal wanting here: fowls they have of all sorts, and exquisitely good, especially peacocks, partridges, pheasants, wood-pigeons: and, for curiosity, they have the Indian bat, which differs little in form from ours; but its wings, when extended, measure a full yard, and the body of it is of the size of a rat. They have fish in great plenty, and very good; so that for the value of three-pence there may be enough bought to dine six or seven men. They have likewise a multitude of tortoises, the flesh of which is very little inferior to veal, and there are many who think it better.

It is said, that there are in the island upwards of 40 great towns, which, from the number of their inhabitants, would, in any other part of the world, merit the name of *cities*; and more than 4500 villages, besides hamlets, and straggling houses, lying very near each other, upon the sea coast, and in the neighbourhood of great towns: hence, upon a fair and moderate computation, there are within the bounds of the whole island, taking in persons of both sexes, and of all ranks and ages, more than thirty millions of souls; so that it is thrice as populous as France, which, though twice as big, is not computed to have more than twenty millions of inhabitants.

There are a great many princes in the island, of which the most considerable are, the emperor of Ma-

Java.

teran, who resides at Katakura, and the kings of Bantam and Japara. Upon the first of these many of the petty princes are dependant; but the Dutch are absolute masters of the greatest part of the island, particularly of the north coast, though there are some of the princes beyond the mountains, on the south coast, who still maintain their independency. The natives of the country, who are established in the neighbourhood of Batavia, and for a tract of about 40 leagues along the mountains of the country of Bantam, are immediately subject to the governor-general. The company send drovards, or commissaries, among them, who administer justice and take care of the public revenues.

The city of Batavia is the capital not only of this island but of all the Dutch dominions in India. It is an exceeding fine city, situated in the latitude of 6° south, at the mouth of the river Jucatra, and in the bosom of a large commodious bay, which may be considered not only as one of the safest harbours in India, but in the world. The city is surrounded by a rampart 21 feet thick, covered on the outside with stone and fortified with 22 bastions. This rampart is environed by a ditch 45 yards over, and full of water, especially when the tides are high, in the spring. The avenues to the town are defended by several forts, each of which is well furnished with excellent brass cannon: no person is suffered to go beyond these forts without a passport. The river Jucatra passes through the middle of the town, and forms 15 canals of running water, all faced with free-stone, and adorned with trees that are ever green: over these canals are 56 bridges, besides those which lie without the town. The streets are all perfectly straight, and each, generally speaking, 30 feet broad. The houses are built of stone, after the manner of those in Holland. The city is about a league and a half in circumference, and has five gates; but there are ten times the number of houses without that there are within it. There is a very fine town-house, four Calvinist churches, besides other places of worship for all sorts of religions, a spin-huys or house of correction, an orphan house, a magazine of sea stores, several for spices, with wharfs and cord manufactories, and many other public buildings. The garrison consists commonly of between 2000 and 3000 men. Besides the forts mentioned above, there is the citadel of Batavia, a very fine regular fortification, situated at the mouth of the river, and flanked with four bastions; two of which command the sea, and the other two the town. It is in the citadel that the governor-general of the Indies has his palace; over against which is that of the director-general, who is the next person to the governor. The counsellors, and other principal officers of the company, have also their apartments there; as have likewise the physician, the surgeon, and the apothecary. There are in it, besides, arsenals and magazines furnished with ammunition for many years. The city of Batavia is not only inhabited by Dutch, French, Portuguese, and other Europeans, established here on account of trade; but also by a vast number of Indians of different nations, Javaneze, Chinese, Malayans, Negroes, Amboynese, Armenians, natives of the isle of Bali, Mardykens or Topasses, Macassers, Timors, Bougis, &c. Of the Chinese, there are, it is

said,

faid, about 100,000 in the island; of which near 30,000 resided in the city till the year 1740, when the Dutch, pretending that they were in a plot against them, sent a body of troops into their quarter, and demanded their arms, which the Chinese readily delivered up; and the next day the governor sent another body, with orders to murder and massacre every one of the Chinese, men, women, and children. Some relate there were 20,000, others 30,000, that were put to death, without any manner of trial: and yet the barbarous governor, who was the instrument of this cruel proceeding, had the assurance to embark for Europe, imagining he had amassed wealth enough to secure him against any prosecution in Holland: but the Dutch, finding themselves detested and abhorred by all mankind for this piece of tyranny, endeavoured to throw the odium of it upon the governor, though he had the hands of all the council of Batavia, except one, to the order for the massacre. The states, therefore, dispatched a packet to the Cape of Good Hope, containing orders to apprehend the governor, and send him back to Batavia to be tried. He was accordingly apprehended at the Cape; but was never heard of afterwards. It is supposed he was thrown over-board in his passage to Batavia, that there might be no farther inquiries into the matter; and it is said, all the wealth this merciful gentleman had amassed, and sent over before him in four ships, was cast away in the passage.

Besides the garrison here, the Dutch had formerly about 15,000 men in the island, either Dutch, or formed out of the several nations they had enslaved; and they had a fleet of between 20 and 30 men of war, with which they gave law to every power on the coast of Asia and Africa, and to all the European powers that visit the Indian ocean, unless we should except the British: it was, however, but a little before the revolution that they expelled us from our settlement at Bantam.

JAVELIN, in antiquity, a sort of spear five feet and an half long; the shaft of which was of wood, with a steel point.—Every soldier in the Roman armies had seven of these, which were very light and slender.

JAWER, a city of Silesia, capital of a province of the same name, with a citadel, and a large square, surrounded with piazzas. It is 12 miles south-east of Lignitz, 30 south-west of Breslau, and 87 east of Prague. E. Long. 16. 29. N. Lat. 50. 56.

JAUNDICE (derived from the French *jaunisse* "yellowness," of *jaune* "yellow"); a disease consisting in a suffusion of the bile, and a rejection thereof to the surface of the body, whereby the whole exterior habit is discoloured. Dr Maclurg is of opinion, that the bile returns into the circulation in this disorder by the course of the lymphatics. See *MEDICINE Index*.

JAWS. See *MAXILLÆ*.

Locked Jaw, is a spasmodic contraction of the lower jaw, commonly produced by some external injury affecting the tendons or ligaments. See *MEDICINE Index*.

JAY, see *CORVUS*, *ORNITHOLOGY Index*.

JAY, *Guy Michael le*, a French gentleman, who distinguished himself by causing a polyglot bible to be

printed at his own expence in 10 vols folio: but he ruined himself by that impression, first because he would not suffer it to appear under the name of Cardinal Richelieu, who, after the example of Cardinal Ximenes, was ambitious of eternizing his name by this means; and next, because he made it too dear for the English market; on which Dr Walton undertook his polyglot bible, which, being more commodious, reduced the price of M. le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Veze-lay in the Nivernois, and Louis XIV. gave him the post of counsellor of state.

JAZER, or JASER, in *Ancient Geography*, a Levitical city in the territory of the Amorrites beyond Jordan, 10 miles to the west, or rather south-west, of Philadelphia, and 15 miles from Esebon, and therefore situated between Philadelphia and Hehbon, on the east border of the tribe of Gad, supposed to be the *Jazorem* of Josephus. In Jeremiah xlviii. mention is made of the sea of Jazer, that is, a lake; taken either for an effusion or overflowing of the Arnon, a lake through which it passes, or from which it takes its rise.

IBERIA, SPAIN so called by the ancients, from the river Iberus. *Iberes* the people, from the nominative *Iber*. See *HISPANIA*.

IBERIA was also the name of an inland country of Asia, having Colchis to the west, with a part of Pontus; to the north Mount Caucasus; on the east Albania; and on the south Armenia Magna: Now the western part of Georgia (See *GEORGIA*). Iberia, according to Josephus, was first peopled by Tubal, the brother of Gomer and Magog. His opinion is confirmed by the Septuagint; for Meshech and Tubal are by these interpreters rendered *Moschi* and *Iberians*. We know little of the history of the country till the reign of Mithridates, when their king, named *Artocis*, siding with that prince against Lucullus, and afterwards against Pompey, was defeated by the latter with great slaughter; but afterwards obtained a peace, upon delivering up his sons as hostages. Little notice is taken of the succeeding kings by the ancient historians. They were probably tributary to the Romans till that empire was overturned, when this, with the other countries in Asia bordering on it, fell successively under the power of the Saracens and Turks.

IBERIS, SCIATICA CRESSES, or *Candy-tuft*, a genus of plants belonging to the tetradynamia class, and in the natural method ranking under the 39th order, *Siliquose*. See *BOTANY Index*.

IBEX, a species of goat. See *CAPRA*, *MAMMALIA Index*.

IBIS. See *TANTALUS*, *ORNITHOLOGY Index*.

IBYCUS, a Greek lyric poet, of whose works there are only a few fragments remaining, flourished 550 B. C. It is said, that he was assassinated by robbers; and that, when dying, he called upon some cranes he saw flying to bear witness. Some time after, one of the murderers seeing some cranes, said to his companions, "There are the witnesses of Ibycus's death;" which being reported to the magistrates, the assassins were put to the torture, and having confessed the fact, were hanged. Thence arose the proverb *Ibyci Crues*.

ICE, in *Physiology*, a solid, transparent, and brittle body,

body, formed of some fluid, particularly water, by means of cold.

The younger Lemery observes, that ice is only a re-establishment of the parts of water in their natural state; that the mere absence of fire is sufficient to account for this re-establishment; and that the fluidity of water is a real fusion, like that of metals exposed to the fire; differing only in this, that a greater quantity of fire is necessary to the one than the other. Galileo was the first that observed ice to be lighter than the water which composed it: and hence it happens, that ice floats upon water, its specific gravity being to that of water as eight to nine. This rarefaction of ice seems to be owing to the air-bubbles produced in water by freezing; and which, being considerably large in proportion to the water frozen, render the body so much specifically lighter: these air-bubbles, during their production, acquire a great expansive power, so as to burst the containing vessels, though ever so strong.

M. Mairan, in a dissertation on ice, attributes the increase of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy skin on the water being composed of filaments, which, according to him, are found to be constantly and regularly joined at an angle of 60° ; and which, by this angular disposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14th, an 18th, a 19th; and when the water was previously purged of air, only a 22d part: that ice, even after its formation, continues to expand by cold; for, after water had been frozen to some thickness, the fluid part being let out by a hole in the bottom of the vessel, a continuance of the cold made the ice convex; and a piece of ice, which was at first only a 14th part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter. To this cause he attributes the curling of ice on ponds.

Wax, resins, and animal fats, made fluid by fire, instead of expanding like watery liquors, shrink in their return to solidity: for solid pieces of the same bodies sink to the bottom of the respective fluids; a proof that these bodies are more dense in their solid than in their fluid state. The oils which congeal by cold, as oil olive, and the essential oil of aniseeds, appear also to shrink in their congelation. Hence, the different dispositions of different kinds of trees to be burst by, or to resist, strong frosts, are by some attributed to the juices with which the tree abounds; being in the one case watery, and in the other resinous or oily.

Though it has been generally supposed that the natural crystals of ice are stars of six rays, forming angles of 60° with each other, yet this crystallization of water, as it may properly be called, seems to be as much affected by circumstances as that of salts. Hence we find a considerable difference in the accounts of those who have undertaken to describe these crystals. M. Mairan informs us, that they are stars with six radii; and his opinion is confirmed by observing the figure of frost on glass. M. Rome de L'Isle determines the form of the solid crystal to be an equilateral octaedron. M. Hassenfratz found it to be a prismatic hexaedron; but M. d'Antic found a method of reconciling these

seemingly opposite opinions. In a violent hail-storm, where the hailstones were very large, he found they had sharp wedge-like angles of more than half an inch; and in these he supposed it impossible to see two pyramidal tetraedra joined laterally, and not to conclude that each grain was composed of octaedrons converging to a centre. Some had a cavity in the middle; and he saw the opposite extremities of two opposite pyramids, which constitute the octaedron; he likewise saw the octaedron entire united in the middle: all of them were therefore similar to the crystals formed upon a thread immersed in a saline solution. On these principles M. d'Antic constructed an artificial octaedron resembling one of the largest hailstones; and found that the angle at the summit of the pyramid was 45° , but that of the junction of the two pyramids 145° . It is not, however, easy to procure regular crystals in hailstones where the operation is conducted with such rapidity: in snow and hoar-frost, where the crystallization goes on more slowly, our author is of opinion that he sees the rudiments of octaedra.

Ice forms generally on the surface of the water: but this too, like the crystallization, may be varied by an alteration in the circumstances. In Germany, particularly the northern parts of that country, it has been observed that there are three kinds of ice. 1. That which forms on the surface. 2. Another kind formed in the middle of the water, resembling nuclei or small hail. 3. The ground ice which is produced at the bottom, especially where there is any fibrous substance to which it may adhere. This is full of cells like a wasp's nest, but less regular; and performs many strange effects in bringing up very heavy bodies from the bottom, by means of its inferiority in specific gravity to the water in which it is formed. The ice which forms in the middle of the water rises to the top, and there unites into large masses; but the formation both of this and the ground ice takes place only in violent and sudden colds, where the water is shallow, and the surface disturbed in such a manner that the congelation cannot take place. The ground ice is very destructive to dykes and other aquatic works. In the more temperate European climates these kinds of ice are not met with.

In many countries the warmth of the climate renders ice not only a desirable, but even a necessary article; so that it becomes an object of some consequence to fall upon a ready and cheap method of procuring it. We shall here take notice of some attempts made by Mr Cavallo to discover a method of producing a sufficient degree of cold for this purpose by the evaporation of volatile liquors. He found, however, in the course of these experiments, that ether was incomparably superior to any other fluid in the degree of cold it produced. The price of the liquor naturally induced him to fall upon a method of using it with as little waste as possible. The thermometer he made use of had the ball quite detached from the ivory piece on which the scale was engraved. The various fluids were then thrown upon the ball through the capillary aperture of a small glass vessel shaped like a funnel; and care was taken to throw them upon it so slowly, that a drop might now and then fall from the under part, excepting when those fluids were used, which

Ice. which evaporate very slowly; in which case it was sufficient barely to keep the ball moist, without any drop falling from it. During the experiment, the thermometer was kept very gently turning round its axis, that the fluid made use of might fall upon every part of its ball. He found this method preferable to that of dipping the ball of the thermometer into the fluid and taking it out again immediately, or even of anointing it constantly with a feather. The evaporation, and consequently the cold, produced by it, may be increased by blowing on the thermometer with a pair of bellows; though this was not used in the experiments now to be related, on account of the difficulty of its being performed by one person, and likewise because it occasions much uncertainty in the results.

The room in which the experiments were made was heated to 64° of Fahrenheit; and with water it was reduced to 56° , viz. 8° below that of the room or of the water employed. The effect took place in about two minutes; but though the operation was continued for a longer time, it did not sink lower. With spirit of wine it sunk to 48° . The cold was greater with highly rectified spirit than with the weaker sort; but the difference is less than would be expected by one who had never seen the experiment made. The pure spirit produces its effect much more quickly. On using various other fluids which were either compounded of water and spirituous liquors, or pure essences, he found that the cold produced by their evaporation was generally some intermediate degree between that produced by water and the spirit of wine. Oil of turpentine sunk the mercury three degrees; but olive oil and others, which evaporate very slowly, or not at all, did not sensibly affect the thermometer.

To observe how much the evaporation of spirit of wine, and consequently the cold produced by it, would be increased by electricity, he put the tube containing it into an insulating handle, and connected it with the conductor of an electrical machine, which was kept in action during the time of making the experiment; by which means one degree of cold seemed to be gained, as the mercury now sunk to 47° instead of 48° , at which it had stood formerly. On trying the three mineral acids, he found that they heated the thermometer instead of cooling it; which effect he attributes to the heat they themselves acquired by uniting with the moisture of the atmosphere. The vitriolic acid, which was very strong and transparent, raised the mercury to 102° , the smoking nitrous acid to 72° , and the marine to 66° .

The apparatus for using the least possible quantity of ether for freezing water consists in a glass tube (fig. 1.) terminating in a capillary aperture, which is to be fixed upon the bottle containing the ether. Round the lower part of the neck at A some thread is wound, in order to let it fit the neck of the bottle. When the experiment is to be made, the stopper of the bottle containing the ether is to be removed, and the tube just mentioned put in its room. The thread round the tube ought also to be previously moistened with water or spittle before it is put into the neck of the bottle, in order the more effectually to prevent the escape of the ether betwixt the neck of the phial and tube. Hold then the bottle by its bottom FG (fig. 2.)

and keeping it inclined as in the figure, the small stream of ether issuing out of the aperture D of the tube DE, is directed upon the ball of the thermometer, or upon a tube containing water or other liquor that is required to be congealed. As ether is very volatile, and has the remarkable property of increasing the bulk of air, there is no aperture requisite to allow the air to enter the bottle while the liquid flows out. The heat of the hand is more than sufficient to force out the ether in a continued stream at the aperture D.

In this manner, throwing the stream of ether upon the ball of a thermometer in such a quantity that a drop might now and then, every ten seconds for instance, fall from the bulb of the thermometer, Mr Cavallo brought the mercury down to 3° , or 29° below the freezing point, when the atmosphere was somewhat hotter than temperate. When the ether is very good, i. e. capable of dissolving elastic gum, and has a small bulb, not above 20 drops of it are required to produce this effect, and about two minutes of time; but the common sort must be used in greater quantity, and for a longer time; though at last the thermometer is brought down by this very nearly as low as by the best sort.

To freeze water by the evaporation of ether, Mr Cavallo takes a thin glass tube about four inches long, and one-fifth of an inch diameter, hermetically sealed at one end, with a little water in it, so as to take up about half an inch of the cavity, as is shewn at CB in fig. 3. Into this tube a slender wire H is also introduced, the lower extremity of which is twisted into a spiral, and serves to draw up the bit of ice when formed. He then holds the glass tube by its upper part A with the fingers of the left hand, and keeps it continually and gently turning round its axis, first one way and then the other: whilst with the right hand he holds the phial containing the ether in such a manner as to direct the stream on the outside of the tube, and a little above the surface of the water contained in it. The capillary aperture D should be kept almost in contact with the surface of the tube containing the water; and by continuing the operation for two or three minutes, the water will be frozen as it were in an instant; and the opacity will ascend to C in less than half a second of time, which makes a beautiful appearance. This congelation, however, is only superficial: and in order to congeal the whole quantity of water, the operation must be continued a minute or two longer; after which the wire H will be found kept very tight by the ice. The hand must then be applied to the outside of the tube, in order to soften the surface of the ice; which would otherwise adhere very firmly to the glass; but when this is done, the wire H easily brings it out.

Sometimes our author was accustomed to put into the tube a small thermometer instead of the wire H; and thus he had an opportunity of observing a very curious phenomenon unnoticed by others, viz. that in the winter time water requires a smaller degree of cold to congeal it than in the summer. In the winter, for instance, the water in the tube AB will freeze when the thermometer stands about 30° ; but in the summer, or even when the thermometer stands at 60° , the quicksilver must be brought down 10, 15, or even more degrees

Ice.

degrees below the freezing point before any congelation can take place. In the summer time therefore a greater quantity of ether, and more time, will be required to congeal any given quantity of water than in winter. When the temperature of the atmosphere has been about 40°, our author has been able to congeal a quantity of water with an equal quantity of good ether; but in summer, two or three times the quantity are required to perform the effect. "There seems (says he) to be something in the air, which, besides heat, interferes with the freezing of water, and perhaps of all fluids; though I cannot say from my own experience whether the above-mentioned difference between the freezing in winter and summer takes place with other fluids, as milk, oils, wines," &c.

The proportion of ether requisite to congeal water seems to vary with the quantity of the latter; that is, a large quantity of water seems to require a proportionably less quantity of ether to freeze it than a smaller one. "In the beginning of the spring (says Mr Cavallo), I froze a quarter of an ounce of water with about half an ounce of ether: the apparatus being larger, though similar to that described above. Now as the price of ether, sufficiently good for the purpose, is generally about 18d. or 2s. per ounce, it is plain, that with an expence under two shillings, a quarter of an ounce of ice, or ice-cream, may be made in every climate, and at any time, which may afford great satisfaction to those persons, who, living in those places where no natural ice is to be had, never saw or tasted any such delicious refreshment. When a small piece of ice, for instance, of about ten grains weight, is required, the necessary apparatus is very small, and the expence not worth mentioning. I have a small box four inches and a half long, two inches broad, and one and a half deep, containing all the apparatus necessary for this purpose; viz. a bottle capable of containing about one ounce of ether; two pointed tubes, in case one should break; a tube in which the water is to be frozen, and a wire. With the quantity of ether contained in this small and very portable apparatus, the experiment may be repeated about ten times. A person who wishes to perform such experiments in hot climates, and in places where ice is not easily procured, requires only a larger bottle of ether besides the whole apparatus described above." Electricity increases the cold produced by means of evaporating ether but very little, though the effect is perceptible. Having thrown the electrified and also the unelectrified stream of ether upon the bulb of a thermometer, the mercury was brought down two degrees lower in the former than in the latter case.

Our author observes, for the sake of those who may be inclined to repeat this experiment, that a cork confined this volatile fluid much better than a glass stopple, which it is almost impossible to grind with such exactness as to prevent entirely the evaporation of the ether. When a stopple, made very nicely out of an uniform and close piece of cork, which goes rather tight, is put upon a bottle of ether, the smell of that fluid cannot be perceived through it; but he never saw a glass stopple which could produce that effect. In this manner, ether, spirit of wine, or any other volatile fluid, may be preserved, which does not corrode cork by its fumes. When the stopple, however, is very

often taken out, it becomes loose, as it will also be by long keeping: in either of which cases it must be changed.

Blink of the Ice, is a name given by the pilots to a bright appearance near the horizon, occasioned by the ice, and observed before the ice itself is seen.

Ice-Boats, boats so constructed as to sail upon ice, and which are very common in Holland, particularly upon the river Maese and the lake Y. See Plate CCLXXVIII. They go with incredible swiftness, sometimes so quick as to affect the breath, and are found very useful in conveying goods and passengers over lakes and great rivers in that country. Boats of different sizes are placed in a transverse form upon a 2½ or 3 inch deal board; at the extremity of each end are fixed irons, which turn up in the form of skais; upon this plank the boat rests, and the two ends serve as out-riggers to prevent oversetting; whence ropes are fastened that lead to the head of the mast in the nature of shrouds, and others passed through a block across the bowsprit: the rudder is made somewhat like a hatchet with the head placed downward, which being pressed down, cuts the ice, and serves all the purposes of a rudder in the water, by enabling the helmsman to steer, tack, &c.

Method of making Ice-Cream. Take a sufficient quantity of cream, and, when it is to be mixed with raspberry, or currant, or pine, a quarter part as much of the juice or jam, as of the cream: after beating and straining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter vessel, and varying in size and shape at pleasure; cover the mould, and place it in a pail about two-thirds full of ice, into which two handfuls of salt have been thrown; turn the mould by the hand-hold with a quick motion to and fro, in the manner used for milling chocolate, for eight or ten minutes; then let it rest as long, and turn it again for the same time; and having left it to stand half an hour, it is fit to be turned out of the mould and to be sent to table. Lemon juice and sugar, and the juices of various kinds of fruits, are frozen without cream; and when cream is used, it should be well mixed.

Ice-Mills, a sort of structure or contrivance common upon the river Neva at Petersburg, and which afford a perpetual fund of amusement to the populace. They are constructed in the following manner. A scaffolding is raised upon the river about 30 feet in height, with a landing place on the top, the ascent to which is by a ladder. From this summit a sloping plane of boards, about four yards broad and 30 long, descends to the superficies of the river; it is supported by strong poles gradually decreasing in height, and its sides are defended by a parapet of planks. Upon these boards are laid square masses of ice about four inches thick, which being first smoothed with the axe and laid close to each other, are then sprinkled with water: by these means they coalesce, and, adhering to the boards, immediately form an inclined plane of pure ice. From the bottom of this plane the snow is cleared away for the length of 200 yards, and the breadth of four, upon the level bed of the river; and the sides of this course, as well as the sides and top of the scaffolding, are ornamented with firs and pines. Each person, being provided with

Ice.

Ice. a sledge, mounts the ladder; and having attained the summit, he seats himself upon his sledge at the upper extremity of the inclined plane, down which he suffers it to glide with considerable rapidity, poising it as he goes down; when the velocity acquired by the descent carries it above 100 yards upon the level ice of the river. At the end of this course, there is usually a similar ice-hill, nearly parallel to the former, which begins where the other ends; so that the person immediately mounts again, and in the same manner glides down the other inclined plane of ice. This diversion he repeats as often as he pleases. The boys also are continually employed in skating down these hills: they glide chiefly upon one skait, as they are able to poise themselves better upon one leg than upon two. These ice-hills exhibit a pleasing appearance upon the river, as well from the trees with which they are ornamented, as from the moving objects which at particular times of the day are descending without intermission.

Ice-House, a repository for ice during the summer months. The aspect of ice-houses should be towards the east or south-east, for the advantage of the morning sun to expel the damp air, as that is more pernicious than warmth: for which reason trees in the vicinity of an ice-house tend to its disadvantage.

The best soil for an ice-house to be made in is chalk, as it conveys away the waste water without any artificial drain; next to that, loose stony earth or gravelly soil. Its situation should be on the side of a hill, for the advantage of entering the cell upon a level, as in the drawing, Plate CCLXXXVIII.

To construct an ice-house, first choose a proper place at a convenient distance from the dwelling-house or houses it is to serve: dig a cavity (if for one family, of the dimensions specified in the design) of the figure of an inverted cone, sinking the bottom concave, to form a reservoir for the waste water till it can drain off; if the soil requires it, cut a drain to a considerable distance, or so far as will come out at the side of the hill, or into a well, to make it communicate with the springs, and in that drain form a sink or air-trap, marked *l*, by sinking the drain so much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will consequently be in the trap; and will keep the well air-tight. Work up a sufficient number of brick piers to receive a cart-wheel, to be laid with its convex side upwards to receive the ice; lay hurdles and straw upon the wheel, which will let the melted ice drain through, and serve as a floor. The sides and dome of the cone are to be nine inches thick—the sides to be done in steened brickwork, *i. e.* without mortar, and wrought at right angles to the face of the work: the filling in behind should be with gravel, loose stones, or brick-bats, that the water which drains through the sides may the more easily escape into the well. The doors of the ice-house should be made as close as possible, and bundles of straw placed always before the inner door to keep out the air.

Description of the parts referred to by the letters.—*a* The line first dug out. *b* The brick circumference of the cell. *c* The diminution of the cell downwards. *d* The lesser diameter of the cell. *e* The cart wheel

or joists and hurdles. *f* The piers to receive the wheel or floor. *g* The principal receptacle for straw. *h* The inner passage, *i* the first entrance. *k* the outer door, passages having a separate door each. *l* An air trap. *m* The well. *n* The profile of the piers. *o* The ice filled in. *p* The height of the cone. *q* The dome worked in two half brick arches. *r* The arched passage. *s* The door-ways inserted in the walls. *t* The floor of the passage. *u* An aperture through which the ice may be put into the cell; this must be covered next the crown of the dome, and then filled in with earth. *x* The sloping door, against which the straw should be laid.

The ice when to be put in should be collected during the frost, broken into small pieces, and rammed down hard in strata of not more than a foot, in order to make it one complete body; the care in putting it in, and well ramming it, tends much to its preservation. In a season when ice is not to be had in sufficient quantities, snow may be substituted.

Ice may be preserved in a dry place under ground, by covering it well with chaff, straw, or reeds.

Great use is made of chaff in some places of Italy to preserve ice: the ice-house for this purpose need only be a deep hole dug in the ground on the side of a hill, from the bottom of which they can easily carry out a drain, to let out the water which is separated at any time from the ice, that it may not melt and spoil the rest. If the ground is tolerably dry, they do not line the sides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole: this pit they fill either with pure snow, or else with ice taken from the purest and clearest water; because they do not use it as we do in England, to set the bottles in, but really mix it with the wine. They first cover the bottom of the hole with chaff, and then lay in the ice, not letting it anywhere touch the sides, but ramming in a large bed of chaff all the way between: they thus carry on the filling to the top, and then cover the surface with chaff; and in this manner it will keep as long as they please. When they take any of it out for use, they wrap the lump up in chaff, and it may then be carried to any distant place without waste or melting.

It appears from the investigation of Professor Beckman, in his History of Inventions, that the ancients from the earliest ages were acquainted with the method of preserving snow for the purpose of cooling liquors in summer. "This practice, (he observes), is mentioned by Solomon*; and proofs of it are so numerous in * *Proverbs*,
the works of the Greeks and the Romans, that it is ^{xxv. 15-} unnecessary for me to quote them, especially as they have been collected by others. How the repositories for keeping it were constructed, we are not expressly told; but it is probable that the snow was preserved in pits or trenches.

"When Alexander the Great besieged the city of Petra, he caused 30 trenches to be dug, and filled with snow, which was covered with oak branches; and which kept in that manner for a long time. Plutarch says, that a covering of chaff and coarse cloth is sufficient; and at present a like method is pursued in Portugal. Where the snow has been collected in a deep gulf, some grass or green sods, covered with dung from the

Ice.

sheep pens, is thrown over it; and under these it is so well preserved, that the whole summer through it is sent the distance of 60 Spanish (nearly 180 English) miles to Lisbon.

“When the ancients, therefore, wished to have cooling liquors, they either drank the melted snow, or put some of it in their wine; or they placed jars filled with wine in the snow, and suffered it to cool there as long as they thought proper. That ice was also preserved for the like purpose, is probable from the testimony of various authors; but it appears not to have been used so much in warm countries as in the northern. Even at present snow is employed in Italy, Spain, and Portugal; but in Persia ice. I have never any where found an account of Grecian or Roman ice-houses. By the writers on agriculture they are not mentioned.”

Ice-Island, a name given by sailors to a great quantity of ice collected into one huge solid mass, and floating about upon the seas near or within the Polar circles.—Many of these fluctuating islands are met with on the coasts of Spitzbergen, to the great danger of the shipping employed in the Greenland fishery. In the midst of those tremendous masses navigators have been arrested and frozen to death. In this manner the brave Sir Hugh Willoughby perished with all his crew in 1553; and in the year 1773, Lord Mulgrave, after every effort which the most finished seaman could make to accomplish the end of his voyage, was caught in the ice, and was near experiencing the same unhappy fate. See the account at large in *Phipps's Voyage to the North Pole*. As there described, the scene, divested of the horror from the eventful expectation of change, was the most beautiful and picturesque:—Two large ships becalmed in a vast basin, surrounded on all sides by islands of various forms: the weather clear: the sun gilding the circumambient ice, which was low, smooth, and even; covered with snow, excepting where the pools of water on part of the surface appeared crystalline with the young ice: the small space of sea they were confined in perfectly smooth. After fruitless attempts to force a way through the fields of ice, their limits were perpetually contracted by its closing; till at length it beset each vessel till they became immoveably fixed. The smooth extent of surface was soon lost: the pressure of the pieces of ice, by the violence of the swell, caused them to pack: fragment rose upon fragment, till they were in many places higher than the main-yard. The movements of the ships were tremendous and involuntary, in conjunction with the surrounding ice, actuated by the currents. The water shoaled to 14 fathoms. The grounding of the ice or of the ships would have been equally fatal: The force of the ice might have crushed them to atoms, or have lifted them out of the water and overset them, or have left them suspended on the summits of the pieces of ice at a tremendous height, exposed to the fury of the winds, or to the risk of being dashed to pieces by the failure of their frozen dock. An attempt was made to cut a passage through the ice; after a perseverance worthy of Britons, it proved fruitless. The commander, at all times master of himself, directed the boats to be made ready to be hauled over the ice, till they arrived at navigable water (a task alone of seven days), and in them to make their voyage to England. The boats were drawn progressively three whole days. At

Ice, Icebergs.

length a wind sprung up, the ice separated sufficiently to yield to the pressure of the full-sailed ships, which, after labouring against the resisting fields of ice, arrived on the 10th of August in the harbour of Smeeringberg, at the west end of Spitzbergen, between it and Hackluyt's Headland.

The forms assumed by the ice in this chilling climate are extremely pleasing to even the most incurious eye. The surface of that which is congealed from the sea water (for we must allow it two origins) is flat and even, hard, opaque, resembling white sugar, and incapable of being slid on, like the British ice. The greater pieces, or fields, are many leagues in length: the lesser are the meadows of the seals, on which these animals at times frolic by hundreds. The motion of the lesser pieces is as rapid as the currents: the greater, which are sometimes 200 leagues long, and 60 or 80 broad, move slow and majestically; often fix for a time, immovable by the power of the ocean, and then produce near the horizon that bright white appearance called the *blink*. The approximation of two great fields produces a most singular phenomenon: it forces the lesser (if the term can be applied to pieces of several acres square) out of the water, and adds them to their surface; a second and often a third succeeds; so that the whole forms an aggregate of a tremendous height. These float in the sea like so many rugged mountains, and are sometimes 500 or 600 yards thick; but the far greater part is concealed beneath the water. These are continually increased in height by the freezing of the spray of the sea, or of the melting of the snow, which falls on them. Those which remain in this frozen climate receive continual growth; others are gradually waisted by the northern winds into southern latitudes, and melt by degrees, by the heat of the sun, till they waste away, or disappear in the boundless element.

The collision of the great fields of ice, in high latitudes, is often attended with a noise that for a time takes away the sense of hearing any thing else; and the lesser with a grinding of unspeakable horror. The water which dashes against the mountainous ice freezes into an infinite variety of forms; and gives the voyager ideal towns, streets, churches, steeples, and every shape which imagination can frame.

Ice-Plant. See MESEMBRYANTHEMUM, BOTANY Index.

ICEBERGS, are large bodies of ice filling the valleys between the high mountains in northern latitudes. Among the most remarkable are those of the east coast of Spitzbergen (see GREENLAND, n^o 10.) They are seven in number, but at considerable distances from each other; each fills the valleys for tracts unknown in a region totally inaccessible in the internal parts. The glaciers* of Switzerland seem contemptible to* See *Gla-* these; but present often a similar front into some lower *ciers*. valley. The last exhibits over the sea a front 300 feet high, emulating the emerald in colour; cataracts of melted snow precipitate down various parts, and black spiring mountains, streaked with white, bound the sides, and rise crag above crag, as far as eye can reach in the back ground. See Plate CCLXXVIII. At times immense fragments break off, and tumble into the water, with a most alarming dashing. A piece of this vivid green substance has fallen, and grounded in 24 fathoms† *Phipps's* water, and spired above the surface 50 feet †. *Voyage,* *p. 70.*

Iceland. lar icebergs are frequent in all the Arctic regions; and to their lapses is owing the solid mountainous ice which infests those seas.—Frost sports wonderfully with these icebergs, and gives them majestic as well as other most singular forms. Masses have been seen assuming the shape of a Gothic church, with arched windows and doors, and all the rich drapery of that style, composed of what an Arabian tale would scarcely dare to relate, of crystal of the richest sapphirine blue; tables with one or more feet; and often immense flat-roofed temples, like those of Luxor on the Nile, supported by round transparent columns of cerulean hue, float by the astonished spectator. These icebergs are the creation of ages, and receive annually additional height by the falling of snows and of rain, which often instantly freezes, and more than repairs the loss occasioned by the influence of the melting sun.

ICELAND, a large island lying in the northern part of the Atlantic ocean, between 63 and 68 degrees of north latitude, and between 10 and 26 degrees of west longitude; its greatest length being about 700 miles, and its breadth 300.

General account of the country. This country lying partly within the frigid zone, and being liable to be surrounded with vast quantities of ice which come from the polar seas, is, on account of the coldness of its climate, very inhospitable; but much more so for other reasons. It is exceedingly subject to earthquakes; and so full of volcanoes, that the little part of it which appears fit for the habitation of man seems almost totally laid waste by them. The best account that hath yet appeared of the island of Iceland is in a late publication, intitled "Letters on Iceland, &c. written by Uno Von Troil, D. D. first chaplain to his Swedish majesty." This gentleman sailed from London on the 12th of July 1772, in company with Mr Banks, Dr Solander, and Dr James Lind of Edinburgh, in a ship for which 100l. Sterling was paid every month. After visiting the Western isles of Scotland, they arrived on the 28th of August at Iceland, where they cast anchor at Bessfestdr or Bessfastadr, lying in about 64° 6' N. Lat. in the western part of the island. The country had to them the most dismal appearance that can be conceived. "Imagine to yourself (says Dr Troil) a country, which from one end to the other presents to your view only barren mountains, whose summits are covered with eternal snow, and between them fields divided by vitrified cliffs, whose high and sharp points seem to vie with each other to deprive you of the sight of a little grass which scantily springs up among them. These same dreary rocks likewise conceal the few scattered habitations of the natives, and no where a single tree appears which might afford shelter to friendship and innocence. The prospect before us, though not pleasing, was uncommon and surprising. Whatever presented itself to our view bore the marks of devastation; and our eyes, accustomed to behold the pleasing coasts of England, now saw nothing but the vestiges of the operation of a fire, Heaven knows how ancient!"

2 account of the climate. The climate of Iceland, however, is not unwholesome, or naturally subject to excessive colds, notwithstanding its northerly situation. There have been instances indeed of Fahrenheit's thermometer sinking to 24° below the freezing point in winter, and rising to

104° in summer. Since the year 1749, observations have been made on the weather; and the result of these observations hath been unfavourable, as the coldness of the climate is thought to be on the increase, and of consequence the country is in danger of becoming unfit for the habitation of the human race. Wood, which formerly grew in great quantities all over the island, cannot now be raised. Even the hardy firs of Norway cannot be reared in this island. They seemed indeed to thrive till they were about two feet high; but then their tops withered, and they ceased to grow. This is owing chiefly to the storms and hurricanes which frequently happen in the months of May and June, and which are very unfavourable to vegetation of every kind. In 1772, Governor Thodal sowed a little barley, which grew very briskly; but a short time before it was to be reaped, a violent storm so effectually destroyed it, that only a few grains were found scattered about. Besides these violent winds, this island lies under another disadvantage, owing to the floating ice already mentioned, with which the coasts are often beset. This ice comes on by degrees, always with an easterly wind, and frequently in such quantities as to fill up all the gulfs on the north-west side of the island, and even covers the sea as far as the eye can reach; it also sometimes drives to other shores. It generally comes in January, and goes away in March. Sometimes it only reaches the land in April; and, remaining there for a long time, does an incredible deal of mischief. It consists partly of mountains of ice, said to be sometimes 60 fathoms in height; and partly of field ice, which is neither so thick nor so much dreaded. Sometimes these enormous masses are grounded in shoal-water; and in these cases they remain for many months, nay years, undissolved, chilling the atmosphere for a great way round. When many such bulky and lofty ice-masses are floating together, the wood which is often found drifting between them, is so much chafed, and pressed with such violence together, that it sometimes takes fire: which circumstance has occasioned fabulous accounts of the ice being in flames.

In 1753 and 1754, this ice occasioned such a violent cold, that horses and sheep dropped down dead by reason of it, as well as for want of food; horses were observed to feed upon dead cattle, and the sheep ate off each other's wool. In 1755, towards the end of the month of May, the waters were frozen over in one night to the thickness of an inch and five lines. In 1756, on the 26th of June, snow fell to the depth of a yard, and continued falling through the months of July and August. In the year following it froze very hard towards the end of May and beginning of June, in the south part of the island, which occasioned a great scarcity of grass. These frosts are generally followed by a famine, many examples of which are to be found in the Icelandic chronicles. Besides these calamities, a number of bears annually arrive with the ice, which commit great ravages among the sheep. The Icelanders attempt to destroy these intruders as soon as they get sight of them. Sometimes they assemble together, and drive them back to the ice, with which they often float off again. For want of fire-arms, they are obliged to use spears on these occasions. The government also encourages the destruction of these animals,

Iceland.

Iceland. by paying a premium of 10 dollars for every bear that is killed, and purchasing the skin of him who killed it.

Notwithstanding this dismal picture, however, taken from Von Troil's letters, some tracts of ground, in high cultivation, are mentioned as being covered by the great eruption of lava in 1783. It is possible, therefore, that the above may have been somewhat exaggerated.

Thunder and lightning are seldom heard in Iceland, except in the neighbourhood of volcanoes. Aurora Borealis is very frequent and strong. It most commonly appears in dry weather; though there are not wanting instances of its being seen before or after rain, or even during the time of it. The lunar halo, which prognosticates bad weather, is likewise very frequent here; as are also parheliions, which appear from one to nine in number at a time. These parheliions are observed chiefly at the approach of the Greenland ice, which an intense degree of frost has produced, and the frozen vapours fill the air. Fire-balls, sometimes round and sometimes oval, are observed, and a kind of *ignis fatuus* which attaches itself to men and beasts; and comets are also frequently mentioned in their chronicles. This last circumstance deserves the attention of astronomers.

Iceland, besides all the inconveniences already mentioned, has two very terrible ones, called by the natives *skrida* and *sniofodi*: the name of the first imports large pieces of a mountain tumbling down and destroying the lands and houses which lie at the foot of it: this happened in 1554, when a whole farm was ruined, and thirteen people buried alive. The other word signifies the effects of a prodigious quantity of snow, which covers the top of the mountains, rolling down in immense masses, and doing a great deal of damage: of this there was an instance in 1699, during the night, when two farms were buried, with all their inhabitants and cattle. This last accident Iceland has in common with all very mountainous countries, particularly Switzerland.

3
Account of
the hot
springs of
Iceland
from Von
Troil's Let-
ters.

"Iceland abounds with hot and boiling springs, some of which spout up into the air to a surprising height. All the jets d'eau which have been contrived with so much art, and at such an enormous expence, cannot by any means be compared with these wonders of nature in Iceland. The water-works at Herenhauzen throw up a single column of water of half a quarter of a yard in circumference to a height of about 70 feet; those at the Winterkesten at Cassel throw it up, but in a much thinner column, 130 feet; and the jet d'eau at St Cloud, which is thought the greatest of all the French water-works, casts up a thin column 80 feet into the air; but some springs in Iceland pour forth columns of water several feet in thickness to the height of many fathoms; and many affirm of several hundred feet.

"These springs are unequal in their degrees of heat; but we have observed none under 188 degrees of Fahrenheit's thermometer; in some it is 192, 193, 212, and in one small vein of water 213 degrees. From some the water flows gently, and the spring is then called *laug*, "a bath;" from others it spouts with a great noise, and is then called *HUER*, or *kittel*. It is very common for some of these spouting springs to

close up, and others to appear in their stead. All these hot waters have an incrusting quality, so that we very commonly find the exterior surface from whence it bursts forth covered with a kind of rind, which almost resembles chased work, and which we at first took for lime, but which was afterwards found by Mr Bergman to be of a siliceous or flinty nature. In some places the water tastes of sulphur, in others not; but when drank as soon as it is cold, tastes like common boiled water. The inhabitants use it at particular times for dyeing; and were they to adopt proper regulations, it might be of still greater use. Victuals may also be boiled in it, and milk held over its steam becomes sweet; owing, most probably, to the excessive heat of the water, as the same effect is produced by boiling it a long time over the fire. They have begun to make salt by boiling sea water over it, which when it is refined, is very pure and good. The cows which drink this hot water yield a great deal of milk. Egbert Olafsen relates, that the water does not become turbid when alkali is thrown into it, nor does it change the colour of syrup of violets. Horrebow asserts, that if you fill a bottle at one of the spouting springs, the water will boil over two or three times while the spring throws forth its water; and if corked too soon, the bottle will burst.

"Among the many hot springs to be met with in Iceland, several bear the name of *geyser*: the following is a description of the most remarkable of that name, and in the whole island. It is about two days journey from Hecla, near a farm called *Haukadul*. Here a poet would have an opportunity of painting whatever nature has of beautiful and terrible, united in one picture, by delineating this surprising phenomenon. Represent to yourself a large field, where you see on one side, at a great distance, high mountains covered with ice, whose summits are generally wrapped in clouds, so that their sharp and unequal points become invisible. This loss, however, is compensated by a certain wind, which causes the clouds to sink, and cover the mountain itself, when its summit appears as it were to rest on the clouds. On the other side Hecla is seen, with its three points covered with ice, rising above the clouds, and, with the smoke which ascends from it, forming other clouds at some distance from the real ones: and on another side is a ridge of high rocks, at the foot of which boiling water from time to time issues forth; and further on extends a marsh of about three English miles in circumference, where are 40 or 50 boiling springs, from which a vapour ascends to a prodigious height.— In the midst of these is the greatest spring *geyser*, which deserves a more exact and particular account. In travelling to the place, about an English mile and a half from the *hver*, from which the ridge of rocks still divided us, we hear a loud roaring noise, like the rushing of a torrent precipitating itself from stupendous rocks. We asked our guide what it meant; he answered, it was *geyser* roaring; and we soon saw with our naked eyes what before seemed almost incredible.

"The depth of the opening or pipe from which the water gushes cannot well be determined; for sometimes the water sunk down several fathoms, and some seconds passed before a stone which was thrown into the aperture reached the surface of the water. The opening itself was perfectly round, and 19 feet in diameter,

Iceland.

4
A particular
description
of one
named
Geyser.

Iceland. meter, and terminated in a basin 59 feet in diameter. Both the pipe and the basin were covered with a rough stalaclitic rind, which had been formed by the force of the water: the outermost border of the basin is nine feet and an inch higher than the pipe itself. The water here spouted several times a-day, but always by starts, and after certain intervals. The people who lived in the neighbourhood told us, that they rose higher in cold and bad weather than at other times; and Egbert Olafsen and several others affirm, that it has spouted to the height of 60 fathoms. Most probably they guessed only by the eye, and on that account their calculation may be a little extravagant; and indeed it is to be doubted whether the water was ever thrown up so high, though probably it sometimes mounts higher than when we observed it. The method we took to observe the height was as follows. Every one in company wrote down, at each time that the water spouted, how high it appeared to him to be thrown, and we afterwards chose the medium. The first column marks the spoutings of the water, in the order in which they followed one another; the second, the time when these effusions happened; the third, the height to which the water rose; and the last, how long each spouting of water contained.

N ^o	Time.	Height.	Duration.
1	At VI 42 m.	30 feet.	0 20 seconds.
2	— 51	6	0 20
3	— VII 16	6	0 10
4	— 31	12	0 15
5	— 51	60	0 6
6	— VIII 17	24	0 30
7	— 29	18	0 40
8	— 36	12	0 40

The pipe was now for the first time full of water, which ran slowly into the basin.

9	— IX 25	48	1 10
10	— X 16	24	1 00

“ At 35 minutes after twelve we heard, as it were, three discharges of a gun under ground, which made it shake: the water flowed over immediately, but instantly sunk again. At eight minutes after two, the water flowed over the border of the basin. At 15 minutes after three, we again heard several subterranean noises, though not so strong as before. At 43 minutes after four, the water flowed over very strongly during the space of a minute. In six minutes after, we heard many loud subterraneous discharges, not only near the spring, but also from the neighbouring ridge of rocks, where the water spouted. At 51 minutes after six, the fountain spouted up to the height of 92 feet, and continued to do so for four minutes. After this great effort, it sunk down very low into the pipe, and was entirely quiet during several minutes; but soon began to bubble again: it was not, however, thrown up into the air, but only to the top of the pipe.

“ The force of the vapours which throw up these waters is excessive: it not only prevents the stones which are thrown into the opening from sinking, but even throws them up to a very great height, together with the water. When the basin was full, we placed

ourselves before the sun in such a manner that we could see our shadows in the water; when every one observed round the shadow of his own head (though not round that of the heads of others), a circle of almost the same colours which compose the rainbow, and round this another bright circle. This most probably proceeded from the vapours exhaling from the water.

“ Not far from this place, another spring at the foot of the neighbouring ridge of rocks spouted water to the height of one or two yards each time. The opening through which this water issued was not so wide as the other: we imagined it possible to stop up the hole entirely by throwing large stones into it, and even flattered ourselves that our attempts had succeeded: but, to our astonishment, the water gushed forth in a very violent manner. We hastened to the pipe, and found all the stones thrown aside, and the water playing freely through its former channel. In these large springs the waters were hot in the highest degree, and tasted a little of sulphur; but in other respects it was pure and clear. In the smaller springs of the neighbourhood the water was tainted: in some, it was as muddy as that of a clay-pit: in others, as white as milk; and in some few, as red as blood.

“ Iceland abounds with pillars of basalt, which the lower sort of people imagine have been piled upon each other by the giants, who made use of supernatural force to effect it. They have generally from three to seven sides; and are from four to six feet in thickness, and from 12 to 16 yards in length, without any horizontal divisions. But sometimes they are only from six inches to one foot in height, and they are then very regular, inasmuch that they are sometimes made use of for windows and door-posts. In some places they only peep out here and there among the lava, or more frequently among the tufa; in other places they are quite overthrown, and pieces of broken pillars only make their appearance. Sometimes they extend without interruption for two or three miles in length. In one mountain they have a singular appearance: on the top the pillars lie horizontally, in the middle they are sloping; the lowest are perfectly perpendicular; and in some parts they are bent into a semicircular figure. The matter of the Iceland basalt seems to be the same with that of STAFFA; though in some it is more porous, and inclines to a gray. Some we observed which were of a blackish gray, and composed of several joints. Another time we observed a kind of porous glassy stone, consequently a lava, which was so indistinctly divided, that we were for some time at a loss to determine whether it was basalt or not, though at last we all agreed that it was.

Iron ore is found in some parts of the island, and that beautiful copper ore called *malachites*. Horrebow speaks of native silver. A stratum of sulphur is found near Myvatu from nine inches to two feet in thickness; partly of a brown colour, and partly of a deep orange. Immediately over the sulphur is a blue earth; above that a vitriolic and aluminous one; and beneath the sulphur a reddish bole.

At what time the island of Iceland was first peopled is uncertain. An English colony indeed is said to have been settled there in the beginning of the fifth century;

the basaltic
pillars, &c.

6

History of
the island

Iceland.

century; but of this there are not sufficient proofs. There is, however, reason to suppose that the English and Irish were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accurate description of the island. But of the original inhabitants we cannot pretend to say any thing, as the Icelandic chronicles go no farther back than the arrival of the Norwegians. What they relate is to the following purpose.

Naddodr, a famous pirate, was driven on the coast of Iceland in 861, and named the country *Snio-land*, "Snow land," on account of the great quantities of snow with which he perceived the mountains covered. He did not remain there long: but on his return extolled the country to such a degree, that one Garder Suafarson, an enterprising Swede, was encouraged by his account to go in search of it in 864. He sailed quite round the island, and gave it the name of *Gardalsholmur*, or Garder's island. Having remained in Iceland during the winter, he returned in the spring to Norway, where he described the new-discovered island as a pleasant well-wooded country. This excited a desire in Floke, another Swede, reputed the greatest navigator of his time, to undertake a voyage thither. As the compass was then unknown, he took three ravens on board to employ them on the discovery. By the way he visited his friends at Ferro; and having sailed farther to the northward, he let fly one of his ravens, which returned to Ferro. Some time after, he dismissed the second, which returned to the ship again, as he could find no land. The last trial proved more successful; the third raven took his flight to Iceland, where the ship arrived a few days after. Floke staid here the whole winter with his company; and, because he found a great deal of floating ice on the north side, he gave the country the name of *Iceland*, which it has ever since retained.

When they returned to Norway in the following spring, Floke, and those that had been with him, made a very different description of the country. Floke described it as a wretched place; while one of his companions, named *Thorulfr*, praised it so highly, that he affirmed butter dropped from every plant; which extravagant commendation procured him the name of *Thorulfr-smior*, or Butter-Thorulfr.

From this time there are no accounts of any voyages to Iceland, till Ingolfr and his friend Leifr undertook one in 874. They spent the winter on the island, and determined to settle there for the future. Ingolfr returned to Norway, to provide whatever might be necessary for the comfortable establishment of a colony, and Leifr in the mean time went to assist in the war in England. After an interval of four years, they again met in Iceland, the one bringing with him a considerable number of people, with the necessary tools and instruments for making the country habitable; and the other imported his acquired treasures. After this period many people went there to settle; and, in the space of 60 years, the whole island was inhabited. The tyranny of Harold king of Norway contributed not a little to the population of Iceland; and so great was the emigration of his subjects, that he was at last obliged to issue an order, that no one should sail from

Norway to Iceland without paying four ounces of fine silver to the king.

Iceland.

Besides the Norwegians, new colonies arrived from different nations, between whom wars soon commenced; and the Icelandic histories are full of the accounts of their battles. To prevent these conflicts for the future, a kind of chief was chosen in 928, upon whom great powers were conferred. This man was the speaker in all their public deliberations; pronounced sentence in difficult and intricate cases; decided all disputes; and published new laws, after they had been received and approved of by the people at large: but he had no power to make laws without the approbation and consent of the rest. He therefore assembled the chiefs whenever the circumstances seemed to require it; and after they had deliberated among themselves, he represented the opinion of the majority to the people, whose assent was necessary before it could be considered as a law. His authority among the chiefs and leaders, however, was inconsiderable, as he was chosen by them and retained his place no longer than while he preferred their confidence.

This institution did not prove sufficient to restrain the turbulent spirit of the Icelanders. They openly waged war with each other; and, by their intestine conflicts, so weakened all parties, that the whole became at last a prey to a few arbitrary and enterprising men; who, as is too generally the case, wantonly abused their power to the oppression of their countrymen, and the disgrace of humanity. Notwithstanding these troubles, however, the Icelanders remained free from a foreign yoke till 1261; when the greatest part of them put themselves under the protection of Hakans king of Norway, promising to pay him tribute upon certain conditions agreed on between them; and the rest followed their example in 1264. Afterwards, Iceland, together with Norway, became subject to Denmark. For a long time the care of the island was committed to a governor, who commonly went there once a-year; though, according to his instructions, he ought to have resided in Iceland. As the country suffered incredibly through the absence of its governors, it was resolved a few years ago that they should reside there, and have their seat at Besslestedr, one of the old royal domains. He has under him a bailiff, two laymen, a sheriff, and 21 *siffelmen*, or magistrates who superintend small districts; and almost every thing is decided according to the laws of Denmark.

At the first settlement of the Norwegians in Iceland, ⁷ they lived in the same manner as they had done in their own country, namely, by war and piracy. Their ^{Manners, &c. of the} situation with regard to the kings of Norway, however, soon obliged them to apply to other states, in order to learn as much of the knowledge of government and politics as was necessary to preserve their colony from subjugation to a foreign yoke. For this purpose they often sailed to Norway, Denmark, Sweden, England, and Scotland. The travellers, at their return, were obliged to give an account to their chiefs of the state of those kingdoms through which they passed. For this reason, history, and what related to science, was held in high repute as long as the republican form of government lasted; and the great number of histories

to

Iceland. to be met with in the country, show at least the desire of the Icelanders to be instructed. To secure themselves, therefore, against their powerful neighbours, they were obliged to enlarge their historical knowledge. They likewise took great pains in studying perfectly their own laws, for the maintenance and protection of their internal security. Thus Iceland, at a time when ignorance and obscurity overwhelmed the rest of Europe, was enabled to produce a considerable number of poets and historians. When the Christian religion was introduced, about the end of the 10th century, more were found conversant in the law than could have been expected, considering the extent of the country, and the number of its inhabitants. Fishing was followed among them; but they devoted their attention considerably more to agriculture, which has since entirely ceased.

Two things have principally contributed towards producing a great change both in their character and way of life, viz. the progress of the Christian religion, and their subjection first to Norway, and afterwards to Denmark. For if religion, on one side, commanded them to desist from their ravages and warlike expeditions; the secular power, on the other, deprived them of the necessary forces for the execution of them: and, since this time, we find no farther traces of their heroic deeds, except those which are preserved in their histories.

The modern Icelanders apply themselves to fishing and breeding of cattle. They are middle-sized and well made, though not very strong; and the women are in general ill-featured. Vices are much less common among them, than in other parts where luxury and riches have corrupted the morals of the people. Though their poverty disables them from imitating the hospitality of their ancestors in all respects, yet they continue to show their inclination to it: they cheerfully give away the little they have to spare, and express the utmost joy and satisfaction if you are pleased with their gift. They are uncommonly obliging and faithful, and extremely attached to government. They are very zealous in their religion. An Icelander never passes a river or any other dangerous place, without previously taking off his hat, and imploring the divine protection; and he is always thankful for the protection of the Deity when he has passed the danger in safety. They have an inexpressible attachment to their native country, and are nowhere so happy. An Icelander therefore rarely settles in Copenhagen, though ever such advantageous terms should be offered him. On the other hand, we cannot ascribe any great industry or ingenuity to these people. They work on in the way to which they have all along been accustomed, without thinking of improvements. They are not cheerful in conversation, but simple and credulous; and have no aversion against a bottle, if they can find an opportunity. When they meet together, their chief pastime consists in reading their history. The master of the house makes the beginning, and the rest continue in their turns when he is tired. Some of them know these stories by heart; others have them in print, and others in writing. Besides this, they are great players at chess and cards, but only for their amusement, since they never play for money; which, however, seems to have been formerly in use among

them; since by one of their old laws, a fine is imposed upon those who play for money. Iceland. Their dress.

The modern Icelanders have made very little alteration in their dress from what was formerly in use. The men all wear a linen shirt next to the skin, with a short jacket, and a pair of wide breeches over it. When they travel, another short coat is put over all. The whole is made of coarse black cloth, called *wadmal*; but some wear clothes of a white colour. On their head they wear large three-cornered hats, and on the feet Iceland shoes and worsted stockings. Some of them indeed have shoes from Copenhagen; but, as they are rather too dear for them, they generally make their own shoes, sometimes of the hide of oxen, but more frequently of sheep's leather. They make them by cutting a square piece of leather, rather wider than the length of the foot; this they sew up at the toes and behind at the heel, and tie it on with leather thongs. These shoes are convenient enough where the country is level; but it would be very difficult for us who are not accustomed to walk with them amongst the rocks and stones, though the Icelanders do it with great ease.

The women are likewise dressed in black *wadmal*. They wear a bodice over their shifts, which are sewed up at the bosom; and above this a jacket laced before with long narrow sleeves reaching down to the wrists. In the opening on the side of the sleeve, they have buttons of chased silver, with a plate fixed to each button; on which the lover, when he buys them in order to present them to his mistress, takes care to have his name engraved along with hers. At the top of the jacket a little black collar is fixed, of about three inches broad, of velvet or silk, and frequently trimmed with gold cord. The petticoat is likewise of *wadmal*, and reaches down to the ankles. Round the top of it is a girdle of silver or some other metal, to which they fasten the apron, which is also of *wadmal*, and ornamented at top with buttons of chased silver. Over all this they wear an upper dress nearly resembling that of the Swedish peasants; with this difference, that it is wider at bottom: this is close at the neck and wrists, and a hand's-breadth shorter than the petticoat. It is adorned with a facing down to the bottom, which looks like cut velvet, and is generally wove by the Icelandic women. On their fingers they wear gold, silver, or brass rings. Their head-dress consists of several cloths wrapped round the head almost as high again as the face. It is tied fast with a handkerchief, and serves more for warmth than ornament. Girls are not allowed to wear this head-dress till they are marriageable. At their weddings they are adorned in a very particular manner; the bride wears, close to the face, round her head-dress, a crown of silver gilt. She has two chains round her neck, one of which hangs down very low before, and the other rests on her shoulders. Besides these, she wears a lesser chain, from whence generally hangs a little heart, which may be opened to put some kind of perfume in it. This dress is worn by all the Icelandic women without exception: only with this difference, that the poorer sort have it of coarse *wadmal*, with ornaments of brass; and those that are in easier circumstances have it of broad cloth, with silver ornaments gilt.

Iceland.
Houſes.

The houſes of the Icelanders are very indifferent, but the worſt are ſaid to be on the ſouth ſide of the iſland. In ſome parts they are built of drift-wood, in others of lava, almoſt in the ſame manner as the ſtone-walls we make for incloſures, with moſs ſtuffed between the pieces of lava. In ſome houſes the walls are wainſcotted on the inſide. The roof is covered with ſods, laid over rafting, or ſometimes over the ribs of whales; the walls are about three yards high, and the entrance ſomewhat lower. Inſtead of glaſs, the windows are made of the chorion and annios of ſheep, or the membranes which ſurround the womb of the ewe. Theſe are ſtretched on a hoop, and laid over a hole in the roof. In the poorer ſort of houſes they employ for the windows the inner membrane of the ſtomach of animals, which is leſs transparent than the others.

10
Diet.

As the iſland of Iceland produces no kind of grain, the inhabitants of conſequence have no bread but what is imported; and which being too dear for common uſe, is reſerved for weddings and other entertainments. The following liſt of their viands is taken from Troil's Letters.

" 1. Flour of *ſalgras*, (*lichen iſlandicus*), or rock-graſs. The plant is firſt waſhed, and then cut into ſmall pieces by ſome; though the greater number dry it by fire or in the ſun, then put it into a bag in which it is well beaten, and laſtly work it into a flour by ſtamping.

" 2. Flour of *kompſygr*, (*polygonum biſtorta*), is prepared in the ſame manner, as well as the two other ſorts of wild corn *melur* (*arundo arenaria*, and *arundo foliorum lateribus convolutis*), by ſeparating it from the chaff, pounding, and laſtly grinding it.

" 3. *Surt ſmoer*, (ſour butter). The Icelanders ſeldom make uſe of freſh or ſalt butter, but let it grow ſour before they eat it. In this manner it may be kept for 20 years, or even longer; and the Icelanders look upon it as more wholeſome and palatable than the butter uſed among other nations. It is reckoned better the older it grows; and one pound of it then is valued as much as two of freſh butter.

" 3. *Striug*, or whey boiled to the conſiſtence of ſour milk, and preſerved for the winter.

" 4. Fiſh of all kinds, both dried in the ſun and in the air, and either ſalted or frozen. Thoſe prepared in the laſt manner are preferred by many.

" 5. The fleſh of bears, ſheep, and birds, which is partly ſalted, partly hung or ſmoked, and ſome preſerved in caſks with ſour or fermented whey poured over it.

" 6. *Mifoſt*, or whey boiled to cheeſe, which is very good. But the art of making other kinds of good cheeſe is loſt, though ſome tolerably palatable is ſold in the eaſt quarter of Iceland.

" 7. *Beina ſtriug*, bones and cartilages of beef and mutton, and likewiſe bones of cod, boiled in whey till they are quite diſſolved; they are then left to ferment, and are eaten with milk.

" 8. *Skyr*. The curds from which the whey is ſqueezed are preſerved in caſks or other veſſels; they are ſometimes mixed with black crow-berries or juniper-berries, and are likewiſe eaten with new milk.

" 9. *Syra*, is ſour whey kept in caſks, and left to ferment; which, however, is not reckoned fit for uſe till a year old.

" 10. *Blanda*, is a liquor made of water, to which a twelfth part of ſyra is added. In winter, it is mixed with the juice of thyme and of the black crow-berries.

" 11. They likewiſe eat many vegetables, ſome of which grow wild, and ſome are cultivated; alſo ſhell-fiſh and muſhrooms."

The Icelanders in general eat three meals a-day, at ſeven in the morning, two in the afternoon, and nine at night. In the morning and evening they commonly eat curds mixed with new milk, and ſometimes with juniper or crow-berries. In ſome parts, they alſo have pottage made of rock-graſs, which is very palatable, or curdled milk boiled till it becomes of a red colour, or new milk boiled a long time. At dinner, the food conſiſts of dried fiſh, with plenty of ſour butter; they alſo ſometimes eat freſh fiſh, and, when poſſible, a little bread and cheeſe with them. It is reported by ſome, that they do not eat any fiſh till it is quite rotten; this report perhaps proceeds from their being fond of it when a little tainted: they however frequently eat fiſh which is quite freſh, though, in the ſame manner as the reſt of their food, often without ſalt.

The common beverage is milk, either warm from the cow or cold, and ſometimes boiled: they likewiſe uſe butter-milk with or without water. On the coaſts they generally drink *blanda* and ſour milk; which is ſold after it is ſkimmed at two fifths of a rixdollar per caſk: ſome likewiſe ſend for beer from Copenhagen, and ſome brew their own. A few of the principal inhabitants alſo have claret and coffee. The common people ſometimes drink a kind of tea, which they make from the leaves of the *dryas octopetala*, and the *veronica officinalis*.

On the coaſts the men employ themſelves in fiſh-¹¹Employ-
ing, both ſummer and winter. On their return home, ment, ma-
when they have drawn and cleaned their fiſh, they give nufactures,
them to their wives, whoſe care it is to dry them. &c.
In the winter, when the inclemency of the weather prevents them from fiſhing, they are obliged to take care of their cattle, and ſpin wool. In ſummer, they mow the graſs, dig turf, provide fuel, go in ſearch of ſheep and goats that were gone aſtray, and kill cattle. They prepare leather with the *ſpiraea ulmaria* inſtead of bark. Some few work in gold and ſilver; and others are inſtructed in mechanics, in which they are tolerable proficient. The women prepare the fiſh, take care of the cattle, manage the milk and wool, ſew, ſpin, and gather eggs and down. When they work in the evening, they uſe, inſtead of an hour-glaſs, a lamp with a wick made of epilobium dipt in train oil, which is contrived to burn four, ſix, or eight hours.

Among the common people of Iceland, time is not reckoned by the courſe of the ſun, but by the work they have done, and which is preſcribed by law. According to his preſcription, a man is to mow as much hay in one day as grows on 30 fathoms of manured ſoil, or 40 fathoms of land which has not been manured; or he is to dig 700 pieces of turf eight feet long and three broad. If as much ſnow falls as reaches to the horſes bellies, a man is required daily to clear a piece of ground ſufficient for 100 ſheep. A woman is to rake together as much hay as three men can mow, or to weave three yards of wadmál a-day.

The

Iceland.

Iceland.

The wages of a man are fixed at four dollars and 12 yards of wadmal; and those of a woman at two dollars and five yards of wadmal. When men are sent a-fishing out of the country, there is allowed to each man, by law, from the 25th of September to the 14th of May, six pounds of butter, and 18 pounds of dried fish every week. This may seem to be too great an allowance; but it must be remembered that they have nothing else to live upon. When they are at home, and can get milk, &c. every man receives only five pounds of dried fish and three quarters of a pound of butter a-week.

12

Diseases.

The food and manner of life of the Icelanders by no means contribute to their longevity. It is very rare indeed to see an inhabitant of Iceland exceed the age of 50 or 60; and the greater part are attacked by grievous diseases before middle age. Of these the scurvy and elephantiasis or leprosy are the worst. They are also subject to the gout in their hands, owing to their frequent employment in fishing, and handling the wet fishing-tackle in cold weather. St Anthony's fire, the jaundice, pleurisy, and lowness of spirits, are frequent complaints in this country. The small-pox also is exceedingly fatal, and not long ago destroyed 16,000 persons. By these diseases, and the frequent famines with which the country has been afflicted, the inhabitants are reduced to a much smaller number than they formerly were, inasmuch that it is computed they do not in all exceed 60,000.

13

Commerce and revenue.

The exports of Iceland consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox-furs of various colours, eider down, feathers, and formerly sulphur; but there is no longer a demand for this mineral. On the other hand, the Icelanders import timber, fishing-lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, a little silk, and a few other necessaries, as well as superfluities for the better sort. The whole trade of Iceland is engrossed by a monopoly of Danes, indulged with an exclusive charter. This company maintains factories at all the harbours of Iceland, where they exchange their foreign goods for the merchandise of the country; and as the balance is in favour of the Icelanders, pay the overplus in Danish money, which is the only current coin in this island. All their accounts and payments are adjusted according to the number of fish: two pounds of fish are worth two skillings in specie, and 48 fish amount to one rixdollar. A Danish crown is computed at 30 fish: what falls under the value of 12 fish cannot be paid in money; but must be bartered either for fish or roll-tobacco, an ell of which is equal to one fish. The weights and measures of the Icelanders are nearly the same with those used in Denmark. The Icelanders being neither numerous nor warlike, and altogether unprovided with arms, ammunition, garrisons, or fleets, are in no condition to defend themselves from invasion, but depend entirely on the protection of his Danish majesty, to whom they are subject. The revenues which he draws from this island consist of the income of divers estates, as royal demesne, amounting to about 8000 dollars per annum; of the money paid by the company for an exclusive trade, to the value of 20,000 dollars;

and of a fixed proportion in the tythes of fish paid in some particular districts.

Iceland.

14
Volcanoes
of Iceland.

Iceland is noted for the volcanoes with which it abounds, as already mentioned, and which seem to be more furious than any yet discovered in the other parts of the globe. Indeed, from the latest accounts, it would seem that this miserable country were little other than one continued volcano. Mount Hecla has been commonly supposed to be the only burning mountain, or at least the principal one, in the island: (see HECLA). It has indeed been more taken notice of than many others of as great extent, partly from its having had more frequent eruptions than any single one, and partly from its situation, which exposes it to the sight of ships sailing to Greenland and North America. But in a list of eruptions published in the appendix to Pennant's Arctic Zoology, it appears, that out of 51 remarkable ones, only one third have proceeded from Hecla, the other mountains it seems being no less active in the work of destruction than this celebrated one. These eruptions take place in the mountains covered with ice, which the inhabitants call *Jokuls*. Some of these, as appears from a large map of Iceland made by order of his Danish majesty in 1734, have been swallowed up. Probably the great lakes met with in this country may have been occasioned by the sinking of such mountains, as several instances of a similar nature are to be met with in other parts of the world. The great Icelandic lake called *Myvatn* may probably have been one. Its bottom is entirely formed of lava, divided by deep cracks, which shelter during winter the great quantity of trout which inhabit this lake. It is now only 30 feet deep, but originally was much deeper; being nearly filled up in the year 1718 by an eruption of the great mountain *Krafla*. The fiery stream took its course towards *Myvatn*, and ran into it with an horrid noise, which continued till the year 1730.

"The mountains of Iceland (says Mr Pennant) are of two kinds, primitive and posterior. The former consist of strata usually regular, but sometimes confused. They are formed of different sorts of stone without the least appearance of fire. Some are composed of sand and free-stone, petrosilex or chert, slaty or fissile stone, and various kinds of earth or bole, and steatite; different sorts of breccia or conglutinated stones; jaspers of different kinds, Iceland crystal; the common rhomboid spathum, chalcedonies stratified, and botryoid; zeolites of the most elegant kinds; crystals, and various other substances that have no relation to volcanoes. These primitive mountains are those called *Jokuls*, and are higher than the others. One of them, called *Aesian* or *Rias*, is 6000 feet high. It seems to be composed of great and irregular rocks of a dark gray colour, piled on each other. Another, called *Enneberg*, is about 3000 feet high; the *Snæfeld Jokul*, 2287 yards; the *Snæfeldnas* or promontory of *Snæfeld* is from 300 to 400 fathoms. *Harnstrand* or the coast by the north Cape Nord is very high, from 300 to 400 fathoms. The rocks of *Drango* are seven in number, of a pyramidal figure, rising out of the sea at a small distance from the cliffs, four of which are of a vast height, and have a most magnificent appearance.

"Eastward from the *Snæfeld* begins the Eisberge, soaring

Iceland. soaring to a vast height; many parts of which have felt the effects of fire, and in some of the melted rocks are large cavities. *Budda-lekkur*, a rock at one end of this mountain, is also volcanic, and has in it a great cavern hung with *stalactite*. The name of *Solva-hamar* is given to a tremendous range of volcanic rocks, composed entirely of slags, and covered in the season with sea-fowl. It would be endless, however, to mention all the places which bear the marks of fire in various forms, either by having been vitrified, changed into a fiery colour, ragged and black, or bear the marks of having run for miles in a sloping course towards the sea."

These volcanoes, though so dreadful in their effects, seldom begin to throw out fire without giving warning. A subterraneous rumbling noise heard at a considerable distance, as in other volcanoes, precedes the eruption for several days, with a roaring and cracking in the place from whence the fire is about to burst forth; many fiery meteors are observed, but generally unattended with any violent concussion of the earth, though sometimes earthquakes, of which several instances are recorded, have accompanied these dreadful conflagrations. The drying up of small lakes, streams, and rivulets, is also considered as a sign of an impending eruption; and it is thought to hasten the eruption when a mountain is so covered with ice, that the holes are stopped up through which the exhalations formerly found a free passage. The immediate sign is the bursting of the mass of ice with a dreadful noise; flames then issue forth from the earth, and lightning and fire balls from the smoke; stones, ashes, &c. are thrown out to vast distances. Egbert Olafsen relates, that, in an eruption of *Kattle gja* in 1755, a stone weighing 290 pounds was thrown to the distance of 24 English miles. A quantity of white pumice stones is thrown up by the boiling waters; and it is conjectured with great probability, that the latter proceeds from the sea, as a quantity of salt, sufficient to load several horses, has frequently been found after the mountain has ceased to burn.

To enumerate the ravages of so many dreadful volcanoes, which from time immemorial have contributed to render this dreary country still less habitable than it is from the climate, would greatly exceed our limits. It will be sufficient to give an account of that which happened in 1783, and which from its violence seems to have been unparalleled in history.

Its first signs were observed on the 1st of June by a trembling of the earth in the western part of the province of *Skaptarfjall*. It increased gradually to the 11th, and became at last so great that the inhabitants quitted their houses, and lay at night in tents on the ground. A continual smoke or steam was perceived rising out of the earth in the northern and uninhabited parts of the country. Three *fire-spouts*, as they were called, broke out in different places, one in *Ulfarsdal*, a little to the east of the river *Skapta*; the other two were a little to the westward of the river called *Ilverfisflot*. The river *Skapta* takes its rise in the north-east, and running first westward, it turns to the south, and falls into the sea in a south-east direction. Part of its channel is confined for about 24 English miles in length, and is in some places 200 fathoms deep, in others 100 or 150, and its breadth in some

Iceland. places 100, 50, or 40 fathoms. Along the whole of this part of its course the river is very rapid, though there are no considerable cataracts or falls. There are several other such confined channels in the country, but this is the most considerable.

The three fire-spouts, or streams of lava, which had broke out, united into one, after having risen a considerable height into the air, arriving at last at such an amazing altitude as to be seen at the distance of more than 200 English miles; the whole country, for double that distance, being covered with a smoke or steam not to be described.

On the 8th of June this fire first became visible. Vast quantities of sand, ashes, and other volcanic matters were ejected, and scattered over the country by the wind, which at that time was very high. The atmosphere was filled with sand, brimstone, and ashes, in such a manner as to occasion continual darkness; and considerable damage was done by the pumice stones which fell, red hot, in great quantities. Along with these a tenacious substance like pitch fell in vast quantity; sometimes rolled up like balls, at other times like rings or garlands, which proved no less destructive to vegetation than the other. This shower having continued for three days, the fire became very visible, and at last arrived at the amazing height already mentioned. Sometimes it appeared in a continued stream, at others in flashes or flames seen at the distance of 30 or 40 Danish miles (180 or 240 of ours), with a continual noise like thunder, which lasted the whole summer.

The same day that the fire broke out there fell a vast quantity of rain, which running in streams on the hot ground tore it up in large quantities, and brought it down upon the lower lands. This rain-water was much impregnated with acid and other salts, so as to be highly corrosive, and occasion a painful sensation when it fell on the hands or face. At a greater distance from the fire the air was excessively cold. Snow lay upon the ground three feet deep in some places; and in others there fell great quantities of hail, which did very much damage to the cattle and every thing without doors. Thus the grass and every kind of vegetation in those places nearest the fire was destroyed, being covered with a thick crust of sulphureous and foamy matter. Such a quantity of vapour was raised by the contest of the two adverse elements, that the sun was darkened and appeared like blood, the whole face of nature seeming to be changed; and this obscurity seems to have reached as far as the island of Britain; for during the whole summer of 1783, an obscurity reigned throughout all parts of this island; the atmosphere appearing to be covered with a continual haze, which prevented the sun from appearing with his usual splendour.

The dreadful scene above described lasted in Iceland for several days; the whole country was laid waste, and the inhabitants fled everywhere to the remotest parts of their miserable country, to seek for safety from the fury of this unparalleled tempest.

On the first breaking out of the fire, the river *Skapta* was considerably augmented, on the east side of which one of the fire spouts was situated; and a similar overflow of water was observed at the same time in the great river *Piorfa*, which runs into the sea a

little

desolated
by an eruption
in
1783.

Iceland. little to the eastward of a town called *Orrebakka*, and into which another river called *Tuna*, after having run through a large tract of barren and uncultivated land, empties itself. But on the 11th of June the waters of the Skapta were lessened, and in less than 24 hours totally dried up. The day following, a prodigious stream of liquid and red hot lava, which the fire-spout had discharged, ran down the channel of the river. This burning torrent not only filled up the deep channel above mentioned, but, overflowing the banks of it, spread itself over the whole valley, covering all the low grounds in its neighbourhood; and not having any sufficient outlet to empty itself by, it rose to a vast height, so that the whole adjacent country was overflowed, insinuating itself between the hills, and covering some of the lower ones. The hills here are not continued in a long chain or series, but are separated from one another, and detached, and between them run little rivulets or brooks; so that, besides filling up the whole valley in which the river *Skapta* ran, the fiery stream spread itself for a considerable distance on each side, getting vent between the above mentioned hills, and laying all the neighbouring country under fire.

The spouts still continuing to supply fresh quantities of inflamed matter, the lava took its course up the channel of the river, overflowing all the grounds above, as it had done those below the place whence it issued. The river was dried up before it, until at last it was stopped by the hill whence the *Skapta* took its rise. Finding now no proper outlet, it rose to a prodigious height, and overflowed the village of *Buland*, confounding the houses, church, and every thing that stood in its way: though the high ground on which this village stood seemed to ensure it from any danger of this kind.

The fiery lake still increasing, spread itself out in length and breadth for about 36 English miles; and having converted all this tract of land into a sea of fire, it stretched itself toward the south, and getting out again by the river *Skapta*, rushed down its channel with great impetuosity. It was still confined between the narrow banks of that river for about six miles (English); but coming at last into a more open place, it poured forth in prodigious torrents with amazing velocity and force; spreading itself now towards the south, tearing up the earth, and carrying on its surface flaming woods and whatsoever it met with. In its course it laid waste another large district of land. The ground where it came was cracked, and sent forth great quantities of steam long before the fire reached it; and every thing near the lake was either burnt up or reduced to a fluid state. In this situation matters remained from the 12th of June to the 13th of August; after which the fiery lake no longer spread itself, but nevertheless continued to burn; and when any part of the surface acquired a crust by cooling, it was quickly broken by the fire from below; and tumbling down among the melted substance, was rolled and tossed about with prodigious noise and crackling; and in many parts of its surface, small spouts or at least ebullitions, were formed, which continued for some length of time.

In other directions this dreadful inundation proved

no less destructive. Having run through the narrow Iceland part of the channel of *Skapta* as early as the 12th of June, it stretched out itself towards the west and south-west, overflowing all the flat country, and its edge being no less than 70 fathoms high at the time it got out of the channel of the river. Continuing its destructive course, it overflowed a number of villages, running in every direction where it could find a vent. In one place it came to a great cataract of the river *Skapta*, about 14 fathoms in height, over which it was precipitated with tremendous noise, and thrown in great quantities to a very considerable distance. In another place it stopped up the channel of a large river, filled a great valley, and destroyed two villages by approaching only within 100 fathoms of them. Others were overflowed by inundations of water proceeding from the rivers which had been stopped in their courses; until at last all the passages on the south, east, and west; being stopped, and the spouts still sending up incredible quantities of fresh lava, it burst out to the north and north-east, spreading over a tract of land 48 miles long and 36 broad. Here it dried up the rivers *Tuna* and *Axajydri*; but even this vast effusion being insufficient to exhaust the subterraneous resources of liquid fire, a new branch took its course for about eight miles down the channel of the river *Ilwerfsfiot*, when coming again to an open country, it formed what our author calls a *small* lake of fire, about twelve miles in length and six in breadth. At last, however, this branch also stopped on the 16th of August; the fiery fountains ceased to pour forth new supplies, and this most astonishing eruption came to a period.

The whole extent of ground covered by this dreadful inundation was computed at no less than 90 miles long and 42 in breadth; the depth of the lava being from 16 to 20 fathoms. Two rivers were dried up, 20 or 21 villages were destroyed, and 224 people lost their lives. The extent above mentioned, however, is that only on the south, east and west; for that towards the north being over uninhabited land, where no body cared to venture themselves, was not exactly known. Some hills were covered by this lava: others were melted down by its heat; so that the whole had the appearance of a sea of red-hot and melted metal.

After this eruption two new islands were thrown up from the bottom of the sea. One, about three miles in circumference, and about a mile in height, made its appearance in the month of February 1784, where there was formerly 100 fathoms water. It was about 100 miles south-west from Iceland, and 48 from a cluster of small islands called *Gierfugal*. It continued for some time to burn with great violence, sending forth prodigious quantities of pumice-stones, sand, &c. like other volcanoes. The other lay to the north-west, between Iceland and Greenland. It burnt day and night, without intermission for a considerable time; and was also very high, and larger than the former. Since that time, however, one or both of these islands have been swallowed up.

All the time of this great eruption, and for a considerable time after, the whole atmosphere was loaded with smoke, steam, and sulphureous vapours. The sun was sometimes wholly invisible; and when it could be seen was of a reddish colour. Most of the fisheries

Iceland. ries were destroyed; the banks where the fish used to resort being so changed, that the fishermen could not know them again; and the smoke was so thick, that they could not go far out to sea. The rain water, falling through this smoke and steam, was so impregnated with salt and sulphureous matter, that the hair and even the skins of the cattle were destroyed; and the whole grass of the island was covered with foot and pitchy matter, that what had escaped the destructive effects of the fire became poisonous; so that the cattle died for want of food, or perished by eating those unwholesome vegetables. Nor were the inhabitants in a much better situation, many of them having lost their lives by the poisonous qualities of the smoke and steam with which the whole atmosphere was filled; particularly old people, and such as had any complaint in the breast and lungs.

Before the fire broke out in Iceland, there is said to have been a very remarkable eruption in the uninhabited parts of Greenland; and that in the northern parts of Norway, opposite to Greenland, the fire was visible for a long time. It was also related, that when the wind was in the north, a great quantity of ashes, pumice, and brimstone, fell upon the north and west coasts of Iceland, which continued for the whole summer whenever the wind was in that quarter; and the air was always very much impregnated with a thick smoke and sulphureous smell.

During the fall of the sharp rain formerly mentioned, there was observed at Trondheim, and other places in Norway, and likewise at Faw, an uncommon fall of sharp and salt rain, which totally destroyed the leaves of the trees, and every vegetable it fell upon, by scorching them up, and causing them to wither. A considerable quantity of ashes, sand, and other volcanic matters, fell at Faro, which covered the whole surface of the ground whenever the wind blew from Iceland, though the distance between the two places is not less than 430 miles. Ships that were sailing betwixt Copenhagen and Norway were frequently covered with ashes and sulphurous matter, which stuck to the masts, sails, and decks, besmearing them all over with a black and pitchy substance. In many parts of Holland, Germany, and other northern countries, a sulphurous vapour was observed in the air, accompanied with a thick smoke, and in some places a light gray-coloured substance fell upon the earth every night; which, by yielding a bluish flame when thrown into the fire, evidently showed its sulphureous nature. On those nights in which this substance fell in any quantity, there was little or no dew observed. These appearances continued, more or less, all the months of July, August and September.

16
Vhorke-
lyn's ac-
count of
the ancient
state of the
island.

Some curious particulars relative to the ancient state of this island have lately been published by a Mr Vhorke-lyn, a native of the country. From his work it appears that Iceland, for a very considerable space of time, viz. from the beginning of the 10th to the middle of the 13th century, was under a republican form of government. At first the father, or head of every family, was an absolute sovereign; but in the progress of population and improvement, it became necessary to form certain regulations for the settlement of disputes concerning the frontiers of different estates. For this purpose the heads of the families concerned af-

Iceland. fsembled themselves, and formed the outlines of a republic. In the mean time they carried on a prosperous trade to different parts; sending ships even to the Levant, and to Constantinople, at that time celebrated as the only seat of literature and humanity in the world. Deputies were likewise sent from this island over land to that capital, for the improvement of their laws and civilization; and this a whole century before the first crusade. In these ancient Icelandic laws, therefore, we meet with evident traces of those of the Greeks and Romans. For example, besides a body of written laws which were written every third year to the people, they had two men chosen annually by the heads of families, with consular power, not only to enforce the laws then in being, but when these proved deficient, to act as necessity required.

These laws do not appear to have inflicted capital punishments upon any person. Murderers were banished to the *wood*; that is, to the interior and uncultivated parts of the island: where no person was allowed to approach them within a certain number of fathoms. In cases of banishment for lesser crimes, the friends of the offender were allowed to supply him with necessaries. The culprit, however, might be killed by any person who found him without his bounds; and he might even be hunted and destroyed in his sanctuary, provided he did not withdraw himself from the island within a twelvemonth after his sentence, which it was supposed he might accomplish by means of the annual arrival and departure of ships. Every man's person was free until he had forfeited his rights by some crime against society; and so great was their respect for independence, that great indulgence was allowed for the power of passion. If any provoking word or behaviour had been used, no punishment was inflicted on the party who resented it, even though he should have killed his adversary.

By the laws of Iceland, the poor were committed to the protection of their nearest kindred, who had a right to their labour as far as they were able to work, and afterwards to indemnification if the poor person should acquire any property. Children were obliged to maintain their parents in their old age; but if the latter had neglected to give them good education, they were absolved from this duty.

While the republic of Iceland continued free and independent, ships were sent from the island to all parts of the world. Till very lately, however, not a ship belonged to it, the little commerce it enjoyed being monopolized by a Danish company, until in 1786 it was laid open to all the subjects of Denmark. "There is at present (says Mr Pennant *) a revival of the cod fishery on the coast of Iceland from our kingdom. About a dozen of vessels have of late sailed from the isle of Thanet, and a few from other parts of Great Bri-
* *Appendix to Art. Fish Zoology, p. 19.*

tain. They are either sloops or brigs from 50 to 80 tons burden. A lug-sail boat, such as is used in the herring fishery, sailed last season from Yarmouth thus equipped. The crew consisted of five men from the town, and five more taken in at the Orkneys. They had twelve lines of 120 fathoms each, and 200 or 300 hooks; six heading knives, twelve gutting and twelve splitting knives. They take in 18 tons of salt at Leith, at the rate of three tons to every thousand fish; of which six or seven thousand is a load for a vessel of this

Iceland
Ichoglans.

this kind. They go to sea about the middle of April; return by the Orkneys to land the men; and get into their port in the latter end of August or beginning of September. Pytheas says, that Iceland lies six days sailing from Great Britain. A vessel from Yarmouth was, in the last year, exactly that time in its voyage from the Orkneys to Iceland. With a fair wind it might be performed in far less time; but the winds about the Ferroe isles are generally changeable.

ICELAND AGATE; a kind of precious stone met with in the islands of Iceland and Ascension, employed by the jewellers as an agate, thought too soft for the purpose. It is supposed to be a volcanic product; being solid, black, and of a glassy texture. When held between the eye and the light, it is semitransparent and greenish like the glass bottles which contain much iron. In the islands which produce it, such large pieces are met with that they cannot be equalled in any glass-house.

ICENI, the ancient name of the people of Suffolk, Norfolk, Cambridgeshire, and Huntingdonshire, in England.

ICH-DIEN. See *HERALDRY*, chap. iv. sect. 2.

ICHNEUMON, in *Zoology*. See *VIVERRA*, *MAMMALIA Index*.

ICHNEUMON, is also the name of a genus of flies of the hymenoptera order. See *ENTOMOLOGY Index*.

ICHNOGRAPHY, in *Perspective*, the view of any thing cut off by a plane, parallel to the horizon, just at the base of it.—The word is derived from the Greek *ιχνη*; *footstep*, and *γραφο* *I write*, as being a description of the footsteps or traces of a work.

Among painters it signifies a description of images or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and ancient pieces of miniature.

ICHNOGRAPHY, in *Architecture*, is a transverse or horizontal section of a building, exhibiting the plot of the whole edifice, and of the several rooms and apartments in any story; together with the thickness of the walls and partitions; the dimensions of the doors, windows, and chimneys; the projections of the columns and piers, with every thing visible in such a section.

ICHOGLANS, the grand signior's pages serving in the seraglio. These are the children of Christian parents, either taken in war, purchased, or sent in presents from the viceroys and governors of distant provinces: they are the most sprightly, beautiful, and well-made that can be met with: and are always reviewed and approved of by the grand signior himself before they are admitted into the seraglios of Pera, Constantinople, or Adrianople, being the three colleges where they are educated, or fitted for employment, according to the opinion the court entertains of them.

ICHOR, properly signifies a thin watery humour like serum; but is sometimes used for a thicker kind flowing from ulcers, called also *sanies*.

ICHTHYOCOLLA, *ISINGLASS*, a preparation from the fish known by the name of *huso*. See *ACCEPTENSER*. The word is Greek, formed of *ιχθυος*; *fish*, and *κόλλα* *glue*.—The method of making isinglass was long a secret in the hands of the Russians; but hath lately been discovered, and the following account of it published by Humphrey Jackson, Esq. in the 63d volume of the *Philosophical Transactions*.

"All authors who have hitherto delivered processes for making ichthyocola, fish-glué, or isinglass, have greatly mistaken both its constituent matter and preparation.

"To prove this assertion, it may not be improper to recite what Pomet says upon the subject, as he appears to be the principal author whom the rest have copied. After describing the fish, and referring to a cut engraved from an original in his custody, he says: 'As to the manner of making the isinglass, the finewy parts of the fish are boiled in water till all of them be dissolved that will dissolve; then the gluey liquor is strained, and set to cool. Being cold, the fat is carefully taken off, and the liquor itself boiled to a just consistency, then cut to pieces, and made into a twist, bent in form of a crescent, as commonly sold; then hung upon a string, and carefully dried.'

"From this account, it might be rationally concluded, that every species of fish which contained gelatinous principles would yield isinglass: and this parity of reasoning seems to have given rise to the hasty conclusions of those who strenuously vouch for the extraction of isinglass from sturgeon; but as that fish is easily procurable, the negligence of ascertaining the fact by experiment seems inexcusable.

"In my first attempt to discover the constituent parts and manufacture of isinglass, relying too much upon the authority of some chemical authors whose veracity I had experienced in many other instances, I found myself constantly disappointed. Glue, not isinglass, was the result of every process; and although, in the same view, a journey to Russia proved fruitless, yet a steady perseverance in the research proved not only successful as to this object, but, in the pursuit, to discover a resinous matter plentifully procurable in the British fisheries, which has been found by ample experience to answer similar purposes. It is now no longer a secret, that our (A) lakes and rivers in North America are stocked with immense quantities of fish, said to be the same species with those in Muscovy, and yielding the finest isinglass; the fisheries whereof, under due encouragement would doubtless supply all Europe with this valuable article.

"No artificial heat is necessary to the production of isinglass, neither is the matter dissolved for this purpose; for,

Ichor,
Ichthyocola

(A) As the lakes of North America lie nearly in the same latitude with the Caspian sea, particularly Lake Superior, which is said to be of greater extent, it was conjectured they might abound with the same sorts of fish; and in consequence of public advertisements distributed in various parts of North America, offering premiums for the sounds of sturgeon and other fish, for the purpose of making isinglass, several specimens of fine isinglass, the produce of fish taken in these parts, have been lately sent to England, with proper attestations as to the unlimited quantity which may be procured.

Ichthyocolla.

for, as the continuity of its fibres would be destroyed by solution, the mass would become brittle in drying, and snap short asunder, which is always the case with glue, but never with isinglass. The latter, indeed, may be resolved into glue with boiling water; but its fibrous re-composition would be found impracticable afterwards, and a fibrous texture is one of the most distinguishing characteristics of genuine isinglass.

"A due consideration that an imperfect solution of isinglass, called *fining* by the brewers, possessed a peculiar property of clarifying malt-liquors, induced me to attempt its analysis in cold subacid menstrua. One ounce and a half of good isinglass, steeped a few days in a gallon of stale beer, was converted into good fining, of a remarkably thick consistence: the same quantity of glue, under similar treatment, yielded only a mucilaginous liquor, resembling diluted gum-water, which, instead of clarifying beer, increased both its tenacity and turbidness, and communicated other properties in no respect corresponding with those of genuine fining. On commixing three spoonfuls of the solution of isinglass with a gallon of malt liquor, in a tall cylindrical glass, a vast number of curdly masses became presently formed, by the reciprocal attraction of the particles of isinglass and the feculencies of the beer, which, increasing in magnitude and specific gravity, arranged themselves accordingly and fell in a combined state to the bottom, through the well-known laws of gravitation; for, in this case, there is no elective attraction, as some have imagined, which bears the least affinity with what frequently occurs in chemical decompositions.

"If what is commercially termed *long* or *short stapled isinglass* be steeped a few hours in fair cold water, the entwined membranes will expand, and reassume their original beautiful (B) hue, and, by a dexterous address, may be perfectly unfolded. By this simple operation, we find that isinglass is nothing more than certain membranous parts of fishes, divested of their native mucosity, rolled and twisted into the forms above-mentioned, and dried in open air.

"The sounds, or air-bladders, of fresh water fish in general, are preferred for this purpose, as being the most transparent, flexible, delicate substances. These constitute the finest sorts of isinglass; those called *book* and *ordinary staple* are made of the intestines, and probably of the peritonæum of the fish. The belluge yields the greatest quantity, as being the largest and most plentiful fish in the Muscovy rivers; but the sounds of all fresh-water fish yield, more or less, fine isinglass, particularly the smaller sorts, found in prodigious quantities in the Caspian sea, and several hundred miles beyond Astracan, in the Wolga, Yaik, Don, and even as far as Siberia, where it is called *kle* or *kla* by the natives, which implies a glutinous matter; it is the basis of the Russian glue, which is preferred to all other kinds for its strength.

"The sounds, which yield the finer isinglass, consist of parallel fibres, and are easily rent longitudinally; but the ordinary sorts are found composed of double membranes, whose fibres cross each other obliquely, re-

sembling the coats of a bladder: hence the former are more readily pervaded and divided with subacid liquors; but the latter, through a peculiar kind of interwoven texture, are with great difficulty torn asunder, and long resist the power of the same menstruum; yet, when duly resolved, are found to act with equal energy in clarifying liquors.

"Isinglass receives its different shapes in the following manner:

"The parts of which it is composed, particularly the sounds, are taken from the fish while sweet and fresh, slit open, washed from their slimy *fordes*, divested of every thin membrane which envelopes the sound, and then exposed to stiffen a little in the air. In this state, they are formed into rolls about the thickness of a finger, and in length according to the intended size of the staple: a thin membrane is generally selected for the centre of the roll, round which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inwards. The due dimensions being thus obtained, the two ends of what is called *short staple* are pinned together with a small wooden peg; the middle of the roll is then pressed a little downwards, which gives it the resemblance of a heart-shape; and thus it is laid on boards, or hung up in the air to dry. The sounds, which compose the long-staple, are longer than the former; but the operator lengthens this sort at pleasure, by interfolding the ends of one or more pieces of the sound with each other. The extremities are fastened with a peg, like the former; but the middle part of the roll is bent more considerably downwards, and, in order to preserve the shape of the three obtuse angles thus formed, a piece of round stick, about a quarter of an inch diameter, is fastened in each angle with small wooden pegs, in the same manner as the ends. In this state, it is permitted to dry long enough to retain its form, when the pegs and sticks are taken out, and the drying completed; lastly, the pieces of isinglass are colligated in rows, by running pack-thread through the peg-holes, for convenience of package and exportation.

"The membranes of the *book* sort, being thick and refractory, will not admit a similar formation with the preceding; the pieces, therefore, after their sides are folded inwardly, are bent in the centre, in such manner that the opposite sides resemble the cover of a book, from whence its name; a peg being run across the middle, fastens the sides together, and thus it is dried like the former. This sort is interleaved, and the pegs run across the ends, the better to prevent its unfolding.

"That called *cake-isinglass* is formed of the bits and fragments of the staple sorts, put into a flat metalline pan, with a very little water, and heated just enough to make the parts cohere like a pancake when it is dried; but frequently it is overheated, and such pieces, as before observed, are useless in the business of fining. Experience has taught the consumers to reject them.

"Isinglass

(B) If the transparent isinglass be held in certain positions to the light, it frequently exhibits beautiful prismatic colours.

Ichthyo-
colla.

“Isinglass is best made in the summer, as frost gives it a disagreeable colour, deprives it of weight, and impairs its gelatinous principles; its fashionable forms are unnecessary, and frequently injurious to its native qualities. It is common to find oily putrid matter, and *exuvie* of insects, between the implicated membranes, which, through the inattention of the cellarman, often contaminate wines and malt-liquors in the act of clarification. These peculiar shapes might probably be introduced originally with a view to conceal and disguise the real substance of isinglass, and preserve the monopoly; but, as the mask is now taken off, it cannot be doubted to answer every purpose more effectually in its native state, without any subsequent manufacture whatever, especially to the principal consumers, who hence will be enabled to procure sufficient supply from the British colonies. Until this laudable end can be fully accomplished, and as a species of isinglass, more easily produceable from the marine fisheries, may probably be more immediately encouraged, it may be manufactured as follows:

“The sounds of cod and ling bear great analogy with those of the *accipenser* genus of Linnæus and Arædi; and are in general so well known as to require no particular description. The Newfoundland and Iceland fishermen split open the fish as soon as taken, and throw the back-bones with the sounds annexed, in a heap; but previous to incipient putrefaction, the sounds are cut out, washed from their slimes, and salted for use. In cutting out the sounds, the intercostal parts are left behind, which are much the best; the Iceland fishermen are so sensible of this, that they beat the bone upon a block with a thick stick, till the pockets, as they term them, come out easily, and thus preserve the sound entire. If the sounds have been cured with salt, that must be dissolved by steeping them in water before they are prepared for isinglass; the fresh sound must then be laid upon a block of wood, whose surface is a little elliptical, to the end of which a small hair-brush is nailed, and with a saw knife the membranes on each side of the sound must be scraped off. The knife is rubbed upon the brush occasionally, to clear its teeth; the pockets are cut open with scissars, and perfectly cleansed of the mucous matter with a coarse cloth; the sounds are afterwards washed a few minutes in lime-water in order to absorb their oily principle, and lastly in clear water. They are then laid upon nets to dry in the air; but if intended to resemble the foreign isinglass, the sounds of cod will only admit of that called *book*, but those of ling both shapes. The thicker the sounds are, the better the isinglass, colour excepted; but that is immaterial to the brewer, who is its chief consumer.

“This isinglass resolves into fining, like the other sorts, in subacid liquors, as stale beer, cyder, old hock,

&c. and in equal quantities produces similar effects upon turbid liquors, except that it falls speedier and closer to the bottom of the vessel, as may be demonstrated in tall cylindrical glasses; but foreign isinglass retains the consistency of fining preferably in warm weather, owing to the greater tenacity of its native mucilage.

“Vegetable acids are, in every respect, best adapted to fining: the mineral acids are too corrosive, and even infalubrious, in common beverage.

“It is remarkable, that, during the conversion of isinglass into fining, the acidity of the menstruum seems greatly diminished, at least to taste; not on account of any alkaline property in the isinglass, probably, but by its enveloping the acid particles. It is likewise reducible into jelly with alkaline liquors, which indeed are solvents of all animal matters; even cold lime-water dissolves it into a pulpy *magma*. Notwithstanding this is inadmissible as fining, on account of the menstruum, it produces admirable effects in other respects: for, on commixture with compositions of plaster, lime, &c. for ornamenting walls exposed to vicissitudes of weather, it adds firmness and permanency to the cement; and if common brick-mortar be worked up with this jelly, it soon becomes almost as hard as the brick itself; but, for this purpose, it is more commodiously prepared, by dissolving it in cold water, acidulated with vitriolic acid; in which case, the acid quits the jelly, and forms with the lime a *selenitic* mass, while, at the same time, the jelly being deprived in some measure of its moisture, through the formation of an indissoluble concrete amongst its parts, soon dries, and hardens into a firm body; whence its superior strength and durability are easily comprehended.

“It has long been a prevalent opinion, that sturgeon, on account of its cartilaginous nature, would yield great quantities of isinglass; but, on examination, no part of this fish, except the inner coat of the sound, promised the least success. This being full of *rugæ*, adheres so firmly to the external membrane, which is useless, that the labour of separating them supercedes the advantage. The intestines, however, which in the larger fish extend several yards in length, being cleansed from their mucus, and dried, were found surprisingly strong and elastic, resembling cords made with the intestines of other animals, commonly called *cat-gut*, and, from some trials, promised superior advantages when applied to mechanic operations.”

Isinglass is sometimes used in medicine; and may be given in a thin acrimonious state of the juices, after the same manner as the vegetable gums and mucilages, regard being had to their different disposition to putrefaction.

Ichthyo-
colla.

ICHTHYOLOGY.

CHAP. I. HISTORY OF ICHTHYOLOGY.

Definition. **I**CHTHYOLOGY (from the Greek *ἰχθυος*, “a fish,” and *λογία*, “discourse”), is that part of zoology which treats of fishes.

Fishes are such animals as have a heart with one auricle and one ventricle, with cold red blood, which inhabit water, and breathe by means of gills. Most of the species are likewise distinguished by fins and scales.

Difficulty of studying fishes. The very element in which fishes live prevents us from following their motions with exactness, from studying their instincts, and from noting with fidelity their specific differences. Their colours often vary, according to the accidental circumstances of age, sex, climate, season, breeding, &c. and often vanish in the open air, or with the principle of life. On the same shores unknown kinds seldom occur; and, when they do, they may pass unnoticed by the illiterate fisherman. Hence, the natural history of the finny tribe has, in all ages, been involved in greater obscurity than that of land animals, which are more readily subjected to the investigation of the learned and the curious. Hence, *Aristotle*, *Pliny*, and *Ælian*, in treating of fishes, have mingled much fable with some truths, and have even confounded classes which nature has distinctly separated. Such, too, is the ambiguity which now attaches to their vague and unscientific nomenclature, and such, we may add, is the indispensable limitation of our plan, that we shall forbear enlarging on the ichthyological portions of their writings. The classical and inquisitive reader may, however, derive entertainment and some instruction from a careful perusal of their text, and of some of the most ingenious and judicious annotations of more recent scholars and naturalists. To the names just mentioned, we may add that of *Athenæus*, who, in the seventh book of his *Deipnosophistæ*, discourses of fishes. *Ovid* celebrates them in his *Halieuticon*; and his example has been followed, not without success, by *Oppian*, a Greek poet, who flourished in the second century, under the reign of Caracalla. *Ausonius*, a native of Bourdeaux, who died towards the conclusion of the fourth century, in his admired poem on the Mollusks, has not forgotten to sing of its inhabitants.

Modern. In the more downward periods of the dark and middle ages, no writer of eminence appears in this department of natural history. Indeed, the first who laid the foundation of ichthyological arrangement was *Pierre Belon*, a French physician, born in 1518, and advantageously known by his travels in Judæa, Greece, and Arabia, as well as by his writings in natural history. Some of his divisions of fishes, as the eleventh, which comprises the flat species that are not cartilaginous; the twelfth, those that are both flat and cartilaginous; the thirteenth, which includes the *squali*, &c. are deduced from natural resemblances; but others are more fanciful; and the wooden cuts are deficient in accuracy and neatness. Belon was an industrious, and rather an

acute observer, who wrote with pleasing naïveté, and who should rank high in the estimation of the learned world, when we reflect on the few resources of which he could avail himself. His history of fishes appeared in 1551. That of his countryman, *Rondelet*, was published three years afterwards, and exhibited more accurate descriptions and figures, with many excellent remarks, the result of his own observation. In point of arrangement, however, *Rondelet*'s work is extremely imperfect, and even puerile. He tells us, for example, &c. that, after very mature deliberation, he resolved to begin with the *gilt-head*, because it was *best known to the ancients and moderns, and highly prized for its delicacy*. He had, however, the merit of exciting a general taste for the study of ichthyology; and *Salviani*, *Bossveti*, *Conrad Gesner*, *Pifon*, &c. who followed him in rapid succession, contributed their share to the stock of scientific facts, though they made few advances to the construction of a natural order.

In 1605, *Aldrovandus*, who published a large compilation on natural history, distributed the fishes according to the nature of their residence; thus, his first book treats of those that frequent rocks; the second is devoted to the littoral; the third to the pelagian, &c. Several authors, whom we cannot stay to name, displayed their talents, with more or less felicity, on the same subject. But their labours were eclipsed by those of *Willoughby*, whose work, entitled *De Historia Piscium*, was printed at Oxford in 1686, and unfolded many new and accurate notions relative to the anatomy and physiology of fishes. His arrangement may be considered as an improved modification of that of Belon. The celebrated *Ray* published, in 1707, his *Synopsis Methodica Piscium*, which may be regarded as an abridged and corrected view of Willoughby's larger work, and as indicating, if not fixing, a series of genera. This valuable descriptive catalogue continued to be appealed to as a standard, till the combined genius of *Artedi* and *Linnæus* effected an important reform in the science of ichthyology.

Artedi, the countryman and friend of the great Swedish naturalist, had adopted his principles, and was engaged in applying them to the systematic illustration of fishes, when death prematurely arrested the prosecution of his design. His illustrious friend put the finishing hand to his papers, and published them in the form of two octavo volumes, under the title of *Bibliotheca Ichthyologica*, and *Philosophia Ichthyologica*, which *Walbaum* re-edited, in four volumes, in 1792. Thus, then, to *Artedi* we may ascribe the merit of having first traced the outlines of that classification of fishes which has now become so popular in Europe; for he first instituted orders and genera, and defined the characters on which these divisions are founded. Independently of the cetaceous tribes, which are now generally classed with the *mammalia*, and of which we have treated in the

History. the article CETOLOGY, his method consisted of four great divisions or orders, namely, the *Malacopterygian*, *Acanthopterygian*, *Branchiostegous*, and *Chondropterygian*. The first denoted those species which have soft fins, or fins with bony rays but without spines, and included twenty-one genera; the second, those with spiny fins, containing sixteen genera; the third, corresponding to the *amphibia nantes* of Linnæus, which want the operculum, or branchiostegous membrane; and the fourth, the Linnæan *amphibia nantes*, which have not true bones, but only cartilages, and the rays of whose fins hardly differ from a membrane. In his first edition of the System of Nature, Linnæus wholly adopted the Artedean method. With regard to the changes which he afterwards introduced, it would be unnecessary to state them in this rapid historical sketch, especially as we purpose to follow his divisions in our systematic exposition.

at first followed by Linnæus. Those ichthyologists who have proposed methods in opposition to that of Linnæus, have usually fallen short of the latter in point of simplicity. Thus Klein, who vainly attempted to rival the professor of Upsala, distributed fishes into three sections, according as they had lungs, and visible or invisible gills; but his subdivisions were so numerous and complex, that his scheme has never been adopted. That of Gronovius was, at least for a few years, much more favourably received. It is principally founded on the presence or absence, and the number or the nature, of the fins. The first class includes all the cetaceous animals, and the second all the fishes. The *chondropterygian*, and the *osseous* or bony, form two great divisions; and the osseous are subdivided into *branchiostegous* and *branchial*. These last are grouped according to the Linnæan rules; but, in the formation of the genera, the number of dorsal fins is admitted as a character, which Linnæus has, perhaps injudiciously, overlooked, and which gives rise to several genera which are not to be found in the System of Nature.—Brunnich laboured, with much pains and considerable ingenuity, to combine the Linnæan and Artedean divisions; but his system remained without encouragement or support.—Scopoli boldly struck out a new path, and assumed the position of the anus as the basis of his three primary divisions. His secondary characters sometimes coincide with those of Gronovius, and sometimes with those of Linnæus; while his third series of distinctions is sometimes drawn from the form of the body, and sometimes from the teeth. Gouan, the celebrated professor of botany at Montpellier, preserved the Linnæan genera, but formed his greater divisions from the union of those of Linnæus and Artedi. His two principal sections are, of fishes with complete, and of those with incomplete, gills; and the first is divided into two others, viz. *acanthopterygian*, and *malacopterygian*, in each of which are ranged the *apodal*, *jugular*, *thoracic*, and *abdominal* species. The same process is followed in the second section, which includes the *branchiostegous* and the *chondropterygian*.

Method of Klein and others. All the authors who have just passed under our review, with the exception of Belon, Rondelet, and Gronovius, published their works without any regular series of plates illustrative of their descriptions. Among those who embellished their volumes with valuable figures, we have to mention *Seba*, in his large collection of

History. subjects belonging to natural history,—*Catefby*, in his Natural History of Carolina,—*Broussonet*, in his *Ichthyologia*,—and *Bloch*, in his Natural History of Fishes, first published at Berlin in German, and in French in 1785, and recently republished in a small form, by Deterville, at Paris, forming part of the extensive work entitled *Histoire Naturelle de Buffon*, &c. Bloch's original work includes about 600 species of fishes, which are generally described with great accuracy, figured, as nearly as circumstances will admit, of the natural size, and beautifully coloured. The author enters with some minuteness into the history of those which afford food for man, or which suggest facts worthy of remark. He has followed the Linnæan method, and made considerable additions to the number of genera.

Of La Cépède. *La Cépède*, the friend and continuator of Buffon, has likewise executed an elaborate and extensive undertaking on the natural history of fishes. He divides this class of animals into two secondary classes, viz. the *cartilaginous* and the *osseous*. Each of these subordinate classes consists of four divisions, taken from the combinations of the presence or absence of the operculum, and of the branchial membrane; thus, the first division of the cartilaginous includes those fishes which have neither operculum nor branchial membrane; the second, those which have no operculum, but a membrane; the third, those which have an operculum, but no membrane; and the fourth, those which have both. The same characters, stated in the inverse order, determine the divisions of the osseous species. Each of these divisions is again distributed into the Linnæan orders, and these, in turn, into the Linnæan genera. The contents of the latter, however, do not always correspond with the enumerations in the System of Nature; for the French zoologist has withdrawn many species from their former categories, and ranged them under new genera. His innovations in this respect are, perhaps, not always improvements; and some of his generic appellations, as *gobie*, *gobiosore*, *gobioides*, *gobiomore*, and *gobiomoroides*, *pomacanthæ*, *pomacentæ*, *pomadasyæ*, and *pomatome*, &c. are too nearly allied in sound and orthography, to be readily discriminated by the memory. We have, moreover, to regret that the plates are not coloured, and that they are executed on too small a scale. Yet, after every deduction which even rigid criticism may require from the merits of this publication, enough will remain to attest the industry and the talents of its author, and to justify the high rank which he has obtained among the writers on ichthyology.

Of Pennant. Before closing even these very condensed notices, it would be unpardonable to omit reminding our readers, that the British fishes have found an able and entertaining expositor in Mr Pennant, to whom the natural history of this country is under many obligations. In the third volume of his British Zoology, this author describes the fishes under the three great divisions of *cetaceous*, *cartilaginous*, and *bony*. The latter, which is by far the most numerous, he subdivides into four sections, entitled, agreeably to the Linnæan orders, *apodal*, *thoracic*, *jugular*, and *abdominal*.

Besides the sources of information to which we have referred, the curious inquirer into the history of fishes may occasionally resort to Duhamel's General Treatise

Anatomy
of Fishes.

on the Fisheries, Fabricius's *Fauna Grœnlandica*, Flamenon on the different kinds of fresh-water fishes, Forkal's *Fauna Arabica*, Johnston's *Historia Naturalis de Piscibus et Cetis*, Kolreuter's papers in different volumes of the Peterburg Transactions, the fourth vo-

lume of Marigli's *Danubius Pannonico-Mysius*, &c. Monro's Anatomy of Fishes, Pallas's *Spicilegia Zoologica*, &c. Vicq d'Azyr's Memoirs on the Anatomy of Fishes, and the two volumes of the *Encyclopédie Méthodique* which are devoted to the article *Poissons*.

Anatomy
of Fishes.

CHAP. II. ANATOMY OF FISHES.

Form of
the body.

THE *shape* of the body of fishes is subject to considerable varieties. It is said to be *compressed*, when the diameter, from side to side, is less than from back to belly; and *depressed*, on the contrary, when the diameter, from side to side, is greater than from back to belly. It is *cylindrical*, when it is circular in the greater part of its length; *ensiform*, or sword-shaped, when the back and belly terminate in a sharp edge, or when the body gradually tapers from the head to the tail; *cuttreated*, or knife-shaped, when the back is somewhat flat, and the angle below acute; *carinated*, or keel-shaped, when the back is rounded, and the under part of the belly acute, through its length; *oblong*, when the longitudinal diameter is much longer than the transverse; *oval*, when the longitudinal diameter not only exceeds the transverse, but the base is circular, and the apex more acute; *orbicular*, when the longitudinal and transverse diameters are nearly equal; *lamelated*, or spear-shaped, when oblong, and attenuated at both extremities; *cuneiform*, or wedge-shaped, when the body gradually flattens towards the tail; *conical*, when it is cylindrical, and grows gradually more slender towards the tail; *ventricose*, when the belly is very prominent; *gibbous*, when the back presents one or more protuberances; *annulated*, when the body is surrounded by rings, or elevated lines; *articulated*, when it is covered with connected and bony plates; *trigon*, *tetragon*, *pentagon*, and *hexagon*, when the sides are plain, with three, four, or six longitudinal angles; if the number of these angles exceed six, it is termed a *polygon*.

The *surface* of the body of fishes is termed *naked*, when it is destitute of scales; *scaly*, when provided with them; *smooth*, when the scales are without angles, furrows, roughness, or inequalities; *lubricous*, or slippery, when invested with a mucous or slimy humour; *tuberculated*, or rough, when covered with prominent warts or tubercles; *papillous*, when covered with fleshy points; *spinous*, when the asperities are elongated, and pointed at their extremities; *loricated*, or mailed, when the body is inclosed in a hard, callous, or bony integument, or in scales so closely united as to seem but one; *fasciated*, or banded, when marked with transverse zones from the back to the belly; *striped*, when marked with very narrow, scattered, and coloured streaks; *vitiated*, when marked with longitudinal zones along the side, from the head to the tail; *reticulated*, or chequered, when marked with lines forming the appearance of net-work; *pointed*, or dotted, when marked with points, either longitudinally disposed, or without order; and *variegated*, when of different colours.

The *parts* of the body are either *external*, or *internal*: the former include the *head*, *trunk*, and *fins*; the latter, the *skeleton*, *muscles*, and *viscera*.

1. The *HEAD* is always placed at the anterior part of the body, and reaches from the extremity of the nose to the gills.

Several of the technical terms already defined, are applied to the head as well as to the whole body; but others, which are more appropriate, require to be explained. *Obtuse* or *truncated*, denotes that the head is blunt, or terminated by a transverse line; *acute*, that it terminates in an acute angle; *slanting*, that it presents an inclined plane, from the top of the anterior part to the extremity of the nose; *aculeated*, or prickly, that it is armed with sharp points or spines; *unarmed*, that it is without spines or tubercles; *beardless*, that it is without cirrhi, &c.

The head contains the mouth, nose, jaws, lips, teeth, tongue, palate, nostrils, eyes, branchial opercules, the branchioflegous membrane, the aperture of the gills, and the nape.

The *mouth* is that cavity, which is terminated in front by its own orifice; on the sides, by the branchial opercula; and behind, by the throat. It is *superior*, when placed at the upper part of the head; *inferior*, when at the lower part; *vertical*, when it descends perpendicularly from the upper part; *transverse*, or *horizontal*, when it is parallel to the surface of the water when the fish swims; *oblique*, when it is neither vertical nor horizontal; *tubular*, or *fishular*, when the orifice is narrow, round, and deep; *simous*, or flat-nosed, when the orifice is not prominent or deep.

The *nose*, or *snout*, is the fore part of the head, extending from the eyes to the extremity of the jaws. It is *cuspidated*, when its apex terminates in a sharp point or bristle; *spatula-shaped*, when its extremity is flattened and extended; *bifid*, *forked*, or *lobed*, when its extremity is divided into two lobes; *triquetrous* and *tetraquetrous*, when it has three or four flat sides; and *re-flex*, when it is incurved towards the belly.

The *jaws* are always two in number, and differ in different species chiefly in respect of figure and proportion. They are *subulate*, or awl-shaped, when they are rounded at the base, and are gradually attenuated towards the apex; *carinated*, or keel-shaped, when the lower jaw is longitudinally ridged, either without or within; *equal*, when both are of the same length; *unequal*, when one projects beyond the other; *naked*, when not covered with lips; *labiate*, when covered with one or two lips; *edentulated*, when destitute of teeth; *dentated*, or toothed, when furnished with teeth of unequal size; *dentato-crenated*, when the bones are formed into the appearance of teeth; *cirrated*, or *cirrose*, when furnished with cirrhi, or bristly membranaceous appendages, which hang from one or both jaws; *vaginated*, or sheathed, when the margin of one covers that of the other; *arched*, or covered, when furnished with a membranaceous veil, attached before, and loose behind,

Artemis
of Fishes.

behind, within which, and the upper or under part of the mouth, the fish lays its tongue, or discharges water from its mouth; and *moveable*, when they can be thrust out or drawn in.

The *lips* are obvious only in a few fishes, and are either of a fleshy or bony consistence. They are also distinguished into *plicated*, or consisting of folds, and *retractile*, or capable of being drawn out or in, at the pleasure of the animal.

The *teeth* are *acute*, when their extremity terminates in a point; *obtuse*, when it is rounded; *granular*, when the teeth are of the size and shape of small grains; *plane*, when flat on the sides; *semi-sagittate*, when hooked on one side only; *ferrated*, when toothed like a saw on the margin; *emarginate*, when the extremity is somewhat cleft; *recurved*, when inclined towards the gullet; *parallel*, when of the same direction, length, and figure; *diverging*, when the apices stand wide, or distant from each other; *similar*, when they are all of the same size and figure; *dissimilar*, when some are acute, and others obtuse; *ordinate*, when disposed in one or more rows; *confused*, when crowded, and not disposed in any regular order.

The *tongue* is termed *acute* or *obtuse*, according as its extremity terminates in a point, or is rounded; it is *emarginate*, or *bifid*, when the extremity is divided into two lobes; *carinated*, when angulated on the upper or lower surface; *dentated*, when its surface is furnished with teeth; and *papillous*, when covered with fleshy points.

The *palate* is that part of the mouth which is included between the base of the jaws and the origin of the œsophagus. It is either *smooth*, when its surface is destitute of tubercles, teeth, and asperities; or *denticulated*, when furnished with teeth.

The *nostrils* are orifices, almost always situated in the rostrum, before the eyes. They are *anterior*, when they occupy the fore part of the rostrum, and are somewhat distant from the eyes; *posterior*, when situated at the base of the rostrum, and very near the eyes; *superior*, when on the crown of the head, between the eyes, and close to them; *cylindrical*, when they form a tube; *single*, or *solitary*, when there is only one on each side of the head; and *double*, when there are two on each side.

Eyes.

The *eyes* are always two, and are composed of two principal parts, which as they are visible from without belong to the description of the external structure. These parts are the *pupil* and the *iris*. The first occupies the centre of the globe; and is usually spherical, but sometimes oval; and the second is the coloured circle which surrounds the pupil, and is often furnished with a distinct ring. It is, for the most part black or gold-coloured, but sometimes it assumes a silvery hue. —The eyes are said to be *covered*, when they are enveloped in the skin, or in a nictitating membrane; *semi-covered*, when this membrane is arched, or lunulated, or perforated like a ring; *naked*, when destitute of a nictitating membrane; *vertical*, when situated on the crown of the head; *lateral*, when placed on the sides of the head; *binate*, when they are both on the same side of the head; *plane*, or *depressed*, when the convexity of the ball does not exceed the surface of the head; *convex*, when the convexity projects beyond

this surface; *salient*, when the eyes are very prominent.

Anatomy
of Fishes.
Branchial
opercles.

The *branchial opercles*, are scaly or bony processes, situated on both sides of the head, behind the eyes, closing the aperture of the gills, and sustaining the branchial membrane. They are termed *simple*, when composed of a single piece; *diphyllous*, *triphyllous*, or *tetraphyllous*, when consisting of two, three, or four pieces; *flexile*, or *soft*, when they can be easily bent; *sub-arcuated*, when the posterior margin is rounded; *sinulous*, when the branchial opening seems to be excavated out of the substance of the opercula; *acuminated*, when the hinder plate runs out into a sharp process; *ciliated*, when the posterior margin is fringed, or set with membranous setaceous appendages; *frenated*, or *bridled*, when connected with the body by means of a membrane; *scabrous*, when their surface is covered with asperities; *striated*, when marked with hollow and nearly parallel lines; *radiated*, when the lines run like rays, from the centre to the edge; *graved*, when the lines appear in no regular order; *aculeated*, when the posterior margin is terminated by one or more spines; *ferrated*, when it is cut like the teeth of a saw; *scaly*, when the surface of the opercles is covered with scabs.

The *branchial*, or *branchioseous membrane*, is a true And mem- fin, formed of cartilaginous crooked bones, joined by a brace.

thin membrane, lurking under the opercula, to which it adheres, and is capable of being folded or expanded, as necessity requires. This membrane is said to be *patient*, when it projects beyond the margin of the opercula; *retracted* or *latent*, when it is concealed under them; *covered*, when concealed under them, yet so as to be visible without hurting them.

The *aperture of the gills*, is a cleft commonly lateral, which opens between the opercula and the trunk, by means of the gills. It is *arcuated*, or arched, when it represents a crescent; *operculated*, when quite covered by the opercula; *pipe-shaped*, when in the form of a tube. Its place, in some of the cartilaginous species, is supplied by *vents*, or *spiracles*, which are either *round*, *arched*, *lateral*, or *inferior*, i. e. placed underneath the body.

The *nape* is the hind and terminating part of the head, which is attached to the first vertebra of the trunk, in the region of the gills. It is *carinated*, when its surface is sharply angulated; *plane*, when flat, and on a level with the body; and *fusicated*, when ridged or furrowed.

2. The **TRUNK** is that part of the body, which The trunk. extends from the nape and branchial aperture, to the extremity of the tail. It comprehends the gills, throat, thorax, back, sides, abdomen, lateral line, anus, tail, and scales.

The *gills*, or *branchiæ*, consist, for the most part, of four crooked, parallel, unequal bones, furnished, on the outer or convex part, with small soft appendages, like the beards of a feather, and generally of a red colour. They are *aculeated*, when the concave or interior part has spines instead of tubercles; *anomalous*, when some are ciliated, others tuberculated, or of a different structure: *denuded*, when wanting opercles, the branchioseous membrane, or both; *pectinated*, when the convex or exterior part, towards the branchial aperture,

is

Anatomy
of Fishes.

is furnished with red setaceous rays, or lamellæ; *with-drawn*, when not conspicuous, lying nearer the throat than the aperture; *simple*, when furnished either with filaments or tubercles; *approaching*, when they correspond to the same aperture.

The *throat* is that part which corresponds to the branchial apertures, and is placed between them. It is *swelling*, when it exceeds the level of the body and the head; *carinated*, when angulated underneath; *plane*, when on a level with the thorax and head.

The *thorax* is that part which begins at the extremity of the throat, and is terminated by a line drawn to the insertion of the pectoral fins.

The *back* is the upper part of the trunk, extending from the nape to the origin of the tail. It is *apterygious*, without fins; *monopterygious*, *dipterygious*, &c. with one, or two fins; *convex*, higher in the middle than toward the sides; *ferrated*, having a deep longitudinal furrow for the same purpose.

The *sides* are that part of the trunk, which reaches from the gills to the anus, between the back and the abdomen. They are sometimes marked with zones, lines, spots, or points.

The *abdomen* is the under part of the trunk, between the posterior extremity of the thorax and the origin of the tail. It is *carinated*, or *acute* through its length; *ferrated*, when the scales forming the carina are disposed like the teeth of a saw; *plane*, when without prominence or depression.

The *lateral line* usually commences at the extremity of the branchial opercles, runs along the sides, and terminates at the caudal fin. It is formed by lines, dots, or small tubercles. It is *straight*, when it presents no inflexion through its length; *curved*, when it inclines to the back or belly; *broken*, when divided into two or more parts, which follow different directions; *obliterated*, when scarcely perceptible; *double*, when there are two on each side; *smooth*, when without prickles or tubercles; *aculeated*, when furnished with spines; *descending*, when it runs obliquely from the head to the tail; *inferior*, when situated on the lower part of the side; *loricated*, or *mailed*, when rough with small bones, or hard scaly tubercles; *mean*, when situated in the middle of the side; *obsolete*, when nearly effaced; *porous*, when punctured with small holes; *sinuous*, when bent in a waving line; *solitary*, when there is one line on each side; *superior*, when on the upper part of the side, near the back; *banded*, when covered with a longitudinal zone, coloured or silvery.

The *anus* is the external orifice of the rectum. It is *jugular*, when situated under the branchial opercles; *pectoral*, when under the gills; *mean*, when equally removed from the head and the extremity of the tail; *remote*, when near the tail.

The *tail* is the solid part of the trunk, which it terminates, being situated behind the anus. It is *round*, as in the lamprey and eels; *carinated*, when its surface presents some sharp angle; *muricated*, when beset with spines or tubercles; *apterygious*, when destitute of fins; *diparygious*, when the fin is divided at the base.

The *scales* are pellucid, cartilaginous, or horny teguments, which usually cover the trunk. They are *oval*, when one extremity is rounded, and larger than the other; *orbiculate*, when nearly round; *smooth*, when

destitute of sensible angles or asperities; *ciliated*, when the margin is set with setaceous processes; *ferrated*, when the margin is toothed like a saw; *imbricated*, when the scales partly cover one another, like tiles on a roof; *rare*, when sensibly separated from one another; *deciduous*, when they easily fall off; *tenacious*, when they are detached with difficulty; *remote*, when separated from one another; *verticillate*, when surrounding the body in rings.

3. The *FINS* consist of several rays connected by a tender film, or membrane; and they are raised, expanded, or moved in various directions, by means of appropriate muscles. The rays of the fins are either jointed and flexible small bones, whose extremity is often divided into two parts; or hard and prickly, without division at the extremity. In some cases, those on the back of the fish are furnished with membranaceous appendages, simple, or palmated, and adhering to the apex or sides.—The fins, according to their position, are denominated *dorsal*, *pectoral*, *ventral*, *anal*, or *caudal*.

The *dorsal* fins are situated on the upper part of the body, between the head and the tail. Their number varies from one to three, and so gives rise to the epithets *monopterygious*, *dipterygious*, and *tripterygious*. If the back has no fin, it is said to be *apterygious*. The form, size, and situation of the dorsal fins have likewise suggested various technical appellations; but few of these require to be particularly defined. We shall notice, therefore, only the *fleshy*, which are covered with a thick skin, or muscular substance; and the *ramentaceous*, which are furnished with membranaceous or filamentous appendages.

The *pectoral* fins are situated on each side, about the aperture of the gills. In some species, they are wanting; in others, *solitary*, or one on each side; in a few they are *double*, i. e. two on each side; in some, they are *falcated*, or arched above, and concave below.

The *ventral* or *inferior* fins are always placed on the under part of the fish; but at a greater distance from the mouth. They are *abdominal*, when placed in the belly, behind the pectoral fins, and not fixed in the sternum, but in the ossa pelvis; *difform*, when they have a spine or cirrus, besides the ossicles; *jugular*, when placed under the throat before the pectoral fins, and fixed to the clavicles; *multiradiated*, when they have several rays, though seldom exceeding seven; *thoracic*, when placed under the pectoral fins, often a little behind them, but always fixed to the sternum.

The *anal* fin is placed between the anus and the caudal fin. It is *bifurcated*, or *two-forked*, when the ossicles in the middle are shortest; *coalescing*, when united with the caudal fin; *longitudinal*, when it extends from the anus to the tail; *posterior*, when placed at the end of the tail, near the caudal fin.

The *caudal* fin is situated vertically, at the extremity of the body. It is *equal*, or *entire*, when its rays are of equal length; *lanceolated*, when the rays in the middle are longer than the others; *emarginate*, when they are shorter than the others; *bifid*, when they are very short; *trifid*, when the fin is divided into three lobes; *coalescing*, when united with the dorsal and anal fins; *cuspidated*, when attenuated at the apex, or terminating in a setaceous point; *setiferous*, when a filiform appendage proceeds from the division.

Internal

Internal Parts.

1. The **SKELETON** of a fish is the assemblage of bones which constitutes the frame-work of its body. The number of these bones is not uniform in each individual, but varies according to age and species. They may be conveniently divided into those of the head, thorax, abdomen, and fins.

The *head* contains a considerable number of bones; that of the perch, for example, has eighty. As the limited nature of our plan precludes minute specification, we shall only indicate a few of the most important. The *skull* covers the whole head, its sides frequently forming the sockets of the eyes, the temples, and the cheeks. The upper and lower *jaw-bones* are placed on the fore part of the head. The upper is more or less of an arched form. In some fishes it is wanting, and its place supplied by a portion of the skull. The lower jaw is usually arched or triangular, and its length regulates that of the snout, or rostrum. The *bones of the palate* are, for the most part, four, viz. two on each side of the fauces, oval, and nearly plane, often crowded with teeth, or rough with tubercles, or furrowed transversely, the base of the one connected with the apex of the other. The gills are attached to these ossicles on each side by a cartilage. The *opercular bones* are situated at the hind part of the jaws, on each side of the head, and behind the eyes. In some species, they form a part of the upper jaw. The *hyoid bone* is an ossicle situated between the two sides of the lower jaw, serving as a basis for the tongue, presenting the figure of a V, and occasionally furnished with a hook.

The *thorax* is a cavity principally formed by the vertebrae, the sternum, the clavicles, and the scapulae. The *vertebrae* form the back-bone, which reaches from the skull to the extremity of the tail. They are stronger and thicker towards the head, and grow weaker and more slender towards the tail. Each species has a determinate number of vertebrae, which grow with the body. They are furnished with transverse and spiny processes, the former of which are marked by transverse lines, by the number of which, it is supposed, the age of fishes may be known. The spinal marrow is contained in the canal which passes through the vertebrae. The *sternum* in fishes is not cartilaginous, as in other animals, but always bony. Its form varies considerably, being sometimes triangular, sometimes rounded before, and pointed behind, but most frequently of a rhomboidal figure. It occupies the fore part of the thorax, and closes that cavity. The *clavicles* are two bones situated transversely behind the opening of the gills; and are sometimes formed by two ossicles united. They are attached to the first vertebra. The *scapulae* are two flat, rhomboidal, or arched bones, situated on the lateral side of the body, under the posterior margin of the clavicles, and serving as a base to the pectoral fins. When the scapulae are wanting, the pectoral fins are attached to the sternum, or to the margin of the clavicles.

The *abdomen* forms a cavity always larger than that of the thorax, extending from the extremity of the latter to the anus. It is encompassed by the ribs and the *ossa pelvis*. The *ribs* are bony arches, situated obliquely on the lateral parts of the abdomen,

having their upper extremity articulated with the extremity of the transverse processes of the vertebrae. Their number is very variable. In those species which are without ribs, the absence of the latter is compensated by the length and direction of the transverse processes of the vertebrae. The *ossa pelvis* are two bones which defend the viscera contained in the abdomen. The ventral fins are usually attached to their posterior margin. When these fins are wanting, or when they are attached under the throat, or on the thorax, the *ossa pelvis* are also wanting. The *tail* is composed of certain bones, which terminate the vertebral column. The processes of each vertebra of the tail are incident to great variety in respect of number and dimensions.

The *fins* are formed of a certain number of ossicles, connected to one another by firm membranes. The dorsal and anal fins are supported by the *inter-spinous bones* (*ossa interspinosa*), which lie between the pointed processes of the vertebrae, and are connected with them by a ligament. The rays of the anal fin have nearly the same conformation as those of the dorsal.

2. The **MUSCLES** are an assemblage of small bundles of fleshy fibres, partly red, and partly whitish, enveloped in a common membrane. The first of these is called the *fleshy portion of the muscle*, the second, the *tendon*. Each muscle thus composed, is susceptible of contraction and dilatation. The former is accompanied by a visible swelling, hardening, wrinkling, and shortening of the muscle, and the latter by its elongation, expansion, and recovery of its former softness and flexibility. Its force, in general, depends on the quantity of fibrous matter which enters into its composition, and its moving power on the length and size of the fibres. The muscles vary much in respect of number, size, and situation. There are two which proceed from the head to the tail, along the sides of the body, and thence denominated *lateral muscles*. Each of these seems to be composed of several transverse muscles, which are similar and parallel. There are four situated at the caudal fin, namely, three superior, and one inferior. Of the two former, one is straight, and two are oblique. The fourth occupies the half of the lower extremity of the tail. There are likewise four at each pectoral fin, namely, two *erectors* and two *depressors*; the two former situated on the external surface of the clavicles and scapulae, and the two latter under these parts. Each ventral fin has three muscles, one erector and two depressors; the first placed over the whole external surface of the *os pelvis*, and the two latter on the internal surface of the same part. The *carinal muscles* of the back and tail are slender, and closely united, occupying the space that is left between the lateral muscles. Their number is always proportioned to that of the dorsal fins. Fishes, for example, which have no dorsal fin, have but one pair of carinal muscles, those which have one dorsal fin, have two pairs, and those which have two dorsal fins, have three pairs, viz. one pair between the first and second fin, another between the two fins, and a third between the second dorsal and the caudal fin. The *proper inter-spinous muscles* are those whose office it is to raise or depress the dorsal and anal fins. Each inter-spinous ray is furnished with four, two erectors, and two depressors. The dilating muscle of the branchiostegous membrane is small, and attached by its anterior extremity, partly under the angle of the lower

Anatomy
of Fishes.

lower jaw, and partly to the sides of the *os pelvis*. It is fixed to the branchial membrane by as many tendons as there are tendons in the membrane.

Brain and
other or-
gans.

3. **ORGANS and VISCERA.**—The *brain* of fishes is a very small organ, relative to the size of the head. It is divided into three equal lobes, of which the two anterior are contiguous; the third being placed behind, and forming the *cerebellum*. These three lobes are surrounded by a frothy matter, resembling saliva. In this region the optic and olfactory nerves are easily discovered.

The *œsophagus*, or *gullet*, begins at the bottom of the throat, and descends, in a straight line, to the upper orifice of the stomach. It is membranous, smooth, and lined with a mucous humour.

The *stomach* is a membranous sack, sometimes cylindrical or spherical, and sometimes divided into two lobes.

The *swimming*, or *air-bladder*, or *sound*, is an oblong, white, membranous bag, sometimes cylindrical, sometimes elliptical, and sometimes divided into two or three lobes, of different lengths. It is usually situated between the vertebræ and the stomach, and included within the *peritonæum*. In some fishes it communicates with the stomach, and in others, with the *œsophagus*. The flat fishes are unprovided with this organ.

The *intestines*, which in man are placed transversely, have a longitudinal position in fishes, and are all connected with the substance of the liver. They are in general very short, making only three turns, the last of which terminates in a common outlet or vent. The appendices, or secondary intestines, are very numerous, composing a groupe of worm-like processes, all ultimately terminating in two large canals, opening into the first intestine, into which they discharge their peculiar fluid.

The *liver* is commonly of a yellowish colour. It is situated on the right or left side, or in the anterior region of the abdomen, of whose cavity it fills about two thirds. It is sometimes simple, and sometimes divided into two, three, or more lobes. It usually contains a large portion of oil or fat.

The *gall-bladder* is oval or oblong, and lies under the right side of the liver. It communicates with the stomach or the intestines, by means of the cystic duct and the choledochic canal.

The *spleen* varies in form and position. Sometimes it is all of a piece; sometimes divided into many lobes, which adhere only by very slender filaments. In some individuals it is black, in others it has the red hue of clotted blood. It is placed near the backbone, and at a place where it is subject to an alternate constriction and dilatation, from the pressure of the air-bag, which is situated in its neighbourhood.

Almost all fishes are provided with the *urinary bladder*. Its form is nearly oval. It terminates under the tail; and has no communication with the *rectum*.

The *kidneys* are two flat bodies, of a pyramidal form, as long as the abdomen, and of a reddish colour. They are attached to the vertebræ, separated from the cavity of the abdomen by the *peritonæum*, and frequently prolonged from the diaphragm to the region of the urinary bladder.

The *diaphragm* is a white and shining membrane

which separates the thorax from the abdomen. This partition is partly fleshy and partly tendinous.

The *peritonæum*, or membrane investing the contents of the abdomen, is thin and of a blackish colour.

The *ova*, in the females, are disposed into two large oblong bodies, one on each side of the abdomen; and the *milt* or *soft-roe*, in the male, appears in a similar form in the same part.

The *pericardium* is a small bag which contains the heart.

The *heart* is a viscus situated on the sternum, under the posterior gills. It varies considerably in form, being sometimes flat, frequently triangular or pyramidal, &c. Its position is not transverse, as Artdi has alleged, but longitudinal, as in quadrupeds. It consists of one ventricle and one auricle. The sides of the former are rugose, and exhibit many small cavities. The latter is a very slender muscular bag, with a larger cavity than that of the ventricle, and forming the communication between the heart and

The *venous sinus*. The capacity of this last is still greater than that of the auricle. Its position is transverse, corresponding to that of the diaphragm. It communicates with the auricle by a large aperture, and receives at the other end three large trunks of veins.

The *aorta* is an artery attached to the apex of the heart, and sending out numberless branches to the gills, on which it is subdivided into ramifications so minute as to escape the eye unless assisted by a glass.

The *blood* of fishes is red, and the red particles are not round as in the mammalia, but oval as in the amphibia.

Dr Monro's elaborate description of the *absorbent system* in fishes, is thus stated by Dr Shaw in the fourth volume of his *General Zoology*.

"On the middle of the belly, immediately below the outer skin, a lymphatic vessel runs upwards from the vent, and receives branches from the sides of the belly and the fin below the vent; near the head this lymphatic passes between the two pectoral fins, and having got above them, receives their lymphatics: it then goes under the juncture of the two bones which form the thorax, where it opens into a net-work of very large lymphatics which lie close to the pericardium, and almost surrounds the heart: this net-work, besides that part of it behind the heart, has a large lymphatic on each side, which receives others from the kidney, runs upon the bone of the thorax backwards, and when it has got as far as the middle of that bone, sends off a large branch from its inside to join the thoracic duct; after detaching this branch, it is joined by the lymphatics of the thoracic fins, and soon after by a lymphatic which runs upon the side of the fish; it is formed of branches, which give it a beautiful penniform appearance. Besides these branches, there is another set lying deeper, which accompanies the ribs; after the large lymphatic has been joined by the above-mentioned vessels, it receives others from the gills, orbit, nose, and mouth: a little below the orbit another net-work appears, consisting in part of the vessels above described, and of the thoracic duct: this net-work is very complete, some of its vessels lying on each side the muscles of the gills, and from its internal part a trunk is sent out, which terminates in the jugular vein.

"The lacteals run on each side of the mesenteric arteries,

Anatomy
of Fishes.

Chap. III.

Physiology
and
Habitudes
of Fishes.

teries, anastomosing frequently across those vessels: the receptacle into which they enter is very large in proportion to them, and consists at its lower part of two branches, one of which lies between the duodenum and the stomach, and runs a little way upon the pancreas, receiving the lymphatics of the liver, pancreas, lower part of the stomach, and the lacteals from the greater part of the small intestines: the other branch of the receptacle receives the lymphatics from the rest of the alimentary canal. The receptacle formed by these two branches lies on the right side of the upper part of the stomach, and is joined by some lymphatics in that part, and also by some from the found and gall-bladder: the thoracic duct takes its rise from the receptacle, and lies on the right side of the œsophagus, receiving lymphatics from that part; and running up about half an inch, divides into two ducts, one of which passes over the œsophagus to the left side, and the other goes straight upon the right side, passing by the upper part of the kidney, from which it receives some small branches, and soon afterwards is joined by a branch from the large lymphatic that lies above the bone of the thorax, as formerly mentioned: near this part it likewise sends off a branch to join the duct of the opposite side; and then, a little higher, is joined by those large lymphatics from the upper part of the gills and from the fauces.

“The thoracic duct, after being joined by these

vessels, communicates with the net-work near the orbit, where its lymph is mixed with that of the lymphatics from the posterior part of the gills, and from the superior fins, belly, &c. and then from this net-work a vessel goes into the jugular vein just below the orbit. This last vessel, which may be called the termination of the whole system, is very small in proportion to the net-work from which it rises; and indeed the lymphatics of the part are so large as to exceed by far the size of the sanguiferous vessels.

“The thoracic duct from the left side, having passed under the œsophagus from the right, runs on the inside of the vena cava of the left side, receives a branch from its fellow of the opposite side, and joins the large lymphatics which lie on the left side of the pericardium, and a part of those which lie behind the heart, and afterwards makes, together with the lymphatics from the gills, upper fins, and side of the fish, a net-work, from which a vessel passes into the jugular vein of this side: in a word, the lymphatics of the left side agree exactly with those of the right. Another part of the system is more deeply seated, lying between the roots of the spinal processes of the back-bone. This part consists of a large trunk that begins from the lower part of the fish, and as it ascends receives branches from the dorsal fins and adjacent parts of the body: it goes up near the head, and sends a branch to each thoracic duct near its origin.”

CHAP. III. PHYSIOLOGY AND HABITUDES OF FISHES.

MOST of the observations which belong to this section may be referred to the general topics of *respiration, external senses, motion, nourishment, reproduction, and duration.*

1. *Respiration.*Respiration
performed
by gills.

This important animal function is performed, in fishes, by means of gills, which supply the place of lungs. Though all fishes live in water, the presence of air is not less necessary to their existence than to our own. If a carp, for example, be put into a large vase of water, from which the air is extracted by the air-pump, a number of bubbles are observable on the surface of the fish's body; soon after, the animal breathes swifter and with greater difficulty; it then rises to the surface to get more air; the bubbles on its surface begin to disappear; next, the belly, which was swollen, will suddenly fall, and the fish sink to the bottom, convulsed and expiring. For the same reason, if the external air be excluded from a small pond by a sufficient and durable covering of ice, the fish within it will be killed: or if a hole be made in the ice, before it be too late, they will all come near it for a fresh supply of air. In ordinary cases, a fish in the water first receives a quantity of that element by the mouth, from which it is driven to the gills; these close, and prevent the water so swallowed from returning by the mouth, at the same time that their bony covering prevents it from passing through them, until the proper quantity of air has been drawn from it. The covers then open, and give it a free passage: by which means the gills also are again opened, and admit a fresh body of water.

Vol. XI. Part I.

Should the free play of the gills be suspended, or their covers kept from moving, by a string tied round them, the fish would soon fall into convulsions, and die in a few minutes. Though the branchial apparatus be compressed in a small compass, its surface, if fully extended, would occupy a very considerable space, since that of the common skate is equal to the surface of the human body. This single fact may convince us of the numberless convolutions and ramifications in which the included water is elaborated and attenuated in the course of giving out its air in the respiratory process. This process, in fishes, as in the human subject, is carried on during sleep, and is repeated about twenty-five times in a minute.

Atmospheric air, though in small quantities, is thus imparted to the blood at the ramifications of the gills, without, however, depriving it of a large share of the hydrogenated and carbonized substances furnished by the aliments; and, consequently, without communicating to it so much of the vermilion tinge as is observable in warm-blooded animals with lungs. Hence the oily quality of the blood of fishes, and the greasy congestions which take place in their livers, and in the abdominal regions of animals whose respiration is slow or scanty. The act of breathing is, in reality, a species of combustion; and the temperature of animals in whose system this combustion is imperfectly performed, is necessarily low. As that of fishes is little elevated above the mean temperature of water, some species, as eels and gudgeons, are occasionally benumbed by the winter's cold, and remain concealed in the mud or sand, without motion, food, or breathing, till the warmth of spring rouses them from their torpor. As

K

the

Physiology
and
Habitudes
of Fishes.

the bottom of the sea, however, probably preserves a pretty equal degree of heat at all times, the myriad tribes which inhabit it are permanently secured against the inclemency of the season. The tardy circulation of the blood in fishes may likewise, in some measure, depend on their mode of respiration. The heart of the carp contracts only thirty-six times in the course of a minute, or about half as often as that of a man. In the carnivorous species of fishes, as the shark, pike, salmon, &c. the heart is comparatively larger, the circulation more rapid, and the breathing more powerful. Active, robust, and courageous, they are also less encumbered with fat, and their liver is less bulky than in the other species. It deserves to be remarked, however, that the blood in fishes, after being thrown by the heart into the ramifications of the gills, is collected again by a vast number of small veins, somewhat in the same manner as in the mammalia; but instead of returning to the heart again, these vessels unite and form a descending aorta, without the intervention of an auricle and ventricle, a circumstance which may also materially contribute to the slowness of the circulation. For some time it was believed, that the cartilaginous fishes were provided with internal lungs, an idea which has been abandoned by later physiologists, who have proved, that the supposed lungs are only a peculiar modification of gills. To the want of lungs we may ascribe the want of voice: for, though some kinds of fishes, as those of the genus *balistes*, when seized, discharge a quantity of air and water with a rustling noise, and the rubbing of the fins on the scales sometimes produces an indistinct rattling sound; yet both are very different from any thing like audible language that can be understood among the individuals of a species.

2. External Senses.

Sense of
seeing.

That fishes possess the faculty of *seeing*, is evident from the accuracy with which they direct their motions to the objects of their pursuit. Their organs of vision, too, are admirably adapted to the circumstances of their condition. As their eyes are not placed in the forepart, but in the sides of the head, they cannot look, at the same time, with both on one object, so conveniently as quadrupeds. Their optic nerves, accordingly, are not confounded with one another, in their middle progress betwixt their origin and the orbit, but the one passes over the other without any communication; so that the nerve which comes from the left side of the brain, goes distinctly to the right eye, and *vice versa*. As fishes are continually exposed to injuries in the uncertain element in which they reside, and as they are in perpetual danger of becoming a prey to the larger ones, it was necessary that their eyes should never be shut; and as the cornea is sufficiently washed by the element in which they live, they are not provided with eye-lids; yet, as in the current itself, the eye must be exposed to several injuries, it is defended by a firm pellucid membrane, being a continuation of the same transparent cuticle which covers the rest of the head, and which, being insensible and destitute of vessels, is not liable to obstructions and opakeness. We may likewise observe, that the optic nerve and crystalline lens are larger than in other animals, that the choroides is composed of two separate membranes, and that all these parts are differently modified and arranged, according to the manners

Physiology
and
Habitudes
of Fishes.

and habits of different species. Those fishes which undertake long voyages, and traverse much space in a short time, as the trout, salmon, salvelin, &c. have the conformation of the eye like that of birds; whose sight is very acute. Were we, indeed, to form our judgement of the power of vision in fishes merely from the external appearance of their eyes, we should conclude, that it is far from perfect, and that the small convexity of the cornea would occasion very little refraction in the rays of light; but this defect is sufficiently compensated by the structure of the crystalline lens, which is almost spherical, and more dense than in terrestrial animals. In its natural state, it is transparent, and not much harder than a jelly; and it forms that little hard pea-like substance which is found in the eyes of fishes after boiling. As the rays fall on this convex humour, undergo a powerful refraction, gradually approach one another, and unite at the axis of the eye, where they form their impressions. In most fishes the eyes are naked; but those of the skate tribe are distinguished by a digitated curtain, which hangs over the pupil, and which may exclude the light when the animal rests; and, in the genera *Gadus* and *Blennius*, the eyes are covered with an internal nodulating membrane.

That fishes possess the sense of *hearing*, has been almost entirely maintained and denied by the most celebrated naturalists, since the days of Aristotle. Among the moderns, Artedi, Linnæus, and Gowan have contended for the non-existence of this faculty, although some very ordinary facts naturally lead to an opposite conclusion. It is well known that fishes are affected by noise, and that they seem to be alarmed at loud explosions. On the coast of Brittany, they are frequently chased into nets by the sound of a drum; in China, by that of the *tan-tan*; and in ponds, they have been taught to assemble at the ringing of a bell. These sounds, however, it has been alleged, produce certain changes or vibrations in the water, which are *seen* by the animals, or which affect them in some way different from acting on the organ of hearing, an organ which naturalists and anatomists had long laboured in vain to discover. As the eruptions of Etna are sometimes *felt* at Malta, and an earthquake will sometimes visibly agitate the sea, at the distance of many leagues, it is supposed that smaller commotions in the atmosphere may communicate similar impressions to the finny tribes, independently of the medium of hearing. The laborious Klein spared no pains in searching for some hidden organ, by which he hoped to demonstrate that fishes are not more destitute of the faculty of hearing than other animals; but though his investigations proved fruitless, we are indebted to him for many curious observations on the number and figure of the small bones which are to be found in the head of various species. Geoffroi also made some important discoveries, but without arriving at decisive results. At length, the abbé Nolle proved, that water is a conductor of sound, and that even the tones and articulation of the human voice may be transmitted through its medium. All that now remained to set the question completely at rest, was to detect the parts of the auditory organ in fishes, and these the celebrated Camper has distinctly revealed in consequence of numerous dissections. For his particular description of the figure and mechanism

Physiology and Habitudes of Fishes. of the whole apparatus, we must refer our readers to the seventh volume of the Harlem Memoirs, and to a paper which he has inserted in one of the volumes of the *Journal des Sçavans Etrangers*. Suffice it for the present to note, that this curious organ is contained in the cavity of the head, and that it consists of three semicircular, cartilaginous canals, and an elastic bag, which includes one or two very moveable ossicles, floating in a jelly more or less thick, and slightly adhering to the contiguous parts. The moment that the vibration of the water, which is analogous to that of the air, is communicated to the fish's head, the impression is transmitted to the ossicles, which, acting in the ratio of their mass multiplied by the force of the impulse, impart their movement to the whole of the elastic bag and to the semicircular canals. The sentient principle is more or less alive to the action of the ossicles on the nerves, that is to say, in Camper's own language, "that the fish perceives sound, but found peculiar to the watery element." Hunter, who observed the same organs in the head of fishes, remarks that their structure varies in different species. His minute and ingenious observations on this subject are published in the 77th volume of the Philosophical Transactions. "Fishes, particularly of the skate kind, (says Dr Shaw) have a bag at some distance behind the eyes, which contains a fluid, and a soft cretaceous substance, and supplies the place of the vestibule and cochlea: there is a nerve distributed upon it, similar to the *portio mollis* in man: they have semicircular canals, which are filled with a fluid, and communicate with the bag: they have likewise a *meatus externus*, which leads to the internal ear. The cod-fish, and others of the same shape, have an organ of hearing somewhat similar to the former; but instead of a soft substance contained in the bag, there is a hard cretaceous stone."

Touch. The sense of *touch* is probably very imperfect in fishes, because it results from the contact and immediate application of the surface of some object to that of the animal, and all parts of the body are not equally fit to be applied to the surface of foreign substances. The hand alone, which is divided into several flexible and moveable parts, and is capable of being applied to different portions of the same surface, at the same time, seems peculiarly destined to convey the ideas of size and form, and even *it* would ill discharge such an office, if its contact with objects should be intercepted by any intermediate substance, as hair, feathers, shells, scales, &c. A rough and hard skin blunts the sense of touch, while a fine and delicate one renders it more lively and exquisite. Hence, we may presume, that fishes, which are destitute of palmated extremities, are incapable of recognizing the forms of bodies. Besides, as they are invested with a rough skin, which is frequently covered with tubercles, or numberless scales, they appear to be unsusceptible of that delicacy of feeling which nature has bestowed on many of the quadrupeds.

Taste. In the mouth of man, and of those animals which are endowed with sensibility of *taste*, there are numberless nervous papillæ, large, porous, constantly supplied with an abundance of lymph, and covered with a delicate skin, or inserted in sheaths of very unequal lengths. The savourous matters are arrested by these asperities, diluted by the lymph, and absorbed by the pores, which convey them to the nervous papillæ, on

Physiology and Habitudes of Fishes. which they act as stimulants. The tongue is the principal seat of this system of organs, and is extremely susceptible of impression, being composed of fleshy fibres, encompassed by a medullary tissue. In fishes, however, few pores have been discovered in the interior region of the mouth, the lymph is constantly carried off by the passage of the water, the tongue is sometimes imperfect and sometimes cartilaginous, and the palate is generally hard and bony. If to these circumstances we add the want of mastication, we may justly infer, that fishes are nearly destitute of the discriminating powers of taste. Accordingly, they are remarked for voracity, rather than for particular relishes; and they will often swallow substances which can afford them no nourishment.

Smelling. The organ of *smelling*, on the other hand, is large; and the animals have a power of contracting and dilating the entry to it as they have occasion. All have one or more nostrils; and even those which have not the holes perceptible without, yet have the proper formation of the bones for smelling within. The olfactory nerves, which are extended over the nostrils, are probably the instruments by which they are enabled to distinguish their food. A fish will discover a worm that is thrown into the water, at a considerable distance; and that this is not done by the eye, is manifest from the consideration, that after the same worm has remained for some time in the water, and lost its smell, no fishes will come near it; but if you make several little incisions into it, so as to let out more of the odoriferous effluvia, the creatures again approach it. "We may frequently observe them, (says the intelligent naturalist quoted above) allowing themselves to be carried down with the stream, that they may ascend again leisurely against the current of the water; thus the odoriferous particles swimming in that medium, being applied more forcibly to their organs of smell, produce a stronger sensation."

3. Motion.

Motions of fishes extremely rapid. Most fishes present us with the same external form, being sharp at either end, and swelling in the middle, whereby they are enabled to traverse their native fluid with greater ease and celerity. We wisely endeavour to imitate this peculiar shape in the construction of vessels designed to sail with the greatest swiftness; yet, the progress of a machine moved forward in the water by human contrivance, is nothing to the rapidity of an animal formed to reside in that element. The large fishes are known to overtake a ship in full sail with the greatest ease to play round it, without effort, and to outstrip it at pleasure. The flight of an arrow is not more rapid than the darting of a tunny, a salmon, or a gilt-head, through the water. It has been calculated that a salmon will glide over 86,400 feet in an hour, and 24 feet in a second, that it will advance more than a degree of the meridian of the earth in a-day, and make the tour of the world in the course of some weeks. Every part of the body seems exerted in this dispatch; the fins, the tail, and the motion of the whole back-bone assist progression; and it is to that flexibility of body which mocks the efforts of art, that fishes owe their great velocity.

The chief instruments in a fish's motion are its fins, Instrumental air-bladder, and tail. With at least two pair, and three of motion.

Physiology
and
Habitudes
of Fishes.

single fins, it will migrate with great rapidity, and take voyages of a thousand leagues in a season, without indicating any visible symptoms of languor or fatigue. But it does not always happen, that fishes which have the greatest number of fins, have also the swiftest motion: the shark, for example, which is reckoned one of the swiftest swimmers, wants the ventral fins; while the haddock, which has its full complement of fins, is more tardy in its progress.

The fins serve not only to assist the animal in progression, but in rising or sinking, in turning, or even in leaping out of the water. To answer these purposes, the pectoral fins, like oars, serve to push the animal forward, and have, therefore, not unaptly, been compared to the wings of a bird. By their help and continued motion, the flying-fish is sometimes seen to dart out of the water, and to fly above a hundred yards. The pectoral fins likewise serve to balance the head, when it is too large for the body, and prevent it from tumbling prone to the bottom, as happens to large-headed fishes, when the pectoral fins are cut off. The ventral fins, which lie flat in the water, in whatever situation the fish may be, serve rather to raise or depress the body, than to assist its progressive motion. The dorsal fin acts as a poise, in preserving the animal's equilibrium, at the same time that it aids the forward movement. The anal is designed to maintain the vertical or upright position of the body.

By means of the air-bladder, fishes can increase or diminish the specific gravity of their body. When they contract it, or press out the included air, by means of the abdominal muscles, the bulk of the body is diminished, its weight in proportion to the water is increased, and the fish swims easily at a great depth. On relaxing the operation of the abdominal muscles, the swimming-bladder again acquires its natural size, the body increases in bulk, consequently becomes lighter, and enables the fish to swim easily near the surface. So fishes which have no air-bladder, or those whose bladder has been injured, keep always at the bottom.

Lastly, the tail may be regarded as the directing instrument of motion, to which the fins are only subservient. To illustrate all this by a simple experiment—If we take a live carp, and put it into a large vessel, the fish, when in a state of repose, will be seen to spread all its fins, and to rest on the pectoral and ventral near the bottom; and, if it fold up either of its pectoral fins, it will incline to the side on which the folding takes place. When it desires to have a retrograde motion, striking with the pectoral fins, in a contrary direction, effectually produces it. If it desires to turn, a blow from the tail sends it about; but if the tail strike both ways, the motion is progressive. If the dorsal and ventral fins be cut off, the fish reels to the right and left, and endeavours to supply its loss by keeping the rest of its fins in constant exercise. If the right pectoral fin be cut off, the fish leans to that side; and, if the ventral fin on the same side be cut away, it loses its equilibrium entirely. When the tail is removed, the fish loses all motion, and abandons itself to the impulse of the water.

The slimy glutinous matter which is secreted from the pores of most fishes, not only defends their bodies from the immediate contact of the surrounding fluid, but facilitates their progressive motion.

Physiology
and
Habitudes
of Fishes.

The pelagian tribes of fishes, which traverse large portions of the ocean, as the salmon, tunny, and several species of *coryphæna*, *gadus*, *sparus*, *sciæna*, &c. are furnished with large and strong fins, to enable them to struggle against large waves and rapid currents; whereas those which frequent the shores and fresh waters have their fins smaller and weaker; while those with soft fins seldom expose themselves to the fury of the storm, and confine themselves to depths that are not affected by the most impetuous winds. A more ample explanation of these particulars will be found in Borelli's work *de Motu Animalium*.

Notwithstanding the astonishing agility of their movements, fishes often remain in a state of inactivity and stupor, till roused by the calls of hunger or love, or stimulated by the dread of an approaching enemy. The periodical and extensive migrations of certain tribes of fishes are not irreconcilable with this remark, since the want of food, or the important occupation of breeding, may induce them to change their station. But we cannot give implicit credit to the relations of those naturalists, who, copying from one another, affect on this subject the language of wonder and mystery. In regard to the reputed migrations of immense shoals of herrings from the polar regions to the south of Europe, and which have been generally ascribed to the depredations of the cetaceous tribes, we may be allowed to ask, why these small fishes proceed some hundred leagues beyond the reach of their enemies, and why they return in winter to the very haunts of their gigantic destroyers? If it be alledged, that these monstrous animals drive them into bays and inlets; why do they equally abound in the North sea and the Baltic, which are not frequented by whales? If mere want of food compels the herrings to detach their crowded colonies; how happens it that the migration always takes place at the same time, and at the same season of the year? It is difficult to conceive, that their stock of provisions should regularly be exhausted at the year's end? Besides, if the arctic pole be the native country of the herrings, as has been usually supposed, they should make their appearance, like birds of passage, in numerous troops at certain seasons, and very few or none should be seen during the rest of the year. Yet it is well known, that great quantities of them are caught in Norway, during the whole of summer; in the same country, and in Swedish Pomerania, the fishery is very productive from January to March; on the coast of Gothland, from October to December; in the north of Holland, in February, March, and April; and in Sweden, in the middle of winter. That part of the migrating shoal regularly directs its course to the coast of Iceland, is an assertion unsupportable by respectable testimony. Horrebøw, who passed some years on that island, affirms, that a single herring will sometimes not be seen for many years; and Olafsen, Ægidius, Othofabricius, and others, corroborate his assertions.

To account, then, for the movements of the herring, cod, tunny, anchovy, &c. it is in vain to have recourse to the rapacity of the whale, or to the urgent pressure of hunger; and least of all should we adopt the marvellous tales of periodical voyages, performed with the utmost order and exactitude. M. Bloch explains in a much more simple and natural manner the arrival and disappearance of the respective shoals. According to him, herrings

Reputed
migration
doubted.

Physiology and Habitudes of Fishes.

Physiology and Habitudes of Fishes.

herrings have the same propensity as other fishes, and usually live in the depths of the water, till stimulated by the desire of reproducing their species. They then quit their retreat, and suddenly appear in places where they were not formerly seen: and, as the spawning time occurs sometimes sooner, and sometimes later, according to the temperature of the water, and the age of the fishes, we can easily conceive why those species which are reputed migratory, should be observed at different times. Those sea fishes which ascend rivers in spring, only return to their several haunts in autumn. The herrings are, doubtless, guided by an analogous instinct; and if we may be allowed to suppose, that they sometimes spawn more than once in the course of the year, we shall be at no loss to account for the circumstances of their wandering.

on minute invisible insects, or be endowed with the power of decomposing water, and of converting its elements into the means of subsistence. Much, in fact, remains to be discovered on the interesting subject of the food of fishes; for while the incessant craving and gluttony of some are obvious to the most superficial observation, the methods by which others are maintained in existence have only been surmised by conjecture. Meanwhile, it is of importance to remark, that in the water, as on the land, nature has nicely adjusted the balance of destruction and renovation, thus providently guarding against an overwhelming accumulation of putrid carcases, and multiplying, at the same time, the sources and centres of vitality and animal enjoyment.

5. *Reproduction.*

Most fishes are voracious and voracious.

Most fishes are viviparous.

4. *Nourishment.*
Among fishes, as among quadrupeds and birds, some search for their food in the mud; others live on worms, insects, or marine plants. The former have their anterior extremity adapted to the extraction of peculiar juices from the earth; the latter have the conformation of their jaws, or teeth suited to the capture and destruction of their appropriate prey. The greatest number of species, however, are carnivorous and extremely voracious, subsisting chiefly on other fishes, and frequently not sparing even their own offspring. When taken out of the water, and almost expiring, they will often greedily swallow the very bait which lured them to their ruin. In the sequel, we shall have occasion to adduce some striking instances of the violent and indiscriminate appetite of several fishes. The digestive power of their stomach is no less remarkable, and seems to increase with the quantity of food received into it. This food, though reduced to a gelatinous state, usually preserves its natural form; a circumstance which leads us to conclude, that the process of digestion is performed by the solvent power of some particular menstruum, and not by any trituration.

In most, if not in all fishes, there is a difference in sex, though Bloch and others make mention of individuals, which seemed to unite the two sexes, and to be real hermaphrodites. The number of males, it has been remarked, is about double that of females; and were it not for this wise provision of nature, a large proportion of the extruded eggs would remain unfecundated. A few species, indeed, as the eel, blenny, &c. are viviparous; but by far the greater number are produced from eggs. These last compose the roe or ovaries of the females, which lie along the abdomen. The milt of the males is disposed along the back-bone, in one or two bags, and consists of a whitish glandular substance, which secretes the spermatic fluid. Though the history of the generation of fishes be still involved in considerable obscurity, it seems to be ascertained, that no sexual union takes place among the viviparous kinds, and that the eggs are fructified after exclusion. They are of a spherical form, and consist of a yolk, a white part, and a bright crescent-like spot, or germ. The yolk, which is usually surrounded by the white, is round, and not placed in the middle, but towards one of the sides; and the clear spot, or embryo, is situated between the yolk and the white. In this spot there is observable, on the day after fecundation, a moveable point, of a somewhat dull appearance. On the third day, it assumes the appearance of a thickish mass, detached on one side, and on the other strongly adhering to the yolk, and presenting the contour of the heart, which, at this period, receives an increase of motion, while the disengaged extremity, which forms the rudiments of the tail, is perceived to move at intervals. On the fourth day, the pulsations of the heart and the movements of the whole body occur in quicker succession. On the fifth, the circulation of the humours in the vessels may be discerned, when the fish is in a particular position. On the sixth, the back-bone may be distinctly recognised. On the seventh, two black points, which are the eyes, and the whole form of the animal, are visible to the naked eye. Although the yolk gradually diminishes as the embryo enlarges, the included animal cannot yet stretch itself at length, and makes a curve with its tail. Its motions are then so brisk, that when it turns its body, the yolk turns with it; and these motions become more and more frequent, as the moment of birth, which happens between the seventh and ninth day, approaches. By repeated strokes of the tail, the covering of the egg at length

but can bear abstinence.

Fishes, in general, manifest a predilection for what ever they can swallow possessed of life. Some that have very small mouths, feed on worms and the spawn of other fish: others, whose mouths are larger, seek larger prey; it matters not of what kind, whether of another or their own. Those with the largest mouths, pursue almost every thing that has life; and often meet each other in fierce opposition, and the victor devours his antagonist. Thus are they irritated by the continual desire of satisfying their hunger; and the life of a fish, from the smallest to the greatest, is but one scene of hostility, violence, and evasion. The smaller fry, which stand no chance in the unequal combat, resort to those shallows, where the greater are unable or too heavy to pursue. There they become invaders in turn, and live on the spawn of large fishes, which they find floating on the surface of the water, till they are imprisoned and leisurely devoured by the mussel, oyster, or scallop, which lie in ambush at the bottom.

Notwithstanding the astonishing voracity of fishes, some of them are capable of suffering at least the apparent want of food for a long time. This is particularly the case with the gold and silver fishes which are kept in vases, and which seem to enjoy perfect health, though deprived of sustenance for months. But they may probably feed

Physiology and Habitudes of Fishes.

Physiology and Habitudes of Fishes.

length gives way, and the fish comes forth, first by the tail, redoubling its efforts, till it detach its head; and then it moves nimbly, and at liberty, in its new element. Such, at least, are the results of some particular observations: but it is obvious, that they must vary considerably according to circumstances; particularly, that the spawn must continue in the egg state in some species longer than in others, and this in proportion to the animal's size. The embryo salmon, for instance, continues in the egg from the beginning of December to the beginning of April, and the carp not above three weeks.

Fishes have different seasons for depositing their spawn. Some which live in the depths of the ocean, are said to choose the winter months; but, in general, those with which we are acquainted, choose the hottest months in summer, and prefer such water as is somewhat tepid by the beams of the sun. They then leave the deepest parts of the ocean, which are the coldest, and shoal round the coasts, or swim up the fresh-water rivers, which are warm as they are comparatively shallow, depositing their eggs where the sun's influence can most easily reach them, and seeming to take no farther charge of their future progeny.

Of the eggs thus deposited scarcely one in a hundred brings forth an animal, as they are devoured by all the lesser fry which frequent the shores, by aquatic birds near the margin, and by the larger fish in deep water. Still, however, the sea is amply supplied with inhabitants; and, notwithstanding their own rapacity, and that of various tribes of fowls, the numbers that escape are sufficient to relieve the wants of a considerable portion of mankind. Indeed, when we consider the fecundity of a single fish, the amount will seem astonishing. If we should be told, for example, that a single being could in one season, produce as many of its kind as there are inhabitants in England, it would strike us with surprize; yet the cod annually spawns, according to Lewenhoeck, above nine million of eggs contained in a single roe. The flounder is commonly known to produce above one million; and the mackarel above five hundred thousand; a herring of a moderate size will yield at least ten thousand; a carp, of 14 inches in length, contained, according to Petit, two hundred and sixty-two thousand, two hundred and twenty-four; and another, 16 inches long, contained three hundred and forty-two thousand, one hundred and forty-four; a perch deposited three hundred and eighty thousand, six hundred and forty; and a female sturgeon, seven million, six hundred and fifty-three thousand, two hundred.—The viviparous species are by no means so fruitful; yet the blenny brings forth two or three hundred at a time, all alive and playing round the parent together.

Number of eggs im- mense.

Some naturalists have suspected, that there are fishes which undergo certain metamorphoses in the early period of their existence, like the tadpoles of frogs. Mademoiselle Merian, in her splendid work on the Insects of Surinam, even describes frogs, which are transformed into fishes. Spelmann makes mention of aquatic animals of an ambiguous nature, which he met with at all seasons of the year, and which he terms *proteufes*; and Schranck and Laurenti have remarked in the Tyrolian lakes particular races of animals, which seem to form a gradation between tadpoles and branchiostegous

fishes. Perhaps they are larvæ, or imperfect animals, whose development is still obscure; yet it is not improbable that some fishes may undergo transformations analogous to those of young frogs and salamanders. The history of the *ostracion* and *diodon* families will warrant such a supposition; and the *siren lacertina* of Linnaeus seems to be alike connected with reptiles and fishes.

For several curious and interesting experiments relative to the artificial fecundation of the spawn of fishes, we must refer our readers to M. Jacobi's Memoir, inserted in the Berlin Transactions for 1764. By pressing the contents of the milt of salmon and trout on the spawn of these fishes, he succeeded in rendering the ova fruitful, and obtained live fish. Among these were several monsters, such as trouts with two heads, others in the form of a cross, &c. none of which lived beyond six weeks, exhausting in that time the juices of their own stomach, and the yolk of the egg to which they were attached.

6. Duration.

It is extremely difficult to ascertain the precise term which nature has assigned to the existence of those creatures which inhabit a medium different from our own. It is probable, that the life of fishes which escape the numerous snares that are laid for them, is considerably longer than their mere size would seem to indicate. In the first stages of their existence, their growth is, no doubt, rapid; but their fibres quickly become hard, and less susceptible of extension. When newly excluded from its egg, the fish grows four lines in the short space of eight hours; but three weeks at least elapse, before it acquire an additional line. Nor is the rate of growth at all equal in different species. Thus a carp attains only to the length of six or seven inches in three years, and to the weight of twelve pounds in ten years. The growth of the tench is still more tardy, since twelve years are required to give it the length of twenty inches.

There have been two methods devised for determining the age of fishes, the one, by the circles of the scales, the other, by the transverse section of the backbone. When a fish's scale is examined through a microscope, it will be found to consist of a number of circles, one within another, in some measure resembling those which appear on the transverse section of a tree, and which are supposed to afford the same information. For, as in trees, we can tell their age by the number of their circles, so in fishes, we can tell theirs by the number of circles in every scale, reckoning one ring for every year of the animal's existence. By this method, the count de Buffon found a carp, whose scales he examined, to be not less than a hundred years old. Gesner adduces an instance of one of the same age, and Albertus of one more than double that period.—The age of the skate and the ray, which are destitute of scales, may be known by the other method, which consists in separating the joints of the back-bone, and then minutely observing the number of rings which the surface where it was joined exhibits. But whatever degree of precision we may attach to such evidence, we have no reason to doubt the great age of some fishes. The persons who have ponds often know the oldest by their superior size, and other indications. The carp which

Great age of some fishes.

were bred in the ditches of Pont-Chartrain, are quoted by Buffon, as exceeding a hundred and fifty years; and those in the royal gardens of Charlottenburg, in Prussia, are said by Bloch to have their heads overgrown with moss. Ledelius alleges, that in some pools in Lusatia there are carp about 200 years old. At Manheim, there is the skeleton of a pike, 19 feet in length, and which is said to have weighed, when alive, 350 pounds. It was caught at Kayserlautern, in 1497; and a Greek inscription on a brass ring, inserted at the gills, announced that it had been put into the pond by the emperor Frederick II. that is to say, 267 years before it was taken. Some species, however, are known to have a much shorter existence; thus, the eel usually lives about 15 years; the bream and the tench, from 10 to 12, and the fifteen-spined stickle-back seldom survives two.—The comparative simplicity of their structure, the flexibility of their frame, the strength of their digestive power, their want of sensibility, and the equal

temperature of the element which they inhabit, probably all contribute to the longevity of fishes. The same causes may, perhaps, exempt them from many diseases which are incident to other races of animals. Yet we know for certain, that they are occasionally subject to indisposition and distempers. Before the spawning season, they undergo a change of their external covering, analogous to *moulting* amongst the feathered tribes; their scales and skins are renewed, and the colours of the more beautiful kinds assume more fresh and vivid hues. But this annual change is not effected without evident symptoms of languor, decline, and suffering. Some kinds of salmon trout are liable to a leprous affection, the carp to smallpox, and the eruption of small tumours on the head and back, the perch to dropsy, eels to a cutaneous disorder which often proves fatal, and most species to ulcerated livers, or injured viscera, from the worms and insects of various descriptions which multiply within them.

CHAP. IV. SYSTEMATIC EXPOSITION OF FISHES.

THE Linnæan orders of fishes have been instituted from the situation, presence, or absence of the ventral fins.

1. Such as are entirely destitute of these fins, are termed *pisces apodes*, *apodal* or *footless* fishes.

2. The *jugulares*, or *jugular*, are those which have ventral fins, placed more forward than the pectoral fins, or under the throat.

3. The *thoracici*, or *thoracic*, include those whose ventral fins are placed immediately under the pectoral fins, or on the breast.

4. The *abdominales*, or *abdominal*, comprise those whose ventral fins are situated behind the pectoral fins, or on the abdomen.

5. There still remains a particular tribe, denominated *cartilaginei*, which, as their name imports, have a cartilaginous instead of a bony skeleton. This tribe was by Linnæus separated from the rest, on the mistaken idea, that the individuals which compose it were furnished both with lungs and gills, and should be ranked in the class of amphibious animals.

The *genera* which pertain to the preceding orders are determined by the number of rays in the branchiostegous membrane, the condition of the teeth, the figure of the body, and of other remarkable parts.

The characters of the *species* are taken chiefly from the number of rays in the fins, which differs in the different species. But, as the precise enumeration of these rays is sometimes a matter of difficulty, and, as they are likewise subject to variation, it is necessary to have recourse to other marks, and to adopt, as subsidiary characters, the form and situation of particular fins, the proportion of the head to the body, the condition of the lateral line, the number of the vertebræ and ribs, &c.

I. APODAL.

THE fishes of this order approach very near to the amphibia, and some of them even resemble the serpent tribe. They have a smooth slippery skin, which is, in

general, naked, or covered in some species only, with small, soft, and distant scales. Their body is long and slender; they have teeth in the jaws, and live in the sea; but some are found in rivers and standing waters. They feed on other animals.

Genus I. MURÆNA.

Muræna.

Head smooth; nostrils tubular; eyes covered by the common integument; gill membrane ten-rayed; body nearly cylindrical, smooth, and slippery; dorsal, caudal, and anal fins united; spiracles behind the head or pectoral fins.

Roman muræna, or *murex*. No pectoral fins; body eel-shaped, and variegated; spiracle on each side the neck.—The colour of this fish is a dusky-greenish brown, diversified with dull yellow patches, and forming a kind of obscure net-work. The head is rather small; the mouth moderately wide, and the teeth sharp. The fins are of a dusky colour, with whitish spots. The murex is capable of living with equal facility in fresh or salt water, though principally found in the latter, especially on the coasts of the Mediterranean. It attains to a size at least equal, if not superior to the common eel, which it much resembles in its manners and voracity. The Romans prized it as an exquisite luxury, and kept it in appropriate reservoirs.

Snake eel, or *sea serpent*. Snout lengthened; tail pointed, and sinless; body round. The head of this species is long and slender, the gape very wide, the teeth very sharp, and the colour a very pale yellowish brown above, and bluish white beneath. It is a native of the Mediterranean and northern seas, where it often arrives at a very considerable size, and has probably given rise to the marvellous tales of huge sea serpents in the northern ocean.—The *anguilla ophis*, or *spotted eel* of Shaw, seems to be a distinct species, or else a marked variety, being spotted with brown, and chiefly found in the Indian seas, though sometimes also in the Mediterranean, &c.

Common eel.—The lower jaw longer than the upper. *anguilla per*,

Apodal
Fishes.

per; body olive-brown above, somewhat silvery beneath. The figure and appearance of this species are too well known to require a particular description. It is a native of almost all the waters of the ancient continent, frequenting not only rivers but stagnant pools, and occasionally salt marshes and lakes. In spring it is found even in the Baltic and other seas. In some places near the mouths of the Baltic, they are taken in such abundance that they cannot be used fresh, but are smoked and salted, and conveyed by waggon-loads into Saxony, Silesia, &c. We are told that 2000 have been taken in Jutland at a single sweep of the net, and 60,000 in the Garonne in one day, by a single net. It is generally alleged that the eel cannot bear the water of the Danube; and it is rarely found either in that river or the Wolga, though very common in the lakes and rivers of Upper Austria. Its ordinary size is from two to three feet, though it has been known to attain to the length of six feet, and to weigh fifteen pounds. Dale and others mention some of uncommon magnitude, but which were probably congers. Though impatient of heat and cold, the eel can live longer out of the water than any other fish, and is extremely tenacious of life, as its parts will move a considerable time after it has been skinned, and cut into pieces. It sometimes quits the water, and wanders about meadows and moist grounds in quest of particular food, as snails, worms, &c. It is also said to be fond of new-sown peas, and to have sometimes taken refuge from severe frosts in adjoining hay-ricks. Its usual food consists of water-insects, worms, and the spawn of fishes. It will also devour almost any decayed animal substance. It is viviparous, producing its young about the end of summer; though both eggs, and ready-formed young are occasionally observed in the same individual. Its skin, which is proverbially slippery, from the large proportion of mucus with which it is furnished, serves, in some countries, from its toughness and pellucidity, as tackle for carriages, &c. and glass for windows. Though we learn from Athenæus, that the Sybarites exempted from every kind of tribute the vendors of eels, the Romans seem to have held this fish very cheap as an article of food. In modern times it is reckoned highly nutritious, though somewhat difficult of digestion, and hurtful when taken to excess.

conger.

Conger eel.—Two tentacula at the rostrum, the lateral line whitish and dotted. The first of these characters is not constant. But the conger may be distinguished from the common eel by other marks, such as its darker colour, larger eyes, its shorter lower jaw, and the greater size to which it usually attains. Specimens from the Mediterranean have sometimes been taken of the length of ten feet, and of the weight of more than a hundred pounds. It is likewise an inhabitant of the northern seas, and of those which surround some of the American islands. The conger is only an occasional visitant of fresh water, frequenting the mouths of rivers in spring. In the mouth of the Severn incredible quantities of the fry are taken in April, under the name of *elvers*. In its full-grown state the conger is also reckoned a useful article of food in many parts of Europe. The great quantities that are taken on the coast of Cornwall are chiefly exported to Spain and Portugal. Much of their abundant oil is drained away in the process of drying, the weight being re-

duced nearly eighty per cent. Congers are extremely voracious, preying on other fishes, and on various kinds of crustacea, particularly on the small crabs during their soft state after they have cast their shell.

Apodal
Fishes.

Southern muræna.—No pectoral fins; brown, with black variegations; depressed head and very turgid neck. This species, which inhabits the southern ocean, has a repulsive appearance. grows to a very considerable size, and affords excellent food.

echidna.

The *firen*.—Pectoral fins like hands with four fingers, gill membrane with three pinnatifid bones. This is the *firen lacertina* of former editions of the System of Nature. It is peculiar to the muddy swamps of South Carolina, preys on serpents, which it seizes and holds with its strong and firm teeth. It is sometimes a foot and a half in length; its heart has but one ventricle; it has ribs and a bony tail; and is so fragile, that if cast on the ground it breaks into three or four pieces.

The other species are, *colubrina*, *serpens*, *myrus*, *gut-tata*, *cæca*, *catenata*, *reticulata*, *africana*, *zebra*, *mele-agris*, and *viridis*.

Gen. 2. SYNBRANCHUS.

Synbran-
chus.

Body eel-shaped; no pectoral fins; spiracle single beneath the neck.

Marbled synbranchus.—Olive-brown, marbled with blackish spots; the body yellow beneath. Native of the fresh waters of Surinam. *marmoratus.*

Plain synbranchus.—Of a plain unvariegated brown colour. A native of Surinam. *immaculatus.*

Gen. 3. MONOPTERUS.

Monop-
terus.

Body eel-shaped; nostrils placed between the eyes; fin caudal.

Javan monopterus.—Livid brown or blackish, with a very sharp-pointed tail. This fish, which has the appearance and habits of a muræna, is a native of the Indian seas, and very common about the coasts of Java, where it is considered as an excellent food. *javanicus.*

Gen. 4. GYMNOTUS.

Gymnotus

Head with lateral opercula; two beards or tentacula on the upper lip; eyes covered by the common integument; gill membrane five-rayed; body compressed, without dorsal fin (in most species), but carinated by a fin beneath.

Carapo gymnotus.—Brown, with the vent-fin of the length of the attenuated tail, and the upper jaw longer than the lower. This fish is a native of the American seas, and is said to be most frequent about the coast of Surinam. Its ordinary length is from one to two feet. It is reckoned excellent by the South Americans. *carapo.*

Electrical gymnotus, or *cramp-fish*.—Without scales or dorsal fin; the caudal very obtuse, and joined to the anal fin. This fish bears a considerable resemblance to a large eel, though somewhat thicker, and commonly of an uniform blackish-brown. It was first announced to the philosophers of Europe on account of its remarkable electrical or galvanic properties, in 1677, by M. Richer, who was commissioned by the French Academy to make some mathematical observations in Cayenne. *electricus.*

Ap dal
Fishes.

enne. It would be tedious to recite all the remarks and experiments of succeeding observers, which conspire to prove the voluntary electricity of the gymnotus, which, however, occasionally exhibits some variations from the phenomena of common electricity. If a person touches the animal with one hand, in such a manner as to irritate it considerably, while the other is held at a small distance from it in the water, he will experience as strong a shock as from a charged Leyden phial. The shock is also readily communicated through a circle of eight or ten persons at once, the person at one extremity putting his hand in the water near the fish, while the other touches the animal. It is by this extraordinary faculty that the gymnotus supports its existence, the smaller fishes and other animals which happen to approach it being instantly stupified, and then falling an easy prey. It is even capable of depriving those who approach it in its native waters, of sense and motion. It is a native of the warmer regions of Africa and America, in which last it inhabits the larger rivers, particularly those of Surinam. In Africa, it is said to occur chiefly in the branches of the Senegal. In the 65th volume of the Philosophical Transactions, our readers will find an accurate description of the external form of the electrical gymnotus, by the late ingenious Dr Garden, and one equally accurate of its internal structure by the celebrated Mr John Hunter.

acus.

Needle gymnotus. Naked, with finless tail and belly, the anal fin of sixty rays, terminating before it reaches the tip of the tail. The only European species yet discovered, being a native of the Mediterranean, and described by Brunnich in his history of the fish of Martelle.

To the same genus belong *fasciatus*, *albus*, *albifrons*, *rostratus*, *notopterus*, and *asiaticus*.

Trichiurus.

Gen. 5. TRICHIURUS.

Head stretched forwards, with lateral gill covers; teeth ensiform, semi-sagittated at the points, the fore teeth the largest; gill-membrane seven-rayed; body compressed and ensiform, with a subulate and finless tail.

lepturus.

Silvery trichiurus, or *gymnogaster*.—The lower jaw longer than the upper. This fish is distinguished by the singularity of its shape, and the silver brilliancy of its colour. It is from two to three feet long, very voracious, and a rapid swimmer. In the pursuit of its prey, it sometimes leaps into small vessels which happen to be sailing by. It frequents the rivers and larger lakes of South America, and is also said to occur in some parts of India and China.

ndicus.

Indian or electrical trichiurus.—Jaws of equal length. Inhabits the Indian seas, and is said to possess a degree of electrical power.

Anarchi-
chas.

Gen. 6. ANARCHICAS.

Head somewhat obtuse; fore teeth both above and below, conical, diverging, strong; six or more grinders in the under jaw, and palate rounded; gill-membrane six-rayed, body roundish, caudal fin distinct.

lupus.

Wolf fish, *sea wolf*, or *ravenous wolf fish*.—Of a blackish gray colour, the sides, anal and caudal fins, and abdomen lighter. This is one of the few fishes

which have fore teeth and grinders. Of three specimens examined by Dr Black, one had six rows of grinders in the upper jaw, and as many in the lower; another had six rows above, and four below; and a third had five above, and three below. The disposition and structure of all the teeth are excellently adapted for breaking and comminuting the crabs, lobsters, scallops, large whelks, &c. which this voracious animal grinds to pieces, and swallows with the shells. When caught, it fastens on any thing within its reach. Schonfelde relates, that it will seize on an anchor and leave the marks of its teeth behind; and we are informed by Steller, that one which he saw taken on the coast of Kamtschatka, seized with great violence a cutlass with which it was attempted to be killed, and broke it in pieces as if it had been made of glass. The fishermen, dreading its bite, endeavour as soon as possible to beat out its fore teeth, and then kill it by striking it on the head. Its flat and grinding teeth are often found in a fossil state, and known by the name of *bufonites*, or *toad-stones*, to which many superstitious virtues were formerly ascribed. The sea wolf grows to a very considerable size, being frequently four, and sometimes even seven feet in length. It has small scales and a lateral line, though described by most naturalists as destitute of both. It commonly frequents the deep parts of the sea, in the northern regions of the globe, and some parts of the British coasts, approaching the shores in spring, to deposit its spawn among the marine plants. It swims slowly, and with the serpentine motion of the eel. Owing to its forbidding appearance, it is not generally brought to market; but the fishermen, the Greenlanders, and the Scotch find it excellent food. The latter call it the *sea cat*, and take off the head and skin before dressing it. The *strigosus* is now generally admitted to be only a variety of the preceding.

Apodal
Fishes.

Smaller wolf fish.—With very sharp cartilaginous *minor* teeth. Inhabits the coast of Greenland.

Panther wolf fish.—Yellow, or fulvous, spotted with *pantheri*-brown. In other particulars it agrees with the *com-nus*. Native of the northern seas.

Gen. 7. ODONTOGNATHUS.

Odontogna-
thus.

Mouth furnished with a strong moveable lamina or process on each side of the upper jaw; gill-membrane five-rayed.

Aculeated odontognathus.—Abdomen aculeated. *Naculeatus*. Native of the American seas, and common about the coasts of Cayenne, where it ranks among the edible fishes.

Gen. 8. TRIURUS.

Triurus.

Snout cylindrical; one tooth in each jaw; dorsal and anal fin extended beyond the tail.

Commersonian triple-tail.—The branchial orifice closed at pleasure by a valve. In general appearance and size it resembles a herring. It is distinguished from the whole class of fishes by the circumstance noted in the specific character. Native of the Indian seas.

commer-
fonti.

Gen. 9. AMMODYTES.

Ammo-
dytes.

Head compressed, narrower than the body; upper lip doubled, the lower jaw narrow, and pointed; teeth

Apodal
Fishes.

snail and sharp; gill-membrane seven-rayed; body long, roundish, with very small scales; tail distinct.

tobianus.

Sand lance, or sand eel.—The lower jaw longer than the upper. A native of the northern parts of Europe, commonly frequenting the coasts, and lying imbedded in the sand, in the summer months, at the depth of half a foot, or a foot, with its body rolled into a spiral form. In this situation it is taken at the recesses of the tide, either for bait, by the fishermen, or as an article of food, being regarded as a delicacy. It lives on worms and small fishes, not even excepting its own species; and it is itself preyed on by the porpoise, and larger fishes, particularly by the mackerel. Most of the older ichthyologists have erroneously represented it as destitute of scales, and Klein has improperly divided it into two species.

Ophidium.

Gen. 10. OPHIDIUM.

Head somewhat naked; teeth in the jaws, palate, and fauces; gill-membrane seven-rayed, patulous; body sword-shaped.

barbatum.

Bearded ophidium.—Four cirrhi on the lower jaw. This species, which is frequent in the Mediterranean and Red seas, grows to ten or twelve inches long, is of a silvery hue, with a shade of pink, and marked with irregular linear spots; its skin is covered with soft oblong scales, adhering at their anterior edge. According to Belon, the Romans prized its flesh, which is white, but rather coarse.

imberbe.

Beardless ophidium.—Jaws beardless; tail rather obtuse; in other respects, much allied to the former. Inhabits the Mediterranean, and has also been taken near Weymouth.

Viride, aculeatum, and masticembalus, the other species, are but imperfectly known.

Stromateus.

Gen. 11. STROMATEUS.

Head compressed; teeth in the jaws and palate; body oval, broad, and slippery; tail bifid.

fatola.

Striped stromateus.—Marked with transverse undulated bands. This species, which is beautifully variegated, inhabits the Mediterranean and Red sea, and is known to the modern Romans by its specific appellation.

paru.

Paru stromateus.—Gold-coloured back, and silvery abdomen. General size, that of a turbot. Much esteemed as a food. Native of South America and Tranquebar. The *cumarea* of Gmelin's Linnæus seems to be only a variety of this.

cinereus.

Ash-coloured stromateus.—Tail forked, the lower lobe longer than the upper. Native of the Indian seas, and served at table, as a dainty, under the name of *pampel*.

argenteus.

Silver stromateus.—With the lobes of the tail equal. Nearly allied to the preceding, a native of the same seas, and equally esteemed as an article of food.

niger.

Black stromateus.—Entirely of a blackish colour. This also frequents the Indian seas; but is seldom prepared for the table, on account of its colour and the circumstance of its feeding on wood-lice, which are sometimes found in its mouth.

Gen. 12. XIPHIAS.

Apodal
Fishes.

Xiphias.

Head with the upper jaw terminating in a sword-shaped snout; mouth without teeth; gill membrane eight-rayed; body roundish, and scaleless.

Common or Sicilian sword-fish.—The dorsal fin attenuated at the hind part. The body of the sword-fish is long, round, and gradually tapers towards the tail; the head is flattish, and the mouth wide, both jaws terminating in a point, but the upper stretched to a great distance beyond the lower, forming what is commonly called the *sword*, by which it pierces and kills the smaller kinds of fishes. It sometimes measures twenty feet in length, and is of an active and ravenous disposition. The method of taking it, described by Strabo, exactly agrees with the modern practice. A man ascends one of the cliffs that overhang the sea, and as soon as he spies the fish, gives notice by voice or signal of the course it takes. Another person in a boat climbs up the mast, and on seeing the fish, directs the rowers to it. The moment that he thinks they have got within reach, he descends and taking his spear in his hand, strikes into the fish, which, after wearying itself with its agitations, is seized and dragged into the boat. Its flesh is much esteemed by the Sicilians, who cut it in pieces and salt it. The pieces from the belly and tail are most esteemed, and the salted fins are sold under the name of *callo*. The sword-fish is frequently found in the Mediterranean, especially on the coasts of Sicily, where the male and female usually appear in pairs. It also occasionally occurs in the northern seas, and sometimes in the Pacific ocean; but Ælian erroneously asserts that it is at the same time a fresh water fish, and an inhabitant of the Danube.

Broad-finned sword-fish.—Distinguished from the preceding by a very broad back fin, and very long sharp-pointed thoracic appendages. Found not only in the Brazilian and East Indian seas, but also in the Northern ocean. It is said to have frequent combats with whales. The bottom of an East Indiaman was pierced by a fish of this species, in such a manner, that the sword was driven through almost to its base, and the animal killed by the violence of the effort. The wood, together with the sword imbedded in it, is now in the British Museum. When this species does not exceed four feet, it is considered as an eatable fish; but it is found of the length of twenty feet, and sometimes even much longer.

Short snouted sword-fish.—Blackish; with snout of middling length, and two bony tubercles on each side of the tail. Resembles the common sword-fish, except that the snout is much shorter and thicker.

Gen. 13. STERNOPTYX.

Sternoptyx

Head obtuse; mouth turning up; teeth very small; no gill-membrane; body compressed, without visible scales; breast carinated, and folded both ways; abdomen pellucid.

Transparent sternoptyx.—Silvery; with carinated breast, and pellucid abdomen; two or three inches long, broad, and compressed, the back rising into a sharp edge, and the abdomen terminating in a carina. Native of the American seas.

Gen. 14.

Apodal
Fishes.

Gen. 14. LEPTOCEPHALUS.

Head narrow; body very thin, and compressed; no pectoral fins.

Morrisi. *Morris lancee*, or *Anglesea morris*.—First discovered on the coast of Anglesea by Mr Morris, and described by Pennant under his name. Four inches in length; the head very small; the body extremely thin, and almost transparent.

Stylepho-
s.

Gen. 15. STYLEPHORUS.

Eyes pedunculated, standing on a short thick cylinder; snout lengthened, directed upwards, retractile towards the head by means of a membrane; mouth without teeth; gills three pair beneath the throat; pectoral fins small; dorsal, the length of the back; caudal, short, with spiny rays; body very long, compressed.

Chordatus. *Chordated stylephorus*.—Silvery; with an extremely long caudal thread. We shall here transcribe Dr Shaw's description of this very extraordinary species.

"The rostrum or narrow part which is terminated by the mouth, is connected to the back part of the head by a flexible leathery duplicature, which permits it to be either extended in such a manner that the mouth points directly upwards, or to fall back, so as to be received into a sort of case formed by the upper part of the head. On the top of the head are placed the eyes, which are of a form very nearly approaching to those of the genus *cancer*, except that the columns or parts on which each eye is placed, are much broader or thicker than in that genus; they are also placed close to each other, and the outward surface of the eyes when magnified, does not show the least appearance of a reticulated structure. The colour of the eyes, as well as of the columns on which they stand, is a clear chestnut brown, with a sort of coppery gloss. Below the head, on each side, is a considerable compressed semicircular space, the fore part of which is bounded by the covering of the gills, which covering seems to consist of a single membrane, of a moderately strong nature. Beneath this, on each side, are three small pair of branchiæ. The body is extremely long, and compressed very much, and gradually diminishes as it approaches the tail, which terminates in a string or process of an enormous length, and finishes in a very fine point. This string, or caudal process, seems to be strengthened throughout its whole length, or at least as far as the eye can trace it, by a sort of double fibre or internal part. The pectoral fins are very small, and situated almost immediately behind the cavity on each side the thorax. The dorsal fin, which is of a thin and soft nature, runs from the head to within about an inch of the tail, when it seems suddenly to terminate, and a bare space is left of about a quarter of an inch. I am, however, not altogether without my doubts whether it might not, in the living animal, have run on quite to the tail, and whether the specimen might not have received some injury in that part. From this place commences a smaller fin which constitutes part of the caudal one. The caudal fin itself is furnished with five remarkable spines, the roots or originations of which may be traced to some depth in the thin part of the tail.

The general colour of this fish is a rich silver, except on the flexible part belonging to the rostrum, which is of a deep brown; the fins and caudal process are also brown, but not so deep as the part just mentioned. There is no appearance of scales on this fish. From the very singular figure and situation of the eyes, I have given it the generic name of *stylephorus*, and as the trivial name cannot be taken from any circumstance more properly than from the extraordinary thread-like process of the tail, I have applied to it the title of *chordatus*. It is a native of the West Indian seas, and was taken between Cuba and Martinico, near a small cluster of little islands about nine leagues from shore, where it was observed near the surface. The whole length of this uncommon animal, from the head to the extremity of the caudal process, is about 32 inches, of which the process itself measures 22."

Jugular
Fishes.

II. JUGULAR.

THE fishes of this order have their ventral fins situated before the pectoral fins, and, as it were, under the throat. They are mostly inhabitants of the sea. Their body is sometimes covered with scales, and sometimes not. With a very few exceptions, they have spines in the dorsal and anal fins; and their gills have bony rays.

Gen. 1. CALLIONYMUS.

Calliony-
mus.

The upper lip doubled; eyes near each other; the gill-membrane six-rayed; two breathing apertures in the hind part of the head; opercula close; body scaleless; ventral fins very distant.

Gemmeous dragonet.—The first ray of the first dorsal *lyra*. fin as long as the body. In this beautiful species, the pupils of the eyes are of a rich sapphire, the irides of a fine flame colour; the pectoral fins light brown, and the body yellow, blue, and white. "The blue," says Mr Pennant, "is of an inexpressible splendour; the richest cœrulean, glowing with a gemmeous brilliancy; the throat black." Dr Tylon has described it, in the 24th volume of the Philosophical Transactions, under the improper appellation of the *yellow gurnard*. It grows to the length of 10 or 12 inches; the body is slender, round, and smooth; and the membranes of all the fins extremely thin and delicate. It is found as far north as Norway and Spitzbergen, and as far south as the Mediterranean, and is not infrequent on the Scarborough coasts, where it is taken by the hook, in 30 or 40 fathoms water. It is often found in the stomach of the cod fish. Its flesh is white, and well flavoured. Rondelet compares it to that of the gudgeon. Pontoppidan, who never saw it, asserts, with his usual credulity, that it can fly in the air to the distance of several musket shot.

Sordid dragonet.—The rays of the first dorsal fin *dracuncu-* shorter than the body. In most other respects, it agrees *lus*. with the preceding.

This genus likewise comprises *indicus*, *balkensis*, *ocellatus*, *sagitta*, and *japonicus*.

Gen. 2. URANOSCOPUS.

Uranosco-
pus.

Head depressed; rough and large, mouth turned up; the upper jaw shorted; gill-membrane papillary and deformed;

Jagular
Fishes.

dentated; with six rays, gill-covers membranaceous and ciliated; anus in the middle of the body.

Jagular
Fishes.*scaber.*

Bearded star-gazer.—Back smooth; usual length about 12 inches. The head is large, squarish, and covered with a bony case. The mouth is wide, and opens in an almost vertical direction. The eyes are situated very near each other on the top of the head. A long cirrus or beard extends beyond the lips, which are themselves edged with smaller ones; frequenting shallows near the shores; it lies concealed in the mud, exposing only the tip of the head, and waving its beards in various directions, and thus decoying the smaller fishes and marine insects, which mistake these organs for worms. It is said to sleep during the day. Is found chiefly in the Mediterranean. Its flesh is white, but tough, coarse, and meagre.

japonicus.

Japanese star-gazer.—Back rough, with a series of spinous scales. Body roundish; yellow above; white underneath. Native of the coasts of Amboyna.

Trachinus.

Gen. 3. TRACHINUS.

Head slightly rough, compressed; gill-membrane six-rayed; inferior plate of the gill-covers serrated; vent near the breast.

-draco.

Dragon weever. Somewhat silvery hue, with transverse yellowish streaks; the first dorsal fin black, and and five-rayed: of a lengthened shape, much compressed, and covered with small deciduous scales. The mouth and eyes, in respect of position, resemble those of the star-gazer. The usual length of this fish is from 10 to 12 inches. It frequently imbeds itself in the sand, and if trodden on, endeavours to wound the aggressor with the spines of its first dorsal fin. The punctures are very troublesome and painful, though it does not appear that the spines contain any poisonous matter. It feeds principally on marine insects, worms, and small fishes, and is very tenacious of life, being capable of existing many hours out of the water. From this circumstance the French call it *vive* and *viver*, which we have corrupted into *weever*. It frequents not only the Mediterranean, but the northern seas, and is found abundantly on the coasts of Holland and East Friesland. Its flesh is well flavoured, easy of digestion, and highly esteemed by the Dutch. The greater weever, described by Pennant, hardly deserves to be considered as a distinct species.

osbeckii.

Osbeckian weever. White, spotted with black; both jaws of equal length. Native of the Atlantic; found about the isle of Ascension, &c. and described by Osbeck in his voyage to China.

Gadus.

4. GADUS.

Head smooth; gill-membrane with seven round rays; body oblong, with deciduous scales; fins covered with a common skin; more dorsal and anal fins than one; the rays not prickly; the pectoral fins attenuated to a point.

* *With three dorsal fins, cirrhi at the mouth.*

azglefinus.

Haddock. Whitish; the tail bilobated, the upper jaw the longest. Another distinguishing character may be deduced from the large black spot on each side

above the pectoral fins. Superstition assigns this mark to the impression which St Peter left with his finger and thumb, when he took the tribute out of the mouth of a fish of this species, and which has been continued to the whole race. The haddock is usually of a moderate size, measuring about 18 inches or two feet in length, and the best for the table weighing from two to four pounds. It is found in the northern seas in prodigious shoals, visiting particular coasts at stated seasons, and for the most part attended by immense quantities of dog-fish, which, with seals, and other inhabitants of the ocean, are its constant devourers. Its food consists of small fishes, worms, crabs, and sea insects, and it fattens on herrings. In January, it deposits its spawn on the fuci near the shore, and is out of season till May. Its flesh is white, firm, delicate, and easy of digestion.

Doise. Varied, with an even tail, and upper jaw longest. Somewhat smaller than the haddock, seldom exceeding the weight of two pounds. Its colour is subject to vary with age and seasons. It inhabits the northern seas, the Baltic, and the Mediterranean. Otto Fabricius found in its stomach the sea-scorpion, sand-eel, crabs, and different species of sea-worms. It spawns in January and February, is taken both by the line and net, and is reckoned delicate eating.

Common cod.—Tail nearly equal, the first ray of the *morhua*. anal fin armed with a spine. This well-known and important species, which yields food and wealth to large districts of country, is found in immense shoals. It measures from two to three feet long, is of a cinereous colour, with yellowish spots above and white below, and has larger scales than the other species of this genus. The young are sometimes reddish, with orange-coloured spots. It feeds on sepia, crabs, and fishes, not even sparing its own species, catching at any small body it perceives moved by the water, and throwing up what it does not digest. Its range of climate lies principally between the latitudes 50° and 66°. The great rendezvous of cod is on the banks of Newfoundland, and the other sand-banks that lie off the coasts of Cape Breton, Nova Scotia, and New England. This fish likewise abounds off the Hebrides, Ireland, the coast of Holland, &c. and is generally fatter and most numerous where the greatest sea runs. In our seas they begin to spawn in January; though some continue in roe till the beginning of April. As they recover sooner after spawning than most other fish, it is customary to take some good ones all the summer. When out of season they are thin-tailed and lousy; and the lice chiefly fix themselves on the inside of their mouths. Those most esteemed for the table are of a middling size, and are chosen by their plumpness and roundness, especially near the tail, by the depth of the furrow behind the head, and by the regular undulated appearance of the sides, as if they were ribbed. The glutinous parts about the head lose their delicate flavour after it has been four-and-twenty hours out of the water. The fish itself dies on being removed from salt-water, or put into fresh. The fishermen are well acquainted with the use of the air-bladder, and dexterously perforate the living fish with a needle, in order to let out the air; for without this operation the fish could not be kept under water in the well-boats, and brought fresh to market. The sounds, when salted, are reckoned a delicacy,

Jugular Fishes. delicacy, and are often brought in this state from Newfoundland. The Icelanders prepare from this part of the fish a species of isinglass. Pennant makes mention of a cod taken at Scarborough in 1755, which was five feet eight inches in length, and weighed 78 pounds. But the general weight of these fish in the Yorkshire seas is from 14 to 40 pounds.

luscus. *Bib.*—The first ray of the ventral fin setaceous; about a foot long; body deep, and sides compressed; eyes covered with a loose membrane, so as to be blown up at the pleasure of the animal. The mouth is small, and under the chin is a cirrus about an inch long. Native of the European seas, and prized as an article of food.

barbatus. *Whiting pout.*—Seven punctures on each side of the lower jaw. Much deeper in proportion to its length than any of the genus, rarely exceeding a foot in length; and one of that size being nearly four inches in the broadest part. Inhabits the Mediterranean and northern seas; burrows in the sand, and feeds on the blenny, salmon, and even young crabs. Its flesh is white and delicate, but somewhat dry.

minutus. *Poor.*—Vent in the middle of the body. Little more than six inches long; a small beard on the chin, and the eyes covered with a loose membrane. The abdomen is lined with a black peritonæum. The poor is supposed to feed chiefly on worms and insects, or on the young and soft testaceous animals. It occurs in the Baltic and Mediterranean, and in some parts of the northern seas. It is reckoned a wholesome food, but is not fit for being salted or dried.

blennioides. *Blennoid gadus.*—With didactyle ventral fins. Has the habit of a whiting, and frequents the Mediterranean.

aida. *Saida gadus.*—Bluish, with brown back, white abdomen, and the second ray of the ventral fins terminating in a long bristle. Length about eight inches. Eatable, but dry and juiceless. A native of the White sea.

*** Three dorsal fins, and no cirrhi.*

ivens. *Green gadus.*—Greenish back and forked tail. Nearly resembles the pollack. Abounds in the northern seas.

merlanus. *Whiting.*—White; the upper jaw longest. Usual length about ten or twelve inches, and the largest seldom exceeding twenty. Specimens from four to eight pounds in weight have been taken in the deep water at the edge of the Dogger bank. It is a fish of an elegant make; the body rather long, and covered with small round silvery scales; the head and back are of a pale brown, and the sides are slightly streaked with yellow. Though found in the Baltic, it is much more numerous in the north seas, and appears in shoals on the coasts of Holland, France, and England, during the spring, keeping at the distance of from half a mile to three miles from the shore. The whiting feeds on small crabs, worms, and young fishes, and is particularly fond of sprats and young herrings, with which the fishermen generally bait for it, and in default of them, with pieces of fresh herring. This species begins to spawn at the end of the year, and continues to the beginning of February. Its flesh is white, tender, and delicate; but insipid when the fish is out of season. The chief time of the whiting fishery in France is in

January and February, though in England and Holland it is practised at a much later period.

Jugular Fishes. *Carbonarius.* *Coal-fish.*—The under jaw longest, the lateral line straight. When full grown, this species will frequently measure two feet and a half in length, and four or five inches in breadth, and is distinguished from its congeners by its very dark or black colour, though the young are brown or olive. It is of an elegant tapering shape, with a pretty large and forked tail. It inhabits the Baltic, the northern, and Mediterranean seas, and swarms round our rocky and deep coasts, particularly those of Scotland and the Orkneys, affording by its fry, subsistence to numbers of the poor. In its full grown state it is coarse food.

Pollack.—The under jaw longest, the lateral line curved. This species is broad, and of a brown colour; feeds chiefly on small fishes, especially launces; and seldom grows to a very large size, though some have been taken at Scarborough which weighed nearly 28 pounds. It is found in the Baltic and northern sea, and is very common on many of our rocky coasts. During summer it is seen frolicking on the surface of the water, and will bite at any thing that appears on the top of the waves. It is reckoned a good eating fish.

**** With two dorsal fins.*

Hake.—Beardless; the under jaw longest. Considerably lengthened, measuring from one to two feet; the body pale ash-colour on the back, and whitish on the sides and abdomen. This fish, which is very voracious, frequents the Mediterranean and northern seas. Its flesh is eatable and flaky, but little esteemed. It is salted and dried as food for the lower orders of people. One of the most considerable hake-fisheries is carried on about the coasts of Brittany, both by the hook and net. It is practised chiefly by night. The baits principally used are launces, sardines, and other small fishes.

Ling.—Bearded; the upper jaw longest. Long and slender; the sides and back sometimes of an olive hue, and sometimes cinereous; abdomen and ventral fins white, and the tail marked near the end with a transverse black bar, and tipped with white. Its ordinary length is from three to four feet, but it will sometimes grow to seven. It is an inhabitant of the northern seas, chiefly frequenting deep water, living on small fishes, shrimps, &c.; and depositing its spawn in June, among the fuci in oozy bottoms. In the Yorkshire seas, it is in perfection from the beginning of February to the beginning of May, during which season the liver is very white, and abounds with a fine flavoured oil. In many places ling is salted both for exportation and home consumption. An excellent isinglass is prepared from its sound.

Leverian gadus.—Somewhat cinereous, with ocellated whitish spots. Supposed to be a native of the Southern ocean.

Whitish gadus.—Bearded; ventral fins didactyle and elongated. Inhabits the Mediterranean.

Toad gadus.—Bearded; gill covers with three spines; the first dorsal fin with three rays. Native of the American and Indian seas.

Burbot.—Bearded; the jaws of equal length. Body much lengthened, somewhat cylindrical, of a brownish-yellow

Jugular
fishes.

yellow colour, and white below; but the shades vary at different seasons, and in different individuals. It is a fresh-water fish, affecting clear lakes and rivers; feeding voraciously on all the smaller fishes, as well as on frogs, worms, and aquatic insects; spawning in the finest season of the year, and rapidly attaining to full growth. The largest which are taken in England rarely exceed the weight of three pounds; but in some parts of Europe they are found of more than double that weight, and of the length of three feet and more. They occur in great plenty and perfection in the lake of Geneva, and are by no means rare in many places in Europe, Siberia, and India. In England it frequents the lakes of the northern counties, some of the Lincolnshire fens, and the rivers Witham and Trent. Its flesh is white, delicate, and easy of digestion; and its liver, when in season, is reputed a peculiar dainty. Aldrovandus makes mention of an old German countess who expended the greatest part of her income in the purchase of this dish. According to Black the burbot fishery once proved so productive in the Oder, that the fattest were cut into narrow thongs, which were dried, and used as matches.

mustela.

Wesel gadus, five-bearded cod, or whistle-fish.—Five cirrhi; the first dorsal fin incomplete. Grows to nearly 19 inches: feeds on the testaceous and crustaceous marine animals; deposits its spawn in autumn; is covered with mucus and very thin scales; and is of a brownish yellow colour, with black spots, and white below. The *tricirratus* and the *rufficus* are only varieties of this species.

cimbricus.

Cimbrian gadus.—Four cirrhi; first dorsal fin incomplete, with the first ray hastated. Nearly allied to the preceding. Native of the Atlantic and northern seas.

**** With one dorsal fin.

mediter-
raneus.

Mediterranean gadus.—Two cirrhi on the upper lip, and one on the lower. Native of the Mediterranean. Considered by La Cépède as a *blennius*.

brofne.

Torsk, or tusk.—Mouth bearded; tail oval and acute. About twenty inches in length; colour of the head dusky, of the back and sides yellow, of the belly white. Inhabits the northern seas, about the Shetland islands, and is not observed lower than the Orkneys. Both barrelled and dried, it forms a considerable article of commerce.

Blennius.

Gen. 5. BLENNIUS.

Head sloping, and covered with scales; gill-membrane six-rayed; body lanceolate; ventral fins with two spinelcfs proctfcs, the anal fin detached.

* With crested head.

gabrita.

Crested blenny.—Crest transverse, and skinny. Length about four or five inches; body long, compressed, and slippery. The crest erected or depressed at pleasure. Inhabits the European seas, and is sometimes found about the rocky coasts of Great Britain.

crijlatus.

Punarn.—Longitudinal setaceous crest between the eyes. Native of the Indian seas.

cornutus.

Horned blenny.—Simple ray between the eyes; and single dorsal fin. Inhabits the Indian seas.

ocellaris.

Ocellated blenny.—Blueish-green; subsalsiated with

brown broad dorsal fin, marked by a black ocellated spot. Length about six or eight inches. Inhabits the Mediterranean, among the rocks and sea-plants near the shore. Its flesh is meagre and not much esteemed.

Jugular
Fishes.

Fasciated blenny.—Two simple cirrhi between the eyes; the vent fin with 19 rays. Native of the Indian seas.

Salient blenny.—Brown, streaked with black, with a simple cirrhus on the head, and very large pectoral fins. Observed by Commerfon about some of the southern islands, particularly those of New Britain. It was seen swimming by hundreds; and, as it were, flying over the surface of the water, occasionally springing up and down with great rapidity among the rocks.

Gattorugine.—Small palmated fins on the eyebrows and nape. Inhabits the Mediterranean and Atlantic; and is reckoned eatable.

Supercilious blenny.—With palmated superciliary cirrhi, the lateral line curved. Grows to the length of about twelve inches; is viviparous; and inhabits the Indian seas.

Tentaculated blenny.—A simple cirrhus over the eyes, and a large ocellated spot on the back fin. Nearly allied to the horned species; and is found in the Mediterranean.

Simous blenny.—With a very small cirrhus over the eyes; dorsal fin united behind to the caudal fin, and crooked lateral line. Length about three inches and a half. Described by Swief, from a specimen in the museum of the Peterburgh Academy.

Hake blenny, or forked hake.—Nostrils somewhat crested, a cirrhus on the upper lip, and two dorsal fins. Grows to be eighteen inches long; inhabits the Mediterranean, and occurs on the coast of Cornwall. Improperly classed by Pennant among the gadi.

** Head plain, or crestless.

Trifurcated blenny, or trifurcated hake.—Brown with white lips, and three-rayed open ventral fins. Much allied to *gadus tau*; was first discovered by Mr Davies near Beaumaris, and described by Mr Pennant as a gadus.

Punctulated blenny.—Whitish, scaly, with irregular brown points, and elongated ventral fins. Head large; size about five inches. Described from a specimen in the Paris museum.

Smooth blenny.—The lateral line curved, and bifid. This species, which frequents the northern and Mediterranean seas, lying among stones and sea-weed, and occasionally entering the mouths of rivers, will grow to the length of seven or eight inches, but is usually much smaller. It bites fiercely, when first taken, and is so tenacious of life, that it may be kept 24 hours out of water. It feeds on smaller fishes and their spawn, as well as on shell-fish, sea-insects, &c. It is smooth, and covered with mucus. Being a coarse fish, it is principally used as bait.

Boscean blenny.—Olivaceous, with brown and whitish clouds; vent in the middle of the body. Very much allied to the preceding. Native of the American seas, and very common in the bay of Charlestown. It has its name from *M. Bose*, by whom it was discovered.

Gunnel, spotted blenny, or butter fish.—The dorsal fin marked with ten ocellated black spots. About nine or ten inches in length; head small, body compressed,

Thoracic Fishes. pressed, and the colour of the body yellow-brown, clouded and freckled with deeper specks. This species inhabits the Baltic, Mediterranean, and northern seas. Though coarse, it is often dried and eaten by the Greenlanders. The number of spots on the back fin varies from nine to twelve.

Ustularis. *Weasel blenny.*—The anterior dorsal fin three-rayed. Native of the Indian seas.

Viviparus. *Viviparous blenny.*—Two tentacula at the mouth. Is sometimes found of the length of a foot, or even of 15 inches. Of a somewhat slender form, with a smooth slippery skin, covered with small scales of a yellowish olive colour, paler beneath, and marked on the upper parts by several moderately large dusky spots, forming a kind of bars on the dorsal fin and over the back. The rays of all the fins are soft. This species is a littoral fish, frequenting the coasts of the Mediterranean, Baltic, and northern seas; sometimes entering the mouths of rivers, and feeding like its congeners on the smaller fishes, insects, &c. Its ova are hatched internally, and the young acquire their perfect form before the time of their birth. Not less than two or even three hundred of these have been sometimes observed in a single fish. When the latter is advanced in its pregnancy, it is scarcely possible to touch the abdomen without causing the immediate exclusion of some of the young, which are immediately capable of swimming with great vivacity. It probably breeds more than once in the course of the year; at least naturalists have assigned different seasons to the production of its young. Its flesh is white and fat; but a prejudice has been entertained against it, because the bones, like those of the gar-fish, become green by boiling. According to the observation of Linnæus, they are also phosphorescent in the dark.

Impenus. *Areolated blenny.*—Yellowish, with subcylindric body, marked on the back by brown patches. Inhabits the deep sandy shores of the Mediterranean, and conceals itself among fuci, stones, &c. Sometimes grows to 10 or 12 inches.

Amimus. *Frog blenny.*—Brown, with obscurely six-cleft ventral fins, and gular cirrus. Native of the northern seas and of the Swedish lakes; in habit resembling the *gades tau*. Is not eatable, and is said to frighten away other fish.

Muraenoides. *Muraenoid blenny.*—Gill-membrane three-rayed; ventral fins one-rayed, with very minute spines. Body compressed, sword-shaped, smooth, and without visible scales. Described by Swief from a specimen in the Museum of the Peterburgh academy.

Gen. 6. KURTUS.

Body carinated above and below, back elevated, gill-membrane two-rayed.

Indicus. *Indian kurtus.*—Silvery with gold-coloured back. Inhabits the Indian seas. Length, including the tail, about ten inches, and the greatest breadth somewhat more than four inches. Feeds on shell-fish, small crabs, &c.

III. THORACIC.

THE fishes of this order have the ventral fins at the breast, or nearly under the pectoral fins. They are

generally voracious, preying on other fishes; they are mostly inhabitants of the sea; and their skins, with a few exceptions, are furnished with scales. None of them are viviparous.

Thoracic Fishes.

Gen. 1. CÆPOLA.

Cæpola.

Head roundish and compressed; mouth turning up, a single row of curved teeth; gill-membrane six rayed; body sword-shaped and scaleless; the abdomen scarcely so long as the head.

Common band-fish ribband-fish, or tape-fish.—tænia. Caudal fin attenuated, head very obtuse. Very thin, and almost transparent, so that its vertebræ are visible. Grows to the length of four or five feet. It swims with rapidity, and haunts the muddy or weedy shores of the Mediterranean. Scarcely eatable, having little or no flesh.

Rubescens band-fish.—Caudal fin attenuated, jaws *rubescens* pointed. A rare species, and not very distinctly described by authors. It is said to inhabit the Mediterranean.

The other species are *trachyptera* and *hermanniana*.

Gen. 2. GYMNETRUS.

Gymnetrus.

Body very long and compressed; teeth numerous and subulate; gill-membrane four or five-rayed; anal fin wanting.

Ascanian gymnetrus.—Silvery, speckled longitudinally with brown points, and with the ventral cirrhi dilated at the tips. This singular fish, which is but imperfectly described in the *Icones Rerum Naturalium* of Professor Ascanius, is distinguished by the peculiar conformation of its ventral fins, which have more the appearance of long single rays or processes terminated by a small ovate and expanded tip. It is said either to precede or accompany the shoals of herrings in the northern seas, and is popularly denominated *king of the herrings*. That described by Dr Shaw from a drawing and notes in the possession of Dr Russel, is perhaps either a variety or sexual difference of the *ascanian*.

Hawkinian or Blochian gymnetrus.—Bluish, silvery, *harakenis*, with oblique, linear, brown bands, and rounded spots, red fins, and four long ventral processes. Described by Dr Bloch, from a drawing communicated by J. Hawkins, Esq. In general appearance, much allied to the other kinds of gymnetrus; from which, however, it is readily distinguished by its two pair of ventral processes with their finny extremities, and large distant round spots on the body. A native of the Indian seas. A specimen was thrown on the coast of Cornwall in February 1798.

Cepedian gymnetrus.—Described by La Cépède, from *lanceolata* a coloured Chinese drawing, therefore very imperfectly known.

Gen. 3. VANDELLIUS.

Vandellius.

Body very long and sword-shaped; gill membrane five or six-rayed; teeth subulate, and those in front largest.

Lusitanian vandel.—Silvery, with forked tail. Occurs, though very rarely, in the Mediterranean and Atlantic seas. It has been sometimes taken near Lisbon.

Thoracic
Fishes.

bor. Dr Vandelli considers it as nearly related to the genus *trichurus*. There is in the British Museum a dried specimen, which is four feet eight inches in length, the breadth three inches and a half, and the thickness very slight in proportion.

Echeneis.

Gen. 4. ECHENEIS.

Head oily, naked, and depressed, flat above, and emarginated, transversely fulcated, and the sulci serrated; gill-membrane ten-rayed; body scaleless.

remora.

Mediterranean remora, or sucking-fish.—Tail forked; head with eighteen lines or bars. This number, however, is subject to vary, and cannot be safely assumed as a certain character. Grows to the length of about eighteen inches, and is usually of an uniform brown colour. It is remarkable for the apparatus on its head, by which it firmly adheres to rocks, ships, or animals, being incapable of swimming easily to any considerable distance. From this adhesive property arose the marvellous account of the ancients, who alleged that the remora could arrest a ship under full sail in the midst of the ocean. They also pretended, that it completely subdued the passion of love. Five individuals of this species have been found fastened to the body of a single shark. The latter fish, it is said, will not swallow them. The Indians of Cuba and Jamaica formerly kept and fed sucking-fishes for the purposes of catching others. The owner, on a calm morning, would carry one of them out to sea, secured to his canoe by a small but strong line, many fathoms in length; the creature fastened on the first fish in its way. The Indian, meanwhile, loosened and let go the line, which was provided with a buoy to mark the course which the sucking-fish had taken; and he pursued it in his canoe, until he perceived his game to be nearly exhausted. He then gradually drew the line towards the shore, the remora still so indelibly adhering to his prey, as not easily to be removed. Oviedo says, he has known turtle taken by this mode, of a weight that no single man could support. This species inhabits the ocean and the Mediterranean. Its flesh is said to taste like fried artichokes.

neocrates.

Indian remora, or longest sucking-fish. Tail entire; 24 bars on the head. Occurs more frequently in the Indian and American seas than in those of Europe, and is very common about the Mozambique coast, where it is used in catching turtle. It is found of the length of two or three feet, or even of seven. The upper parts of the body are olive green, and the under parts are whitish. Its flesh is tough and meagre.

lineata.

Lineated remora.—Tail wedge-shaped; head with ten bars, two longitudinal white lines on each side of the body. Inhabits the Pacific ocean.

Coryphæna.

Gen. 5. CORYPHÆNA.

Head much sloping and truncated; gill membrane five-rayed; the dorsal fin of the length of the back.

hippurus.

Common coryphæna, or dolphin. Forked tail. Inhabits the Mediterranean, Indian, and Atlantic seas, often appearing in large shoals, playing round ships, and eagerly devouring any articles of food that happen to be thrown overboard. It will even swallow indigestible substances, such as iron nails, &c. Like its

congeners, it exhibits splendid and vivid hues in the water, being of a bright and beautiful blue-green, accompanied by a golden gloss. When taken out of the water, this fine combination of colouring gradually vanishes with the principle of life. Its ordinary length is about three feet; but it is often seen of four, or even five feet in length. It is strong and voracious, pursuing the smaller fishes, and especially persecuting the flying-fish. In spring and autumn it frequents shores, to deposit its spawn. As its flesh is much esteemed, it is taken both with the line and net. Though popularly called dolphin, it is not to be confounded with the *delphinus* of the ancients.

Of the following, which more or less resemble the preceding, the history is too obscure to detain us: *equifetus, plumieri, cærulea, pentodactyla, novacula, chrysurus, pompilus, fasciolata, delifera, psittacus, fœmberoides, acuta, sima, virens, hemiptera, branchiostega, japonica, chryseata, lineata, and sinensis.*

Gen. 6. MACROCERUS.

Macrocerus.

Head and eyes large; body at the hind part attenuated into the tail.

Long-tailed *imminctus*. Two dorsal fins, of which the *rupestris*. first has the first ray toothed at the back. This is the *coryphæna rupestris* of Linnaeus.—It chiefly occurs about the coasts of Greenland and Iceland, where it is regarded as a dainty. The head is large and thick, and the body is covered with rounded scales, each of which is furnished with a toothed carina, ending in a pointed tip, so that the hand is wounded by drawing it over the fish from the tail towards the head. When taken, its body swells, as if with rage, and its eyes project in a hideous manner.

Gen. 7. GOBIUS.

Gobius.

Head small, with two approximated pores between the eyes, one pore placed before the other; gill-membrane four-rayed; body small, compressed on both sides, covered with small scales, and furnished with a pimple behind the vent; the ventral fins coalescing into an oval shape; two dorsal fins.

Common, or black goby, sea gudgeon, or miller's-niger, thumb. Fourteen rays in the second dorsal fin. Grows to the length of six inches. The body is wedge-shaped, soft, and slippery, and overspread with small dusky or blackish specks.—This species is said to affix itself to the rocks by the union of its ventral fins in the form of a funnel, from which circumstance it is sometimes called *rock-fish*. It is a native of the Mediterranean and southern seas, frequenting the shores in the beginning of summer, when it deposits its spawn. It is edible, but not held in particular estimation.

To this numerous genus also belong *bicolor, cruentatus, paganellus, arabicus, nebulosus, electris, aphyæ, minutus, joxo, peclinirostris, schlosseri, melanurus, boddaerti, lagocephalus, cyprinoides, lanceolatus, bosci, cærulens, broussoneti, plumieri, ocellaris, ater, and anguil-laris.*

Gen. 8. GOBIOMORUS.

Gobiomorus.

Habit as in the preceding genus; ventral fins distinct.

Southern gobiomorus. Gobiurus frigateus of Linnaeus. *australis*.
Blue

Thoracic
Fishes. Blue green, with red spots; whitish beneath; head variegated with yellow, and the fins with red.—Native of the southern ocean.

Gen. 10. SCORPENA.

Thoracic
Fishes.

ottus. Gen. 9. COTTUS.

Head broader than the body, and armed with spines; eyes vertical, furnished with a nictitating membrane; gill-membrane six-rayed; body round, without scales, attenuated towards the tail; dorsal fins more than one.

Head large, aculeated, cirrhatcd, obtuse, scaleless, and subcompressed; eyes approximated; teeth in the jaws, palate, and fauces; gill membrane seven-rayed; body fleshy; one dorsal fin, long; the first rays spinous.

ataphrac-
us. Mailed or armed bull-head, or *pozzo*. Covered with a hard crust; two bishd warts on the rostrum; head furnished with cirrhi below. General length about five or six inches. The head large, bony, and rugged; the body octagonal, and covered with a number of strong bony crusts.—Frequents the European seas, and is plentiful on our own coasts, living on worms and water insects, particularly young crabs, and spawning in the month of May. It is dressed for the table, but not esteemed a luxury.

Porcine scorpena, little sea scorpion, or sea devil.—*porcu*. Cirrhi at the eyes and nostrils. Common in the Mediterranean. Seldom exceeds a foot in length. Wounds with the spines of its dorsal fin. Flesh tough, and scarcely eatable.

uadricor-
is. Four horned bull-head, with four bony tubercles on the head.—Native of the Mediterranean, Baltic, and northern seas. Used chiefly as a bait.

Rufous scorpena, or larger sea scorpion.—Two cirrhi on the under lip. Larger than the preceding, being sometimes four feet in length. It preys not only on the smaller fishes, but, occasionally, on marine birds. Inhabits the Atlantic, Mediterranean, and northern seas.

rrenniens. Grunting bull-head. Throat shagged with cirrhi; body naked.—When first taken, it utters, like some of the gurnards, a kind of abrupt grunting sound, by the sudden expulsion of air from the internal cavities, through the gill-covers and mouth. It is reckoned esculent; but the liver is said to be hurtful. Native of the Indian and American seas.

Horrid scorpena.—Scattered over with callous tubercles. Of a very uncouth and forbidding aspect. Measures from 12 to 15 inches in length, and inhabits the Indian seas.

torpius. *Lasfer bull-head*, or *father-lasfer*. Several spines on the head; the upper jaw rather longer than the lower. Inhabits the Mediterranean, and the northern ocean of Europe and America.—It is very strong, swims with great rapidity, and is very voracious, preying on the blennies, cod, herring, salmon, as well as on smaller fishes and insects. It is very frequent in Greenland, where it sometimes attains to the length of six feet, and where it is much relished as an article of food. It is said to be able to live a considerable time out of water, having the power of closing the gill-covers so as to exclude the effects of atmospheric air. Like the grunting bull-head, it utters a strong sound when first taken.

Flying scorpena.—Thirteen rays in the dorsal fin; six cirrhi, the pectoral fins longer than the body. Like fishes of the *exocetus* and *trigla* genus, it uses its pectoral fins for the purposes of occasional flight. Native of the rivers of Japan, Amboyna, &c. where it is reckoned excellent food.

obi. *River bull-head*, or *miller's thumb*. Smooth, with two spines on the head.—Inhabits the clear rivers and brooks of Europe and Siberia, generally lying on the gravel, or concealing itself beneath the stones, preying on worms, water insects, and very young fishes. It deposits its spawn in March or April. In this country its length seldom exceeds three inches and a half; but in other parts of Europe it seems to arrive at a superior size, and is even found of the length of seven inches. It is of a yellow olive colour, has a large head, slippery skin, and tapers to the tail. It is most readily caught during the night, and its flesh, which grows red by boiling, is esteemed good and wholesome.

Besides the preceding, naturalists reckon *plumieri*, *commerstonii*, *bicapillata*, *brachiata*, *aculeata*, *barbata*, *antennata*, *capensis*, *spinosa*, and *americana*.

Gen. 11. ZEUS.

Zeus.

Head compressed, and sloping; upper lip arched with a transverse membrane; tongue subulated; gill membrane with seven perpendicular rays, the lowest transverse; body compressed, thin, and shining, the rays of the first dorsal fin ending in filaments.

Infidious dory.—With a narrow mouth. Native of the rivers and fresh waters of India.

Brazilian dory.—The second ray of the dorsal and anal fin very long. Of a rhomboidal shape, about six or eight inches long, very thin, and scaleless. Native of the American seas, and sometimes seen in those of the north of Europe. Edible, but not much in request.

Infidious dory.—With a narrow mouth. Native of the rivers and fresh waters of India.

Indian dory.—The tenth ray of the dorsal and the second of the anal fin longer than the body. Native of the American and Indian seas.

Ciliatea dory.—With some of the rays in the dorsal and anal fin very long. Native of the Indian seas.

Common dory.—The tail rounded; a brown central spot on each side of the body; two anal fins. Grows to nearly 18 inches in length, and weighs from 10 to 12 pounds. The head is abrupt, the mouth wide, the back much arched, and furnished with a row of strong small prickles. The body is covered with very minute scales, dusky brown above, and of a shining greenish yellow on the sides. 'We are indebted (says Mr Pennant) to that judicious actor and *bon vivant*, the late Mr Quin, for adding a most delicious fish to our table, who overcoming all the vulgar prejudices on account of its deformity, has effectually established its reputation.'

Theriac
Fishes.

The dory is extremely voracious, and, when first taken, makes the same kind of sound, as the gurnards and scorpenas. It is a native of the Mediterranean, Atlantic, and northern seas. It is fished on the southern coasts of England; but the largest are found in the bay of Biscay.

aper.

Red dory.—Tail even; body reddish. Resembles the preceding, but is much smaller. Native of the Mediterranean.

opah.

Opah dory.—Tail somewhat lunated; body reddish, with white spots. This beautiful species measures from four to five feet in length; the general colour sometimes a brilliant silvery green, and sometimes a bright gold colour, variegated with pretty numerous, and moderately large, oval white spots; while the fins and tail are bright scarlet. It is the *scus luna* of Linnæus. Found, though rarely, in the Mediterranean and northern seas.

quadratus.

Square dory.—Tail even; body cinereous, with transverse dusky bars. Native of the coasts of Jamaica.

Pleuronectes.

Gen. 12. PLEURONECTES.

Head small; eyes spherical, both on the same side of the head, and near each other; mouth arched; jaws with teeth, and unequal; gill-membrane, with four to seven rays; the gill-cover, in most of the species, consisting of three plates; body compressed, carinated; the one side somewhat convex, answering to the back; the other, of a paler colour, to the belly; the vent nearer the head than the tail.

The fishes of this genus are remarkable for having both eyes on one side of the head; and they are divided, into two sections, according as they have the eyes towards the right, when the animal is laid with its coloured side upwards, with its abdomen towards the spectator; or to the left, when the fish is in the same situation.

* With eyes towards the right.

hippoglossus.

Holibut.—The whole body smooth. Dusky above, pure white beneath. Narrow in respect to its length. Individuals have been taken on the English coast, which weighed from 200 to 300 pounds; and the Icelanders have caught some which weighed 400 pounds. Olafsen mentions, that he saw one which measured five ells; and we are told by the Norwegian fishermen, that a single holibut will sometimes cover a whole skiff. This species, then, is more entitled to the epithet *maximus*, than that to which it is applied. Though it inhabits the Mediterranean, it arrives at a larger size in the northern seas of Europe and America. It is so voracious, that it devours rays, crabs, haddocks, and even lump-fish, of which it seems to be very fond. The part of the body nearest the fins, is fat and delicate, but surfeiting; the rest of the fish is regarded as coarse food. The Greenlanders cut it into thin slips, and dry them in the sun. This fish deposits its spawn in spring, among rocks near the shore.

agnoglossus.

Smaller holibut.—Body smooth, oblong; teeth obtuse; tail roundish. Very like the preceding, but smaller, and more relished as an article of food. Native of the northern seas.

platessa.

Plaife.—Body smooth, with six tubercles on the head. Readily distinguished by its very broad and flat

shape, its pale brown colour above, and the orange-coloured spots with which it is marked. One of eight or nine pounds is reckoned a large fish, though instances occur of their weighing 15 pounds. They spawn in the beginning of May, and are common in the Baltic and northern seas. The best are said to be taken off Rye, on the Sussex coast, and near Holland. They are in considerable request in the fish-market, though far inferior to the sole and turbot.

Theriac
Fishes.

Flounder.—With a rough lateral line, and a series of *sclerites* spines at the base of the fins. Easily distinguished from the rest of the genus by the specific character; and very generally known, as it inhabits every part of the British sea, and even frequents our rivers at a considerable distance from salt water. It likewise occurs in the northern, Baltic, and Mediterranean seas. In size, it is much inferior to the plaife; but it affords a light and wholesome food.

Dab.—Scales ciliated; small spines at the origin of *limanda*, the dorsal and anal fins; teeth obtuse. Of a very broad, ovate shape, yellowish brown above, and white beneath. Inhabits the same seas as the plaife and flounder; but is less common, of a smaller size, and more prized as an article of food.

Smear dab, or *kit*.—Yellowish brown, with smooth *lævis* scales; five dusky spots, white beneath. Caught on the Cornish coast.

Long dab.—Body oblong and rough, lateral line *limando* straight and broad. Much longer than the dab. Inhabits the northern seas, and is esteemed at table.

Rose-coloured flounder.—Colour of a delicate rose; *roseus*, and general proportions those of a flounder. Taken in the Thames, and preserved in the Leverian museum.

Sole.—Body oblong and rough; upper jaw longest. *solea*. More narrow and oblong than any other of the genus. Sometimes grows to the length of more than two feet, and to the weight of eight pounds. Its general size, however, is much smaller. Those of moderate size are generally in most request for the table; and, next to the turbot, are reckoned the most delicate of the genus. The sole is an inhabitant of the northern, Baltic, Mediterranean, and American seas. On the west coast of Great Britain it attains to a much larger size than on the east. The principal sole-fishery is at Brixham, in Torbay.

Smooth sole.—White, transparent, with small, thin, *diaphanus* deciduous scales. Found about the coasts of Cornwall, where it is called *lantern-fish*.

** With eyes towards the left.

Whiff.—Body broad and rough. Native of the *punctatus*, northern sea.

Pearl.—Body smooth; pale brown above, marked *rhombus*, by scattered yellowish, or rufous spots, and white beneath. Resembles the turbot, but is inferior in size. Native of the European seas.

Turbot, or *bret*; *pleuronectes maximus* of Linnæus.—*tubercula*. Body rough. This fish, which is reckoned such delicate eating, is found both in the Mediterranean and northern seas. It is broader and squarer than any of the genus, except the pearl, and is of a dark brown above, marbled with blackish spots of different sizes, and white beneath. Like the rest of this genus, the turbot generally lies in deep water, preying on worms, shell-fish, small fishes, &c. It is taken in great quantities

Thoracic
Fishes.

ties about the northern coasts of England, as well as on those of France, Holland, &c. They are so extremely delicate in their choice of baits as not to touch a piece of herring, or haddock that has been 12 hours out of the sea. Though the turbot and holibut are often confounded in our markets, the former may be easily recognised by the large, unequal, and obtuse tubercles on its upper part.

In this numerous genus are also classed *trichodactylus*, *zebra*, *plagiata*, *ocellatus*, *rondeletii*, *linguata*, *glacialis*, *platessoides*, *argenteus*, *barbatus*, *marmoratus*, *pavoninus*, *lineatus*, *bilineatus*, *ornatus*, *dentatus*, *macrolepidotus*, *passer*, *papillofus*, *argus*, *stellatus*, and *japonicus*.

Chætodon.

Gen. 13. CHÆTODON.

Head small; mouth narrow, with retractile lips; teeth generally setaceous, flexible, moveable, equal, very numerous, and close; eyes round, small, vertical, and furnished with a nictitating membrane; gill-membrane from three to six-rayed; body broad, thin, compressed, covered with hard scales, and coloured; dorsal and anal fins rigid, fleshy, scaly, and generally terminated with prickles.

To avoid much unnecessary repetition, we shall observe, in general, that upwards of 60 species of chætodons have been distinctly ascertained; that they are mostly natives of the American and Indian seas; that they are distinguished by the great depth and highly compressed form of the body, which is often beautifully variegated by transverse, oblique, or longitudinal bands, and covered with strong scales, finely denticulated on the margins; and that the dorsal and anal fin are remarkably broad, and, in many species, of an unusual length.

One of the most remarkable species of this genus is the *rostratus*, *rostrated* or *beaked chætodon*, with an entire tail, nine spines in the dorsal fin, an ocellated spot on the sides, and the beak cylindrical. It is of a roundish-ovate shape, about six or eight inches in length, of a whitish colour, with a dusky tinge on the back, and marked by fine transverse and nearly equidistant brown bands, with milk-white edges. It is a native of the fresh waters of India, and feeds principally on flies and other small winged insects which hover about the surface of its native waters. When it sees a fly at a distance, alighted on any of the plants in the shallow water, it approaches very slowly, and with the utmost caution, coming as much as possible perpendicularly under the object. Then putting its body in an oblique direction, with the mouth and eyes near the surface, it remains a moment immovable. Having fixed its eyes directly on the insect, it darts at it a drop of water from its tubular snout, but without shewing its mouth above the surface, from which only the drop seems to rise, and that with such effect, that, though at the distance of four, five, or six feet, it very seldom fails to bring its prey into the water. With the closest attention the mouth could never be discovered above the surface, although the fish has been seen to spout several drops successively, without leaving the place, or in the smallest apparent degree moving its body. This very singular mode of attacking its prey was reported to M. Home, governor of the hospital at Batavia, and so far excited his curiosity, that he ordered a large tub

to be filled with sea-water, and had some of the fishes caught and put into it. When they were reconciled to their confinement, he caused a slender stick, with a fly fastened at the end, to be placed in such a manner on the side of the vessel, as to enable the fish to strike it; and it was not without inexpressible delight, that he daily saw them exercising their skill in shooting at it, with amazing force, and seldom missing their mark. This faculty is possessed by a few other species belonging to very different genera. The flesh of the rostrated chætodon is white and well-tasted.

Angel chætodon, or *angel-fish* of Catesby, is of a fine gold-green colour, with the scales covered by smaller ones. The pectoral, ventral fins, and tail, are of a vivid orange; and the dorsal and anal, violet-blue at the base, and bright crimson towards the tips.—It is common off Carolina and the Bahama isles, where it is much esteemed for its delicacy.

Imperial chætodon, is a magnificent species, growing to the length of a foot or more. Its ground colour is a golden-yellow, which is longitudinally, though somewhat obliquely, striped with very numerous bright blue parallel rays. It is a native of Japan, and said to be superior to the salmon in flavour.

Sea bat, or *bat chætodon*, surpasses all the other species in the great extent and breadth of the dorsal and anal fin, both which nearly equal the body itself in size, and are of a somewhat triangular shape.—It is a native of Japan.

Red-striped chætodon, is distinguished by numerous red stripes on the body, and an eye-shaped spot and brill on the dorsal fin.

Three-coloured chætodon, is golden-yellow on the fore-part, jet black behind, except the tail, which is yellow, and red near the end, while the edges of the gill-covers, and of all the fins, are bright red.

Gen. 14. ACANTHURUS.

Acanthurus

Teeth small, and in most species lobated; tail aculeated on each side. This genus comprises such species of the Linnæan *chætodon* as, in contradiction to the principal character of that genus, have moderately broad and strong teeth, rather than slender and setaceous ones.

Unicorn acanthurus. Gray-brown; with a frontal horn projecting over the snout, and two spines on each side of the tail. Of the length of three feet or upwards. Its horn-shaped process is strong and conical, terminating rather obtusely.—It is a native of the Indian and Arabian seas, in the latter of which it is usually seen in shoals of two or four hundred, swimming with great strength, and feeding principally on the different kinds of sea-weed. It is singular that so remarkable a fish should have been entirely overlooked by Linnæus, even in the twelfth edition of the *Systema Nature*.

The other species are denominated *nasus*, *teuthis*, *nigricans*, *militaris*, *tristegus*, *harpurus*, *schal*, *nigrofasciatus*, *achilles*, *lineatus*, *vibratus*, *melagris*, and *velifer*.

Gen. 15. EQUUS.

Equus.

Teeth in several rows; body banded.

American knight-fish. *Chætodon lanceolatus*, Lin. *americanus*. Body oblong; yellowish, with three black bands, the

Thoracic Fishes. first across the eyes, the second across the thorax, and the third along the body. Native of the American seas.

Trichopus.

Gen. 16. TRICHOPIUS.

Body compressed; ventral fins, with a very long filament.

goramy.

Goramy trichopus. Rufescent, with a silvery cast on the sides; and the second ray of the ventral fins extremely long. Native of the fresh waters of China, where it is much prized as an article of food.

arabicus.

Arabian trichopus. *Labrus galus*, Lin. Greenish, with violet and blue stripes, and second ray of the ventral fins very long. Native of the Arabian seas.

satyrus.

Satyr trichopus. With sinking forehead, projecting chin, and extremely long, single rayed, ventral fins. Native of the Indian seas.

pallasii.

Pallasian trichopus. *Labrus trichopterus*, Lin. Brown, with pale undulations, a black spot on each side of the body and tail, and long single-rayed ventral fins. Native of the Indian seas.

monodactylus.

Morodafile trichopus. Silvery, with brownish back, and short, single-rayed, rigid ventral fins. Native of the Indian seas.

Sparus.

Gen. 17. SPARUS.

Strong cutting or canine teeth, with obtuse and clove-set grinders; lips double; gill membrane five-rayed, gill covers scaly; body compressed, lateral line curved behind; pectoral fins rounded.

Of this very extensive genus, most of the species are exotic; and their history is very imperfectly known. Considerable confusion takes place with respect to the characters by which they ought to be discriminated from the *labri*, a family to which they are much allied. We shall briefly notice only a few of the most striking and best known species.

amata.

Gilt-head, has a lunulated spot between the eyes. A more permanent character may be assumed from the six cutting teeth in each jaw. This species is about 15 inches long, but sometimes of a much larger size. It is of a silvery bluish cast, with gold-coloured brown, and sometimes with several brownish longitudinal stripes. The body is broad and thin, and the back elevated. The gilt-head is a native of the Mediterranean, Atlantic, and Indian seas; frequenting deep water on bold rocky shores; and living chiefly on testaceous animals. It is said to sleep at stated times, and to be very susceptible of cold. The Greeks and Romans reckoned it a most delicate morsel, and the former held it to be consecrated to Venus.

erythrinus.

Rose sparus, is remarkable for its beautiful rose-red colour. In size and shape, it resembles the perch. It is a native of the Mediterranean and Indian seas, in the latter of which it is said to acquire noxious qualities.

fasciatus.

Fasciated sparus, is of a squarish elongated shape; with transverse dusky bands, and the fins edged with black. It is a native of Japan.

chlorourus.

Green-tailed sparus, is a native of the American seas, and a highly elegant species; having its yellowish and large scales crossed by a green band, green fins, and rose-coloured gill-covers. The green tail is strongly lunulated, and marked by minute pale specks.

A striking disposition of colours likewise distinguishes, the *chrysurus*, or *gold tailed sparus*, which is found in the seas of South America. Its general complexion is a bright rose-red, which is deepest on the back; a gold yellow stripe runs on each side from the gills to the tail, and a second on each side of the bottom of the abdomen.

Spined sparus, has the dorsal spines recumbent, and the five in the middle filiform, and elongated. It is of a reddish silvery hue, with the back and the lines on the body dusky; shape ovate; and length, a foot and a half. It inhabits the Red sea; and is reckoned a delicious fish for the table.

Squirrel sparus, *squirrel-fish*, or *grunt*.—Gray-brown, *sciurus*, with large scales bordered with yellow, and head marked longitudinally by numerous blue and yellow lines. According to Bloch, the blue lines also run along the body. Native of the American seas. It is the *perca formosa* of Linnæus.

Insidious sparus.—Red, yellowish on the sides; tail *insidiator*, sub-forcipated. Length about ten inches. Native of the Indian seas, where, through its long tubular snout, it floats a drop of water at the insects on which it feeds, in the same manner as the rostrated chætodon.

Galilean sparus.—Greenish, with whitish abdomen. *galileus*. Very common in the lake of Genesareth, and therefore supposed to have been the principal species in the miraculous draught of fishes recorded by St Luke.

Desfontaine's sparus.—With 23 rays in the dorsal fin, 11 in the anal, and a black spot on the gill-covers. *desfontainei*. Inhabits the warm waters of Cassa in Tunis, which, in January, are about 30 degrees of Reaumur's thermometer above the freezing point; but it is also found in the cold and brackish waters surrounding the date plantations at Tozzar.

Argus sparus.—Of a silvery blue; with many ocellated brown spots. A very elegant species, of which the native country is uncertain. *argus*.

Climbing sparus.—Olive-green, with yellowish abdomen, and gold-coloured eyes. Length about a span; skin covered by a blackish mucus. "This fish (says Dr Shaw) is remarkable for its power of climbing, which it performs by the assistance of the spines of its gill-covers, moving itself at pleasure up the stems of trees growing near the waters it frequents. In this situation it was observed in the month of November 1791, at Tranquebar, by Lieutenant Daldorff, who communicated its description to Sir Joseph Banks. It was seen ascending a fissure in the stem of the palm called *Sorafusus stabellifer*, growing near a pool of water, and was observed to move itself forwards by alternately applying the spiny sides of the gill-covers to the sides of the fissure, assisting itself at the same time by the spines on each side of the tail, and had already ascended to the height of more than five feet above the water when it was first observed: it was found to be very tenacious of life, moving about on dry sand, many hours after it was taken."

Gen. 18. SCARUS.

S. arus.

Instead of teeth, the jaws are eminent, crenated, and bony, with a toothed margin; gill-membrane five-rayed, gill-cover entire, lateral line generally branched.

Cretan

Cretan scarus.—Green, yellowish beneath, with very large scales, ramified lateral line, and sublimated tail. Native of the Mediterranean and Indian seas. Common about Crete.

Green scarus.—Yellowish-green; with large scales, edged with green; lateral line interrupted towards the tail. Native of the Japanese seas.

Rivulatus scarus.—Bluish, spotted with black, and marked by longitudinal yellow undulations. Native of the Red sea.

Stellated scarus.—Oval, blackish; variegated with subhexagonal pale rings. Native of the Arabian seas.

Red scarus.—Rose-red, with silvery abdomen. Native of the Indian seas.

Parrot scarus.—Greenish, marked with yellowish lines, and with the edges of the fins, abdominal band, and variegations of the head, blue. Native of the Arabian seas.

Purpled scarus.—Dull-green, with three longitudinal ferrated purple bands on each side, and blue abdomen. Native of the Arabian seas.

Black scarus.—Ovate-oblong; blackish-brown, with red lips, and the margin of the fins greenish-blue. Native of the Arabian seas.

Blue-striped scarus.—Whitish, with the scales marked by transverse bluish bands, and double lateral line. Native of the Arabian seas.

Ferruginous scarus.—Brown-ferruginous, with the jaws and margins of the fins green, and tail even. Native of the Arabian seas.

Sordid scarus.—Brown-ferruginous, with darker-coloured fins, and rising, even-tail. Native of the Arabian seas.

Scaly-tailed scarus.—Tail-forked, the middle of its back beset with scales. Native of the Arabian seas.

Schlosserian scarus.—Gold-coloured, with five dusky spots on each side, brownish back, and nearly even tail. Native of Java.

Gen. 19. GOMPHOSUS.

Jaws lengthened into a tubular snout; teeth small, those in the front larger.—This genus, instituted by La Cépède, contains two species, both natives of the Indian seas, and both agreeing in the remarkable form of the mouth, which consists of a tubular process, somewhat truncated at the tip.

Blue gomphosus.—Entirely blue. About the size of a tench.

Variogated gomphosus.—Variogated with red, yellow, and blue. Smaller than the preceding.

Gen. 20. LABRUS.

Teeth acute; lips not doubled; gill-membrane six-rayed; gill-covers scaly; the rays of the dorsal fin furnished behind with a filiform process; the pectoral fins acuminate; and lateral line straight.

From this very numerous genus, the discrimination of which has never been accomplished with accuracy, we can afford to select only a few species.

Ceylonse labrus, or *Ceylon wrasse*.—Green, purplish beneath, with blue head, and gill-covers variegated with

purple. This beautiful fish is a native of Ceylon, where it is reckoned edible.

Jaculator, or *shooting labrus*.—Gray, clouded with yellow; five transverse dusky bands; and lower jaw longer than the upper. Darts water on its prey, like the rostrated chaetodon and insidious sparus. Native of the Indian seas.

Scare labrus.—Whitish, mixed with red; with transverse appendages on each side of the tail. Native of the Mediterranean; where it feeds principally on fuci, and swims in shoals. It was in high esteem with the ancients as a food, and considered by the Romans as one of the principal delicacies of the table.

Ballan labrus, or *ballan wrasse*.—Yellow, with fulvous spots, reflex lips, and ramentose dorsal fin. Weighs about five pounds. Appears annually in great shoals off Filey-bridge, near Scarborough.

Ancient labrus, *ancient wrasse*, or *old wife*.—Beak bent upwards; end of the tail circular. Size and habit of a tench. Native of the European seas, and usually found in deep waters, about rocky coasts. Liable to vary much in colour.

Parakeet labrus.—Green, with three longitudinal red stripes on each side, and yellow dorsal fin marked by a longitudinal red band. A beautiful species, which inhabits the American seas.

Beautiful labrus.—Red, with longitudinal, interrupt-ed, flexuous, blue streaks; and fins edged with blue.

Jurella labrus.—Sides bluish, both marked by a longitudinal, fulvous, and dentated band. Length about eight inches, and form somewhat lengthened. Occurs in shoals in the Mediterranean. The more ancient ichthyologists erroneously considered it as poisonous, and as the most beautiful of the finny tribes.

Gen. 21. OPHICEPHALUS.

Head coated with dissimilar scales; body elongated.

Punctated ophicephalus.—Dusky, paler beneath, the head pierced by pores, and the body speckled with black points. Length about ten inches. Frequents rivers and lakes in India; and is reckoned a delicate and wholesome food.

Striated ophicephalus.—Dusky, with the abdomen and fins striated with dusky and whitish variegations. Length about twelve inches. Native of India; inhabiting lakes, and equally esteemed with the former as food.

Gen. 22. LONCHURUS.

Head scaly; ventral fins separate; tail lanceolate.

Bearded lonchurus.—Ferruginous-brown; with slightly lengthened nose; two beards at the lower jaw; and the first ray of the ventral fins elongated into a bristle. Length about twelve inches. Native of Surinam.

Gen. 23. SCIÆNA.

The whole head covered with scales; gill-membrane six-rayed; a furrow on the back, in which the dorsal fin is seated.

Most of the species of this genus are exotic, and but obscurely known.

Thoracic
Fishes.
cirrrofa.

Cirrrofa or *bearded sciaena*, has the upper jaw longer than the lower, and a beard on the latter. It has the habit of a carp, and measures from one to two feet. Native of the Mediterranean. Was valued by the Greeks and Romans as an article of food.

labrax.

Basse sciaena, or *basse*. *Perca labrax* of Lin.—Sub-argenteous, with brown back, yellowish-red fins, and dusky tail. Habit of a salmon. Native of the Mediterranean and northern seas; frequently entering rivers. Known to the ancients by the names of *labrax* and *lirpus*, and greatly prized, particularly by the Romans.

Perca.

Gen. 24. PERCA.

Jaws unequal, armed with sharp-pointed and incurved teeth; gill-covers consisting of three plates, of which the uppermost is serrated; gill-membrane seven-rayed, the lateral line following the arch of the back; the scales hard and rough; fins spiny; and vent nearer the tail than the head.

fluviatilis.

Common perch. The second dorsal fin with 16 rays, of a brown olive, sometimes accompanied by a slight gilded tinge on the sides, and commonly marked by five or six broad, blackish, transverse bars. This well known fish usually measures from ten inches to two feet, and weighs from two to four pounds, though some have weighed eight, nine, or ten pounds. The perch inhabits clear rivers and lakes in most parts of Europe, haunts deep holes in gently flowing rivers, spawns early in spring, is of a gregarious disposition, very voracious, and so tenacious of life, that it may be carried to the distance of 60 miles in dry straw, and yet survive the journey. It feeds on aquatic insects and the smaller fishes, and is preyed on by the pike, eel, &c. Its flesh is firm and delicate, and was held in repute at the table of the ancient Romans. In some of the northern countries a sort of isinglass is prepared from the skin.

lucio-perca.

Sandre perch.—The second dorsal fin with 23 rays; of a larger size, and more like a pike than the preceding. Native of clear rivers and lakes in the middle parts of Europe.

cernua.

Ruffe perch, or *ruffe*.—Dorsal fin with 27 rays, of which 15 are spiny. Length from six to eight inches, and shape more slender than that of the common perch. Feeds on worms, insects, and young fishes, and is frequently preyed on by the pike, larger fishes, and aquatic fowls. Spawns in March and April; inhabits clear rivers in many parts of Europe, especially towards the north; and affords excellent food.

puffilla.

Small perch. Body ovate, compressed, rough. Scarcely exceeding the length of an inch and a half. Native of the Mediterranean.

marina.

Sea perch.—The dorsal fin with 15 spiny rays, and 14 soft ones; the body variegated with dusky lines. Colour red, marked with dusky transverse lines on the sides. Inhabits the Northern, Mediterranean, and Atlantic seas, and is in high esteem for the table.

Holocentrus.

25. HOLOCENTRUS.

Habit of the genus *perca*; gill-covers scaly, serrated, and aculeated; scales in most species, hard and rough.

sogo.

Sogo holocentrus.—Silvery red, with longitudinal yellow lines on each side. A highly beautiful species,

about a foot in length. Native of the Mediterranean, Indian and American seas, and considered as an excellent fish for the table.

Thoracic
Fishes.

Spur-gilled holocentrus.—Subargenteous, with brownish back, large scales, and spurred gill-covers. Native of Japan.

Surinam holocentrus.—Brownish; with yellowish clouds, red head, and anterior gill covers ciliated with spines. Native of Surinam, where it is reckoned one of the best fishes which the country produces.

26. BODIANUS.

Bodianus.

Habit of the genus *perca*; gill-covers scaly, serrated and aculeated; scales in most species smooth.

Purple-backed bodian.—Gold yellow, with purple back. Shape like that of a trout; length about 14 inches. Native of the South American seas.

Five-spined bodian.—Rose-coloured, with silvery abdomen, and dorsal fin yellow on the fore part. Native of the Brazilian seas. Accounted good food.

Aya bodian.—Red, with silvery abdomen, single-spined gill-covers, and lunated tail. This highly beautiful species is said to grow to the length of three feet. It is found in the Brazilian seas, and regarded as a delicacy.

Large scaled bodian.—Gray brown, with large rounded scales denticulated at the edges. Length about a foot. Native of the East Indies.

Spotted bodian.—Olivaceous yellow, with blue spots and reddish fins. Native of Japan.

Louti bodian. Oblong lanceolate, with smallish lanceous spots, and fins edged with yellow. Native of the Arabian seas.

Palpebral bodian.—Somewhat ferruginous, with ochre-coloured eyes, protected by a moveable yellow valve. Shape nearly that of a perch. Native of the seas about Amboyna.

Silvery bodian.—Silvery, with bluish back. Native of the Mediterranean.

Apua bodian.—Red, with the back spotted, the body speckled, and the fins edged with black. Native of the Brazilian seas.

Guttated bodian, jew-fish, or jacob iversten.—Yellowish brown, with body and fins marked by small ocellated deep brown spots. Native of the Indian and American seas. Esteemed as an edible fish.

Zebra bodian.—Yellowish, with the body marked by transverse, and the head by longitudinal, brown bands. Native of Japan.

Rogaa bodian.—Blackish rufescent, with black fins. Native of the Arabian seas.

Lunated bodian.—Blackish ferruginous, with black lunulated fins, whitish transparent towards the back part. Native of the Arabian seas.

Black and white bodian.—Silvery, with irregular transverse, black bands. Native of the Indian seas.

Star-eyed bodian.—Silvery, with yellowish back, and orbits spiny beneath. Native of the seas about the Cape of Good Hope.

Gen. 27. GASTEROSTEUS.

Gasterosteus.

Head oblong and smooth, the jaws armed with small teeth; tongue short and obtuse; palate smooth; eyes moderately sized, scarcely prominent, lateral; gill-membrane

Thoracic Fishes. membrane six or seven-rayed; gill-cover consisting of two plates, rounded and striated; body at the head rounded at both sides, and covered with shields, and prickles before the dorsal fin; the back and lateral line parallel and straight; the ventral fins behind the pectoral, but above the sternum.

Common stickleback, bassstickle, spearling, &c. with three spines on the back. Length two inches, or three at molt. In the early part of summer, the gills and abdomen are of a bright red, the back a fine olive green, and the sides silvery. Lives only two or three years, is very active and very voracious, devouring the young and spawn of other fishes, worms, insects, and their larvæ. The stronger inhabitants of the waters shun it on account of its spines; but it is infested by intestinal worms. In April and May it deposits its spawn in small quantities on aquatic plants, especially on the white and yellow water lily. It occurs very commonly in ponds, rivers, and marshes, and in some parts, as about Dantzic and the fens of Lincolnshire in extreme profusion. At Spalding, according to Mr Pennant, they appear in the Welland once in seven or eight years in such amazing shoals that they are used as manure, and a man has got for a considerable time four shillings a day by selling them at the rate of a halfpenny per bushel.

altatrix. Skipping stickleback.—Eight dorsal spines connected by a membrane. Native of the seas about Carolina, where it is often observed skipping out of the water.

ungiticus. Smaller or ten-spined stickleback.—Ten dorsal spines. The number of spines is sometimes only nine, and sometimes, though rarely, eleven. This is smaller than the common species, seldom exceeding an inch and three quarters. It is found both in seas and lakes, and enters the mouths of rivers in spring.

pinaculia. Fifteen-spined stickleback. Fifteen dorsal spines. From five to seven inches long, of a slender form, with the head produced, and somewhat tubular. Frequents shallow places in the European seas, and preys on marine insects, and the spawn and fry of other fishes.

pinarella. Minute stickleback.—Four serrulated spines at the hind part of the head; the lateral ones as long as the abdomen. Native of India.

To the same genus belong japonicus, carolinus, canadus.

Gen. 28. SCOMBER.

Head compressed and smooth; gill-membrane seven-rayed; body smooth, the lateral line carinated behind, often spurious fins towards the tail.

* Spurious finlets distinct.

Common mackerel.—With five finlets. Its ordinary length is from 12 to 16 inches, though it has sometimes been found of a much greater size. Its elegant shape and the beauty of its colouring are too well known to require particular description, and its qualities as an edible fish have been long duly appreciated. It dies very soon after it is taken out of the water, exhibits for a short time a phosphoric light, and partly loses the brilliancy of its hues. It is very voracious, and makes great havoc among the shoals of herrings. It dwells in the European and American seas, chiefly affecting the regions within the Arctic circle, and appearing at

stated seasons about particular ranges of coast. Its alleged migrations, like those of the herring, begin to be questioned by some acute observers, and it is more probable that it resides at the bottom of the waters during winter at no great distance from the places where it visibly abounds in summer. A film grows over its eye in winter, when it probably conceals itself in muddy bottoms, and becomes torpid. It is very prolific, and deposits its spawn among the rocks about the mouth of June. The tenderness of its flesh renders it unfit for carriage in a fresh state; but in Cornwall, and several parts of the continent, it is preserved by salting and pickling. Caviar is prepared from the roes on the coasts of the Mediterranean; and the celebrated garum of the Romans is said to have been a condiment prepared from this fish.

Colly mackerel.—Bright green and azure. Somewhat smaller than the preceding, which it very much resembles. Found on the coasts of Sardinia.

Bonito mackerel.—Seven inferior finlets; body marked on each side by four black lines. Resembles the tunny, but is more slender. Frequents the Atlantic and tropical seas, persecuting flying fishes and other species, and tormented in turn by internal worms.

Tunny.—Eight finlets above and below. Usual length about two feet, but sometimes grows to eight, or even ten. The upper part of the body is of a dusky blue, and the abdomen silvery. The tunny is gregarious, and inhabits the Mediterranean, Northern, Indian, and American seas, preying with fierceness on all kinds of smaller fish, and persecuting the mackerel and flying fish. The Greeks and Romans admired its flesh, though rather coarse, and established their tunny-fisheries on various parts of the Mediterranean coast, where this species is still taken in great quantities. The smaller fishes are chiefly sold fresh, and the larger cut in pieces and salted.

** Spurious finlets connate.

Scad or Horse mackerel.—Dorsal fin recumbent, lateral line marked. Length from 12 to 18 inches. Native of the European seas, and nearly equal to the common kind in point of flavour.

We forbear to enumerate several other species which have been recently defined, but whose history is still very incomplete, and shall terminate this abridged account of the genus by the

Pilot mackerel, or pilot fish; gasterosteus ductor of auctor. Linnaeus. Silvery blueish, with four transverse blue bands; four dorsal spines, and tail barred with black. Length about 18 inches; general shape that of the tunny, but the head much shorter. Inhabits the American and Indian seas, and has its name from often swimming near or before sharks, which, it is said, it guides to its prey.

Gen. 29. CENTROGASTER.

Centrogaster.

Head compressed, smooth; gill-membrane generally seven-rayed; body depressed and smooth; fins spiny; ventral fins united by a membrane, which is furnished with four acute spines and six soft rays.

Brownish centrogaster.—Brownish, whitish beneath; tail somewhat forked. Native of the Japanese seas.

Silvery

Thoracic File. *Silvery centrogaster*.—Silvery, with a large brown spot on the nape, and a blackish one on the dorsal fin. Native of the Japanese seas.
argenta-tus. *Saddled centrogaster*.—Finlets and dorsal fin connate. Native of the Arabian seas.
equalis. *Rhombic centrogaster*.—Ventral fins one-rayed. Native of the Red sea.
rhombus.

Mullus.

Gen. 30. MULLUS.

Head compressed, sloping, covered with scales; eyes oblong, approximated, and vertical, with a nictitating membrane; nostrils small and double; jaws and palate rough, with very small teeth; tongue short, narrow, smooth and motionless; gill-membrane three-rayed; gill covers consisting of three finely striated plates; the aperture moderate; body round, elongated, red, with large and deciduous scales.

barbatus. *Red surmullet*.—Two cirrhi; the body red. Length from 12 to 15 inches; colour a fine rose-red, with an olive tinge on the back, and a silvery hue towards the abdomen. It is found in the Mediterranean and northern seas, is very strong and active, and feeds principally on smaller fishes, worms, and insects. The Roman epicures expended large sums in purchasing this fish for their tables; contemplated, with inhuman pleasure, the changes of its colours, during its slow expiration; and feasted on it with delight, when it was dressed with rare and costly sauces.

surmulletus. *Striped surmullet*.—Two cirrhi, and light-yellow longitudinal lines. Nearly resembling the preceding, and equally delicate as a food. Inhabits the Mediterranean, and is sometimes found in the Atlantic.

The other species are *japonicus*, *auriflamma*, *indicus*, *bandi*, *vittatus*, *trifasciatus*, *bifasciatus*, *maculatus*, *aureovittatus*, and *imberbis*.

Trigla.

Gen. 31. TRIGLA.

Head large, mailed, with rough lines; eyes large, round, and placed near the top of the head; gape wide, palate and jaws set with acute teeth; nostrils double; gill-aperture large; cover consisting of one radiated aculeated plate; gill-membrane seven-rayed; body covered with small scales; back straight, with a longitudinal furrow, spiny on both sides; lateral line near the back, straight, belly thick; ventral and pectoral fins large; at each of the latter free and articulated finger-shaped processes.

cataphracta. *Mailed gurnard*.—Double fingers, snout forked, and elongated; body mailed; length about 12 inches. Native of the Mediterranean.

lyra. *Piper gurnard*.—Triple fingers; nostrils tubular; length from one to two feet; bright rose-red, silvery beneath. Native of the European seas; considered as an excellent fish for the table.

gurnardus. *Gray gurnard*.—Triple fingers; back marked with black and red spots; length of the preceding. Native of the European seas, and not uncommon about our own coasts. Feeds on testaceous and crustaceous animals, spawns in May and June, and is good eating.

hirundo. *Tub fish, or sapphirine gurnard*.—Triple fingers, lateral line aculeated. Size of the gray gurnard. Native of the European seas. Occasionally springs out of the water to some distance.

Flying gurnard.—Sextuple fingers, connected by a ^{Abdominal} membrane. A highly singular and beautiful species, ^{Fishes.} which inhabits the Mediterranean, Atlantic, and Indian seas, where it swims in shoals, and frequently flies out of the water to a considerable distance. ^{volitans.}

The *carolina*, *alata*, *minuta*, *cavillone*, *panclata*, *adriatica*, *pini*, *chabrontera*, *cuculus*, *lucerna*, *lineata*, *asiatica*, and *evolans*, also belong to this genus.

Gen. 32. TRACHICHTHYS.

Trachichthys.

Head rounded in front; eye large; mouth wide, toothless, descending; gill-membrane furnished with eight rays, of which the four lowermost are rough on the edges; scales rough; abdomen mailed with large carinated scales.

Southern trachichthys.—Mailed abdomen. The whole ^{australis.} of this curious fish is strongly coated, and of a bright pink ferruginous colour. It is a native of the coasts of New Holland, and is minutely described by Dr Shaw, in his *Naturalists Miscellany*, and in the fourth volume of his *General Zoology*; a work from which we have derived much assistance in the complement of the present article.

IV. ABDOMINAL.

The fishes of this order have the ventral situated behind the pectoral fins, or on the abdomen. They are mostly inhabitants of the fresh waters.

Gen. 1. COBITIS.

Cobitis.

Head small, oblong, and scaleless; eye in the upper part of the head; nape flat; gill-membrane from four to six-rayed; gill-covers formed of a single plate, shutting close below; body covered with mucus and small deciduous scales, and variegated with bands and spots, almost equal; the tail towards the caudal fin being a little narrowed; back straight, with a single fin; lateral line scarcely visible; vent near the tail, and the tail rounded.

Common, or bearded loche.—Six beards; head smooth, ^{barbatula.} and compressed. About three inches in length; mouth small, toothless, and placed beneath. Common in clear rivulets in many parts of Europe. Lives on aquatic insects, worms, &c. Spawns in spring, is very prolific, dies very soon after being taken out of the water, and even where placed for any length of time in still water. It is very delicate eating, but quickly loses its fine flavour.

Spiny loche, or the armed loche.—Six beards, a spine ^{tænia.} below the eyes. Resembles the preceding, and is found in various parts of Europe, concealing itself below stones, feeding on worms, aquatic insects, and the spawn and fry of fishes. It is about five inches long; is tenacious of life, utters a hissing sound when handled, and is seldom eaten by man.

Great loche.—Eight beards; a spine above the eye. ^{fosfilis.} The largest of the genus, inhabiting large lakes, and marshes in the midland countries of Europe. Restless on the approach of stormy weather.

The other known species are *heteroclitia* and *japonica*.

Gen. 2.

Abdominal
Fishes.

Gen. 2. ANABLEPS.

anableps. Head somewhat depressed; mouth terminal; teeth small, and placed on the jaws; eyes protuberant, with double pupils; gill-membrane six-rayed.

etrophthalmus. *Four-eyed anableps.* *Cobitis anableps* of Linnæus.—Yellowish-gray, with longitudinal black lines on each side. Length from six to eight or ten inches. Its general appearance like that of a loche; but its eyes differ from those of every known fish, each being apparently divided into two distinct eyes, united in a common receptacle; on dissection, however, this observation is found to apply only to the anterior half of the organ. This fish is a native of South America, principally frequenting the rivers of Surinam, near the sea-coasts.

Gen. 3. AMIA.

Head bony, naked, rough, and furnished with sutures; teeth acute, and close in the jaws and palate; two beards at the nose; gill-membrane twelve-rayed; body scaly.

calva. *Carolinian amia.*—With a black spot at the tail; small, of a roundish form, and seldom eaten. Inhabits Carolina.

Gen. 4. SILURUS.

Head naked, large, broad, and compressed; mouth furnished with beards; gape and throat wide; lips thick; jaws dentated; tongue thick, smooth, and very short; eyes small; gill-membrane furnished with from four to sixteen rays; body elongated, compressed, scaleless, covered with viscid slime; lateral line near the back; the first ray of the pectoral fins, or of the dorsal fin, spiny, and dentated backward.

lanis. *Sly, or European silurus.*—One soft dorsal fin; six beards. Grows to the length of eight, ten, or even fifteen feet, and to the weight of three hundred pounds; but its ordinary size is from two to three or four feet. It is sluggish, and usually lies half imbedded in the soft bottoms of the rivers which it frequents, with its mouth half-open, moving about its beards, which the smaller fishes mistaking for worms, lay hold of, and are entrapped. It inhabits the larger rivers of Europe, as well as some parts of Asia and Africa, but is in no high estimation as a food.

electricus. *Electric silurus.*—With one adipose dorsal fin, and six beards. About twenty inches long, very broad in the fore-part, depressed, and of a cinereous colour, with some blackish spots towards the tail. Is found in some rivers in Africa, and when struck, gives a galvanic shock, though not so strong as that from the torpedo and gymnotus. It is used as food.

scita. *Asiatic silurus.*—Brown, ash-coloured beneath, with beards longer than the body; forked tail, and eleven rays in the anal fin. The young of this species are excluded in the form of large ova, the integuments of which they soon break, but adhere to the parent till the yolk is consumed. Native of India.

atus. *Cat silurus.*—The hinder dorsal fin adipose; twenty rays in the anal fin, and eight beards. Inhabits the sea and rivers of North America, preying on all kinds of smaller fishes and not sparing even those of its own

kind. Tastes like an eel, and is much relished by the Americans.

Abdominal
Fishes.

The other species are denominated *militaris*, *bagre*, *hertzbergii*, *incrimis*, *galeatus*, *nodosus*, *binaculatus*, *faciatus*, *clavias*, *quadrinaculatus*, *erythropterus*, *batrachus*, *fossilis*, *vittatus*, *atherinoides*, *afotus*, *mystus*, *anguillaris*, *undecimalis*, *cornutus*, *felis*, *cous*, *carinatus*, *docmac*, *chilensis*, and *bagad*.

Gen. 5. PLATYSTACUS.

Platyfascus.

Habit of silurus; mouth beneath, bearded with cirrhi; body scaleless, depressed; tail long, compressed.

Acetabulated platystacus. *Silurus aspredo* of Linnæus. *cotylephorus.* Grows to the length of a foot or more, has a very uncouth appearance, and is remarkable for the many small acetabular processes, or suckers, with which the body is beset. Native of the Indian seas and rivers.

Smooth platystacus.—Eight beards, and plain abdomen. Very like the preceding, but wants the abdominal suckers.

Warted platystacus.—Brown, marked above by longitudinal warted lines, with short anal fin. Smaller, and less elongated than the two preceding. Native of the Indian seas.

Eel-shaped platystacus.—Brown, with longitudinal white stripes, and the second dorsal, anal, and caudal fin united. Length twelve or fifteen inches. Native of the Indian seas.

Gen. 6. LORICARIA.

Loricaria.

Head smooth, depressed; mouth without teeth, and retractile; gill-membrane six-rayed; body covered with a hard crust.

Ribbed loricaria. *Silurus costatus* of Linnæus.—Yellowish brown, mailed with a single row of shields on each side; tail forked. This is a species of great strength and boldness, which inflicts very painful and dangerous wounds with its spines. It is a native of the Indian and American seas.

Armed loricaria.—One dorsal fin, two beards; length about ten or twelve inches. Much allied to the preceding, but has a rounded tail. Native of the American seas.

Soldier loricaria. *Silurus callichthys* of Linnæus.—Brown; with depressed rounded head, double row of scales on each side, and rounded tail. Native of South America, where it is in considerable esteem as a food.

Speckled loricaria.—Yellow, with brownish back; double row of scales on each side; fins speckled with black; and forked tail. Only five or six inches long, but very elegant. Native of the rivers of Surinam.

Toothed loricaria.—Lengthened; yellowish brown; with toothed, bearded mouth, and slightly pointed snout. Native of the Indian seas.

Yellow loricaria. *Loricaria plecostomus* of Linnæus.—Yellow, spotted with brown; two dorsal fins; and tail marked by transverse bands. Native of the Indian seas.

Gen. 7. SALMO.

Salmo.

Head smooth and compressed; mouth large; lips small; tongue white, cartilaginous, and moveable; eyes middle-sized; lateral teeth in the jaws and tongue; gill-membrane furnished with four to ten rays; gill-cover

Abdominal
Fishes

cover consisting of three plates; body elongated, covered with round scales minutely striated; back straight; lateral line straight, and near the back; hinder dorsal fin adipose; ventral fins many-rayed.

Most of the fishes of this genus frequent pure and rapid streams, a few of them inhabit the sea, but enter rivers for the purpose of depositing their spawn in spring, and return to the sea in autumn. They feed on insects and other fishes, and their flesh is much relished as a food. We shall confine our notices to a few of the most important and remarkable species.

salar.

Common salmon.—The upper jaw projecting beyond the under. The general length of the salmon is from two and a half to three feet; but is said to be sometimes found the length of six feet, and Mr Pennant mentions one of 74 pounds weight as the largest he ever heard of. The general colour of both sexes is a silvery gray, of a much darker cast on the back; the sides of the male are marked with many small, dusky and copper-coloured spots, while the markings on the female are larger, more distant, and roundish, or lunated. The male is also of a more slender form than the female. This fish, which is so highly esteemed for the delicacy of its flavour, and which forms such an important article of commerce, occurs chiefly in the salt and fresh waters of the northern regions, being unknown in the Mediterranean and other warm climates; but frequenting some of the rivers in France, which empty themselves into the ocean, and being found as far north as Greenland and the northern parts of North America. It quits the sea at certain periods to deposit its spawn in the gravelly beds of rivers, often ascending to a great distance from their mouths, forcing itself against the most rapid streams, and leaping with surprising agility over cataracts of a considerable height. On the river Liffey, the salmon are often observed to fall back before they surmount the cataract, which is 19 feet high; and baskets are placed near the edge of the stream to catch them in their fall. At the falls of Kilmorack in Scotland, where the salmon are very numerous, the country people are accustomed to lay branches of trees on the edge of the rocks, and thus intercept such of the fish as miss their leap. Alongside one of these falls the late Lord Lovat ordered a kettle full of water to be placed over a fire, and many minutes had not elapsed before a large salmon made a false leap and fell into it. When the salmon enter the fresh water in winter, they are more or less infested with the salmon-louse, (*Lernæa salmonea* Lin.) and are then reckoned to be in high season. These insects, however, soon die and drop off, and the fish becomes lean at spawning time. The male and female unite in forming a receptacle in the sand or gravel, about 18 inches deep, for the ova, and having covered up the latter, which are not hatched till the ensuing spring, hasten to the salt water much emaciated, and soon recover their plumpness. The fry appear about the end of March, and are five or six inches in length, in the beginning of May, when they are called *salmon smelts* or *smouts*. The first flood sweeps them in immense swarms into the sea. About the middle of June, the largest of these begin to return into the rivers. Towards the end of July, they are called *gulse*, and weigh from six to nine pounds. Their food is other fish, insects, and worms; but as no food is found in their stomach during

At dominal
Fishes.

spawning time, it is probable that they neglect it during that season. The fishing season commences in the Tweed on the 30th of November, and ends about old Michaelmas day. A particular account of this fishery occurs in the third volume of Pennant's British Zoology, to which we beg leave to refer our readers.—“A person of the name of Graham (says Mr Bingley), who farms the sea-coast fishery at Whitehaven, has adopted a successful mode of taking salmon, which he has appropriately denominated *salmon-hunting*. When the tide is out, and the fish are left in shallow waters, intercepted by sand banks, near the mouth of the river; or when they are found in any inlets up the shore, where the water is not more than from one foot to four feet in depth, the place where they lie is to be discovered by their agitation of the pool. This man, armed with a three-pointed barbed spear, with a shaft of 15 feet in length, mounts his horse, and plunges, at a swift trot, or moderate gallop, belly deep, into the water. He makes ready his spear with both hands; when he overtakes the salmon, he lets go one hand, and with the other strikes the spear, with almost unerring aim, into the fish: this done, by a turn of the hand he raises the salmon to the surface of the water, turns his horse head to the shore, and runs the salmon on dry land without dismounting. This man says, that by the present mode he can kill from 40 to 50 in a day: ten are however no despicable day's work for a man and horse. His father was probably the first man that ever adopted this method of killing salmon on horseback.”—In the intestinal canal of salmon is often found a species of *tenia*, about three feet in length; and Dr Bloch mentions, that in a specimen which had been three weeks dead, he found one of these worms still living.

Gray salmon, or gray.—With ash-coloured spots, the extreme part of the tail equal. Weighs from 13 to 20 pounds. The head is larger in proportion than in the preceding species; it is a strong fish, and does not ascend the fresh water till August, when it rushes up with great violence, and is seldom taken.

Salmon trout, sea trout, or bull trout.—Marked with black ocellated spots, the middle brownish, six dots on the pectoral fins. The general appearance very like the common salmon, but seldom equal to it in size. Like the salmon, it inhabits the European seas, passing into rivers to deposit its spawn. Its flesh, too, is of equal delicacy. The viscid mucus which covers the skin possesses the quality of exhibiting phosphoric light.

Common trout.—With red spots, the lower jaw rather longer than the upper. The general length of this species is from 12 to 15 or 16 inches; the ground colour yellowish gray, darker on the back, and marked on the sides by several straggling, round, bright-red spots, each surrounded by a tinge of pale blue gray. The colouring however, is subject to considerable variety. The trout is a common inhabitant of European streams and lakes, preferring those that are clear and cold, living on worms, small fishes, and aquatic insects and their larvæ. Like the salmon, it occasionally springs over obstacles in its course. It usually spawns in September, or October. Those which are in most request for the table, are natives of the clearest waters.—The gillaroo trouts which are found in the lakes of Galway, in Ireland, are not specifically different from the common, but their stomachs acquire an extraordinary degree

Abdominal Fishes. Degree of thickness and muscular force, a circumstance which is ascribed to their living much on shell-fish, and swallowing small stones.

ucho. *Hucho salmon.*—Oblong, two rows of teeth in the palate, marked with slightly blackish spots. More slender shaped than the common salmon, and its flesh not so firm. Inhabits the Danube, the Bavarian and Austrian lakes, and the rivers of Russia and Siberia.

pinus. *Alpine trout, or charr.*—Back black, sides bluish, belly reddish yellow. Length about a foot. In great request for the table. Native of the Alpine lakes and rivers, as well as of those of Germany, Lapland, Sweden, &c. Found in some of the lakes of Cumberland and Westmoreland, Loch-Leven in Scotland, &c.

velinus. *Salvelin trout, or red charr.*—About a foot in length, the upper jaw longest. Inhabits nearly the same regions as the preceding, and is equally esteemed for the delicacy of its flavour.

erlanus. *Smelt salmon, or smelt; spirling or spurling of the Scotch.*—Head transparent, 17 rays in the anal fin. Of an elegant, tapering form, and of a very peculiar flavour, which some compare to rushes, others to violets, and others to cucumbers. It varies in length, from six to 12 inches, inhabits the seas of Europe, and ascends rivers for the purpose of spawning, early in spring. In the Thames and the Dee, however, they are taken in great quantities in November, December, and January. There is a smaller variety which abounds in the north of Europe.

varcus. *Gwyniad salmon, or gwyniad.*—The upper jaw longest, 14 rays in the dorsal fin. Resembles a trout, but is thicker in proportion. Inhabits the lakes of the Alpine parts of Europe, and those of Cumberland, Wales, and Ireland. It occurs also in Loch Lomond, in Scotland, where it is called *powan*. A fisherman at Ullswater is said to have taken between seven and eight thousand of this species at one draught. Its usual length is from ten to twelve inches. According to Dr Bloch, the *gwyniad* also inhabits the northern sea, and the Baltic.

bula. *Maranula salmon.*—Jaws without teeth, the under one longest. Length about six inches; shape like that of a trout, but more slender. Native of several of the European lakes, and much esteemed as a food. At Lochmaben, the only place in Scotland where it occurs, it is called *uvangis*. According to tradition, it was brought to Lochmaben, from England, in the time of Robert Bruce.

ymallus. *Grayling salmon, or grayling.*—Upper jaw the longest, 23 rays in the dorsal fin. About the length of 18 inches. Frequents the clearer and colder rivers in many parts of Europe and Asia, particularly those which flow through mountainous countries. It is an elegant species, voracious, and of quick growth; spawns in April and May; has white, firm, and fine flavoured flesh, and is considered to be in highest season in the middle of winter.

To this genus also belong *lenok, nelina, taihsen, erythrinus, phinoc, salmulus, schieffermülleri, gædenü, salmarinus, carpio, lepechini, lacustris, umbra, argentinus, arcticus, flagnalis, rivalis, stroemii, saurus, tumbil, fatens, græniandicus, dentex, gibbosus, notatus, bimaculatus, immaculatus, cyprinoides, niloticus, ægyptius, pulverulentus, anglossus, rhomleus, gasteropolecus, salcaius, fasciatus, frederici, unimaculatus, melanurus, ful-*

vus, migratorius, autumnalis, wartmanni, rostratus, Abdominal nassus, maræna, peled, pidtschan, mudschan, jchokur, Fishes. mülleri, vimba, oxyrhynchus, leucichthys, and edentulus.

Gen. 8. ACANTHONOTUS.

Acantho-
notus.

Body elongated, without dorsal fin. Several spines on the back and abdomen.

Snouted acanthonotus.—Gray, with the back transversely barred with brown. The only known species of this genus. The specimen described by Bloch measured two feet and a half. Native of the Indian seas.

Gen. 9. FISTULARIA.

Fistularia.

Snout cylindrical, with jaws at the apex; gill membrane seven-rayed.

Slender fistularia, or tobacco-pipe fish.—Tail bifid and setiferous. Length three or four feet, shape resembling that of an eel; the head about nine inches long, from the eyes to the tip of the mouth. From the middle of the furcature of the tail, proceeds a very long and thickish brittle, like whalebone, which gradually tapers to a very fine point. The spine of this singular fish is also of a very peculiar structure, the first vertebra being of immoderate length, the three next much shorter, and the rest gradually decreasing as they approach the tail. It inserts its long snout into the hollows of rocks, under stones, &c. to lay hold on the smaller fishes, worms, and sea insects on which it chiefly feeds. Inhabits America and Japan, and is edible.

Chinese fistularia, or chinese trumpet fish.—Simple rounded tail. Body thicker in proportion than in the preceding species. Native of the Indian seas, though its fossil impressions have been found under the volcanic strata of *Monte Boko*, near Verona.

Paradoxical fistularia.—Finely reticulated, with slightly prominent lines, and lanceolate tail. Length from two to four inches, body angular, and the whole fish bearing a close resemblance to a *Syngnathus*. Native of the Indian seas.

Gen. 10. ESOX.

Esox.

Head somewhat flat above; mouth and gullet wide; jaws dentated, unequal; the upper plane, under punctured; tongue broad and loose; palate smooth; eyes round, middle sized, and lateral; nostrils double; near the eyes rays; body elongated, covered with hard scales, convex above, compressed at the sides; lateral line straight, nearest the back, scarcely conspicuous; dorsal and anal fins very short and opposite.

Sea-pike, or spit-fish.—Two dorsal fins, the anterior spiny. Of a silvery bluish colour, dusky on the back, and slightly tinged with yellow on the head and about the gills. Grows to the length of nearly two feet. Inhabits the Mediterranean and Atlantic; and has somewhat the flavour of the cod.

Bony-scaled pike.—Upper jaw the longest, scales bony. This last character gives it a very singular appearance. It attains to the length of three to four feet, inhabits the American lakes and rivers, is very voracious, and is an excellent fish for the table.

Common pike or pickerel.—Snout depressed, and nearly equal. Head very flat; the teeth very sharp and numerous, being disposed not only in front of the upper jaw,

Abdominal
Fishes.

jaw, but in both sides of the lower, in the roof of the mouth, and often on the tongue, amounting to at least 700. The ordinary colour of this fish is pale olive gray, deepest on the back, and marked on the sides by several yellowish spots; the abdomen is white, slightly spotted with black. According to Pennant, the largest specimen of English growth weighed 35 pounds. Those of Lapland sometimes measure eight feet. It is a proverbially voracious species. "We have known one, (says Mr Pennant), that was choaked by attempting to swallow one of its own species that proved too large a morsel. Yet its jaws are very loosely connected, and have on each side an additional bone like the jaw of a viper, which renders them capable of greater distension when it swallows its prey. It does not confine itself to feed on fish and frogs; it will devour the water rat, and draw down the young ducks as they are swimming about. In a manuscript note, which we found, p. 244, of our copy of *Plott's History of Staffordshire*, is the following extraordinary fact: "At Lord Gower's canal at *Trentham*, a pike seized the head of a swan as she was feeding under water, and gorged so much of it as killed them both. The servants perceiving the swan with its head under water for a longer time than usual, took the boat, and found both swan and pike dead."—The smaller fishes manifest the same uneasiness and horror at the presence of the pike, as little birds at the sight of the hawk or owl. If we may credit some naturalists of name, the longevity of the pike is not less remarkable than its voracity. *Rzazynski*, in his *Natural History of Poland*, tells us of one that was 90 years old; but *Gesner* relates, that in the year 1497, one was taken near *Hailburn*, in *Swabia*, with a brazen ring affixed to it, on which were these words in Greek characters: "I am the fish which was first of all put into this lake by the hands of the Governor of the Universe, Frederick the Second, the 5th of October 1230."—The pike spawns in March and April, and is said to be of very quick growth.

Gar-pike, gar-fish, or horn fish.—Both jaws subulated. General length from two to three feet, the body slender, and the belly flat. The back is of a very fine green, beneath which is a rich changeable blue and purple cast, while the sides and belly are of a bright silver colour. The jaws are very long and slender, and the edges of both are armed with numerous short slender teeth. Native of the European seas, arriving in shoals on the British coasts, preceding the mackerel. The spine and bones acquire a green colour by boiling, notwithstanding which it is eaten with perfect safety.

The other species are *barracuda, vulpes, malabaricus, synodus, hepsetus, argenteus, gymnocephalus, brasiliensis, chirocentrus, chinensis, aureoviridis, becuna, saurus, cepedianus, chilensis, viridis, and stomias.*

Gen. 11. POLYPTERUS.

niloticus. Gill-membrane single-rayed; dorsal fins numerous.

Nilotic polypterus.—Green, with the abdomen spotted with black. Of a long and serpentine shape, the body being nearly cylindrical, and covered with strong and adhering scales. The pectoral and ventral fins are attached by a scaly base; and the dorsal, to the number of 16, 17, or 18, and of an ovate shape, run along the whole length of the back. Native of the Nile, and

one of the best fishes which that river produces, but very rare. The Egyptians call it *bichir*.

Gen. 12. ELOPS.

Head smooth; numerous small teeth in the margin of the jaw and in the palate; gill-membrane with 30 rays, and armed in the middle externally with five teeth.

Saury elops, great saury, sein-fish, or sea gally-wasp, saurus.—The tail armed above and below with a spine. About 14 inches long, and has some resemblance to a salmon, but wants the adipose fin. Native of the American seas.

Gen. 13. ARGENTINA.

Teeth in the jaws and tongue; gill-membrane eight-rayed; vent near the tail; ventral fins with many rays.

Pearl-bladdered argentine.—Anal fin nine-rayed. A small brilliant fish, inhabiting the Mediterranean, and affording, by its air-bladder and scales, some of the best kind of silvery matter used in the preparation of artificial pearls.

The other species are *glossodonta, carolina, and machinata.*

Gen. 14. ATHERINA.

The upper jaw somewhat flat; gill-membrane six-rayed, a silvery stripe along the side.

Mediterranean atherine.—About 12 rays in the anal fin. An elegant species, of the length of six or seven inches, and shaped like a smelt. Native of the Mediterranean and Red seas. Also found on the coast of Southampton, where they are often called by the name of *smelts*.

To the same genus belong *menidia, sifama, japonica, brofontii, and pinguis.*

Gen. 15. MUGIL.

Lips membranaceous, the under one carinated within; no teeth, but a denticle above the opening of the mouth; gill-membrane 7-rayed; gill-covers smooth, rounded; body whitish.

Mullet, or common mullet.—Five rays in the first dorsal fin.—Length from 12 to 16 inches; colour bluish gray, darker on the back, and silvery on the abdomen. Very common in the Mediterranean and northern seas, chiefly haunting the shallows near the shores, and feeding on marine worms, insects, and plants. It likewise occurs in the Indian and Atlantic oceans. In the spring and early summer months, it ascends rivers. The roe is often prepared into an inferior kind of caviar, called *botargo*; and the fish itself, though not fashionable in our own country, is reckoned excellent for the table. In plentiful seasons, it is dried and salted.

The other species are *crenilabis, albula, malabaricus, tang, plumieri, caeruleomaculatus, chilensis, and chanos.*

Gen. 16. EXOCOETUS.

Head scaly, no teeth; jaws convex on both sides; gill-membrane ten-rayed; body whitish, belly angulated; pectoral fins very long, adapted to flying; the rays carinated before.

lebius.
lupea.
Oceanic flying fish.—Abdomen carinated on both sides. Of a bright silver colour, gradually deepening into purplish brown on the back; the pectoral fins dusky, the dorsal and anal yellowish, and the ventral fins and tail reddish. It is a native of the American and Indian seas, but is occasionally observed in the Mediterranean; and Pennant mentions an instance of its being seen about the British coasts. The largeness of the air-bladder, and the peculiar structure of the mouth, which can be closed while the jaws are open, assist its power of flight.

Mediterranean flying fish.—The ventral fins reaching to the tail. The general length of this species is from 12 to 15 or 16 inches; and its general shape is not unlike that of a herring, to which it is also compared as an eatable fish. It is of a bright silvery cast, with a blue or dusky tinge on the upper part. It is frequently observed in the Mediterranean and Atlantic, sometimes singly, and sometimes in shoals. During the decline of its flight, it sometimes falls into ships; the height, however, at which it generally exercises its flight, is about three feet above the surface of the water. From the length and size of the pectoral fins, it is enabled to continue this motion through the air to the distance of 200 or 300 feet, when the fins becoming dry, it is again obliged to have recourse to the water. Here it is persecuted by the dorado, bonito, dolphin, and other predacious fishes, while, in its aerial career, it is equally harassed by the gull and the albatross.

American flying fish.—Silvery bluish, with the ventral fins situated on the middle of the abdomen. Native of the Atlantic ocean.

Commersonian flying fish.—With a dark blue spot on the dorsal fin. Native of the Indian seas.

Gen. 17. POLYNEMUS.

Head compressed and scaly; snout very obtuse and prominent; gill-membrane with five or seven rays, separate finger-like processes at the pectoral fins.

Paradise polyneme, the fish of Paradise, or mango fish.—Seven fingers, and forked tail. Grows to the length of about 12 or 15 inches, and the thoracic filaments are very long, the outer ones often extending beyond the tail, and the others gradually shortening. It inhabits the Indian seas, and is reckoned by much the most delicate fish at Calcutta.

Plebeian polyneme.—Five fingers, the first reaching beyond the vent, the others gradually shorter. Resembles a mullet, except that the head is much blunted. It sometimes measures upwards of four feet, is a native of the Indian and American seas, and is considered as an excellent fish for the table.

Quinquarius, niloticus, decadaetylus, indicus, tetradactylus, virginicus, commersonii, and plumieri, compose the rest of the genus.

Gen. 18. CLUPEA.

Head compressed; mouth compressed, and denticulated within; jaws unequal, the upper furnished with serrated side-plates. tongue short, rough, with teeth turned inwards; eyes middle-sized, round and marginal; gills internally setaceous, their covers consisting of three or four plates, the membranes eight-

rayed; body compressed, elongated, covered with scales, lateral line straight, near and parallel to the back; under part of the abdomen forming a serrated ridge; ventral fins often with nine rays, caudal long and forked.

Herring.—Without spots; the under jaw the long-barengus. est. In size, this well-known fish is found to vary very considerably, though the general length may be reckoned from 10 to 12 or 13 inches. The back is of a dusky blue or greenish, and in the recent or living fish, the gill-covers are marked by a reddish or violet-coloured spot. The scales are rather large, and adhere slightly. The fins are rather small, and the tail is much forked. In most specimens, the anal fin has 17 rays. The herring inhabits the northern seas of Europe, and the Atlantic ocean, and is seldom found farther south than the coast of France. Its food principally consists of small fishes, sea worms, and a minute species of crab, *cancer halecum*, which abounds in the Norwegian seas. When it has fed on this last, its intestines are filled with the red ova of the insect, and is unfit for being salted. At spawning time its stomach is always empty, which seems to indicate that, like the salmon, and some other fishes, it is, at that season, quite negligent of food. Herrings spawn at different seasons, some in spring, some in summer, and some in autumn, when they approach our shores in immense shoals. But the reality of their long and periodical migrations is by no means ascertained. On the contrary, it is more probable, that, like the mackerel, they pass the winter in deep water, or in the soft mud at the bottom, at no very great distance from the shores. They are, in fact, found about some of the European coasts at almost every season of the year; and the alleged rapidity of their northern voyages greatly exceeds the swiftest progress of which they are capable. They are the ceaseless prey of several of the cetaceous tribe of animals, of various fishes, and of different sorts of sea fowl, particularly of the gannet, or solan goose. Notwithstanding the great importance of this fish to the inhabitants of modern Europe, we find no certain description of it in any of the Greek or Roman writers. The Dutch engaged in the herring-fishery in 1164, and the discovery of the pickling process is ascribed to *William Beukelen*, of Biervliet, near Sluys. He died in 1397; and Charles V. in honour of his memory, paid a solemn visit to his tomb.

Pilchard.—Silvery, with dusky back, and large *pilchardus*. strongly adherent scales. Very like the preceding, but smaller and thicker, with larger scales, and the dorsal fin placed exactly in the centre of gravity. Very frequent on some of the European coasts. Usually visits the shores of Cornwall in vast shoals, about the middle of July, and disappears on the commencement of winter. On the 5th of October, 1767, there were included in St Ives' Bay 7000 hogheads, each of which contained 35,000 fish, in all 24 millions.

Sprat.—With 16 or 17 rays in the dorsal fin. *Aspratius*. very small species, like the fry of herring; but it has a strongly serrated abdomen, and only 48 vertebræ in the back-bone, whereas the herring has 56. Inhabits the northern and Mediterranean seas, and approaches the shores in countless swarms, in autumn.

Shad.—Black spots on the sides, the snout bifid. In *alusa*. general appearance resembles the pilchard; but is much larger,

Abdominal Fishes. larger, and much thinner in proportion. Native of the Mediterranean and northern seas. In spring, it ascends rivers for the purpose of depositing its spawn. Like the herring, it dies almost immediately on being taken out of the water. Though prepared for the table in many countries, it is rather coarse and insipid.

encrascolus. *Anchovy.*—The upper jaw longest. Usual length from three to four inches, of a somewhat lengthened form, and covered with large, thin, and easily deciduous scales. Native of the Mediterranean, northern, and Atlantic seas. Spawns from December to March. It is in great request as a pickle, the bones dissolving entirely in boiling. The principal anchovy fishery is about the small island of Gorgona, near Leghorn.

The remaining species are *malabarica*, *africana*, *sinensis*, *thryssa*, *gigantea*, *atherinoides*, *setirostris*, *dorab*, *tuberculata*, *chrysoptera*, *fasciata*, *nasus*, *macrocephala*, and *tropica*.

Cyprinus.

Gen. 19. CYPRINUS.

Without teeth; mouth in the apex of the head, and bifurcated; gill-membrane three-rayed; body smooth and whitish; ventral fins generally nine-rayed.

Most of the cyprini inhabit the fresh waters, and are much esteemed as food. They live on clay, mould, worms, insects, and leguminous and aquatic plants, though some of them also prey on other fishes. Most of them spawn in April or May.

barbus. *Barbel.*—Anal fin seven-rayed, four beards; second ray of the dorsal fin serrated on both sides. Has somewhat the habit of a pike, and is usually found in deep and rapid rivers in most of the middle and southern parts of Europe. It is easily distinguished by its two pair of long and unequal beards. Its ordinary length is from 18 inches to two feet. Though capable of swimming with strength and rapidity, it sometimes allows itself to be taken by the hand by divers employed for the purpose. It is a coarse fish; and the roe is said to operate as an emetic and cathartic.

carpio. *Carp.*—Anal fin nine-rayed, four beards, the second ray of the dorsal fin serrated behind. The most common colour of this species is a yellowish olive, much deeper on the back, with a gilded tint on the side. In our own country it measures from 12 to 16 inches in length; but in warmer climates attains to a much larger size, and sometimes weighs from 20 to 40 pounds. It feeds chiefly on worms and water insects, and frequents the lakes and small rivers in the southern parts of Europe, usually decreasing in size the farther it is removed into a northern region. It is very tenacious of life, and may be kept for a considerable time in any damp place, though not immersed in water; and well authenticated instances are quoted of its attaining to the age of more than a century. It is said to have been introduced into England about the year 1514. In Germany and Poland, it is cultivated as a considerable article of commerce. A carp of three pounds weight will produce 237,000 ova, and one of nine pounds, 621,600. A green pigment is obtained from its bile, and ink-glass from its air-bladder. It is reckoned one of the most delicate of fresh-water fishes. A variety occurs in some parts of Germany, with very large scales, and termed by Bloch *rex cyprinorum*.

gobio. *Gudgeon.*—Anal fin eleven-rayed, two beards. Ge-

neral length from four to five or six inches; the body thick and somewhat cylindrical, for the most part of a pale olive brown above, the sides silvery, and the abdomen white. This is a very prolific species, and deposits its spawn, at intervals, in the spring. Inhabits small lakes and gently flowing rivers in most parts of Europe, and is particularly abundant in some parts of Germany, especially in autumn. In request for the table.

Tench.—Anal fin with 25 rays; tail entire; body slimy; two beards. The ordinary length of the tench is about 12 or 14 inches; but it varies considerably both in size and colour, according to its situation. It resides in stagnant waters with muddy bottoms, in moist parts of the globe, deposits its minute greenish ova in May and June. is very prolific, of quick growth, and is supposed by some to hibernate in the mud of the waters which it inhabits. It is reputed a delicate fish for the table. In Mr Daniel's Rural Sports, we find the following remarkable passage. "A piece of water, at Thornville Royal, Yorkshire, which had been ordered to be filled up, and wherein wood, rubbish, &c. had been thrown for years, was, in November, 1801, directed to be cleared out. Persons were accordingly employed, and, almost choked up by weeds and mud, so little water remained, that no person expected to see any fish, except a few eels; yet nearly 200 brace of tench, of all sizes, and as many perch were found. After the pond was thought to be quite free, under some roots there seemed to be an animal, which was conjectured to be an otter; the place was surrounded, and on opening an entrance among the roots, a tench was found of a most singular form, having literally assumed the shape of the hole, in which he had of course for many years been confined. His length from fork to eye, was two feet nine inches; his circumference, almost to the tail, was two feet three inches; his weight 11 pounds, nine ounces and a quarter: the colour was also singular, his belly being that of a charr, or a vermilion. This extraordinary fish, after having been inspected by many gentlemen, was carefully put into a pond; but, either from confinement, age, or bulk, it at first merely floated, and at last, with difficulty, swam gently away. It is now alive and well."

Crassian.—Anal fin ten-rayed, lateral line straight. Length from eight to ten inches; shape very deep, with considerable thickness; colour deep olive yellow, with a silvery tint on the abdomen. Inhabits ponds and large stagnant waters in many parts of Europe. Grows slowly, and is much infested by the *lerna cyprinacea*. Spawns but once in two years, and is in considerable esteem as an eatable fish.

Golden carp, or gold-fish. Two anal fins, the caudal transverse and forked. This favourite ornament of our houses and gardens, is a native of the southern parts of China, and exists in its natural state in a large lake in the province of Kiang, whence it has been diffused over the country, and cherished with fondness and attention. It is said to have been first introduced into England in 1691. In its domestic state, it is subject to very considerable variations in colour, form, and even number of fins. It may be fed with fine bread crumbs, small worms, water-wailes, yolk of eggs dried and powdered, &c. and should be supplied with a frequent change of water.

Minor.

Abdominal Fishes. *Minow*.—Anal fin eight-rayed; a brown spot at the tail; body transparent. A small, but elegant and familiar species, frequenting the small gravelly streams in many parts of Europe and Siberia. In our own country it appears first in March, and disappears about the beginning of October, when it secretes itself in the mud. It is gregarious, and fond of warmth, often swimming in shoals near the surface of the water, in clear hot weather. It feeds on herbs and worms, is very prolific, and of a delicate flavour, though seldom prepared for the table, on account of its smallness. It is more frequently used as bait for other fishes.

Uelfcus. *Dace, or dare*.—Eighteen rays in the anal, and nine in the dorsal fin. Length from six to eight or ten inches. In manners, allied to the roach, and inhabits lakes and rivers in many parts of Europe. Little esteemed for the table.

tilus. *Roach*.—Anal fin with 12 rays; ventral rays of a blood-red colour. Silvery, with a cast of dull yellow, more dusky on the upper parts; fins red. Frequents deep, still, and clear rivers in most of the middle parts of Europe, often appearing in large shoals, preceded by one or more, apparently stationed as a kind of guard. It spawns about the middle of May, and is very prolific. It usually weighs about a pound, or a pound and a half. Its flesh is white, firm, and well tasted, but not held in any great repute.

fus. *Orf*.—Thirteen rays in the anal fin. Length from 10 to 12 inches, or more. Resembles the gold-fish, and kept in small ponds on account of its beautiful appearance. Native of many parts of Germany, Russia, &c.

tytrophalmus. *Rud*.—Anal fin with 15 rays; fins red. About 8 or 10 inches long. Native of several parts of Europe, in lakes and rivers with a gravelly bottom. Reputed edible, and in season in summer.

es. *Chub*.—Fourteen rays in the anal fin; snout rounded. Resembles the tench, but has a more lengthened form, and a thicker head in proportion. Ordinary length from 14 to 18 inches. Native of many parts of Europe, and not uncommon in Great Britain, occurring chiefly in clear and rapid rivers. Rather coarse and unpalatable, and apt to acquire a yellow colour in boiling.

urnus. *Bleak*.—Twenty rays in the anal fin. Length five or six inches; shape slender; colour bright silvery. From its scales is prepared the silvery matter used in the manufacture of artificial pearls.

ama. *Bream*.—Twenty-seven rays in the anal fin; the fins brown. Of a very broad or deep shape, and from two feet to two and a half long. Of an olive hue, with a pale or flesh-coloured tinge on the under parts. Inhabits the lakes and rivers of many parts of Europe. As an article of food, it is reckoned rather coarse and insipid.

Besides the above, this genus likewise comprehends the *rondeletii, gibelio, blicca, ballerus, pomeranicus, simbriciatus, cirrhosus, falcatus, americanus, biörkna, faronus, grislagine, bynni, bulatmai, capota, caucus, malchus, julus, buphthalmus, quadrilobus, tincaurea, ferrugineus, nigro-auratus, viridi-violaceus, punctatus, amarus, sericeus, capito, cultratus, cephalus, aspius, idus, nasus, ferta, dobula, lancastrienfis, murfa, regius, lacteo, leptoccephalus, catastomus, galian, clupeoides, gonorhynchus, aphyra, and rivularis.*

Gen. 20. MORMYRUS.

Cartilaginous Fishes.
Mormyrus.

Snout produced; mouth terminal; teeth several, and emarginated; aperture without gill-cover; gill-membrane single-rayed; body scaly.

In consequence of Geoffroy's recent investigations, this hitherto obscure genus is ranked in the abdominal order; and the number of species has been increased from three to nine. They are all natives of the Nile.

Anguilliform mormyrus, has a sharp snout, equal anguill-jaws, 26 rays in the dorsal fin, and a bifid acute tail.

The other species are *kannume, oxyrhynchus, salalia, bebe, herse, cyprinoides, bané, and kasselquistii.*

V. CARTILAGINOUS.

THE fishes of this order have their fins furnished with cartilaginous rays. Their lungs are more similar to the gills of fishes than to the pulmonary system of the mammalia and amphibia; and in some of the genera are found both lungs and gills.

Gen. 1. OSTRACION.

Ostracion.

Teeth pointing forward; body mailed by a bony covering.

Triquetral or three-sided trunk-fish.—Body triangular and unarmed. This species is of a trigonal shape, measures about 12 inches in length, and except to within a small distance from the tail, is completely enveloped in a bony covering, divided into hexagonal spaces. Its prevailing colour is brown, with a white spot in the centre of each hexagon, which is also marked by fine rays diverging from the centre to the edges. Native of the Indian and American seas, and highly esteemed as an eatable-fish among the East Indians.

The generic characters of the trunk-fishes are readily recognised; but the specific marks are not easily ascertained. Dr Shaw enumerates, in addition to the preceding, *trigonus, biaculeatus, cornutus, tricornis, quadricornis, turritus, concaicnatus, nasus, cubicus, melagris, auritus, striatus, tuberculatus, and gibbosus.*

Gen. 2. TETRODON.

Tetrodon.

Jaws bony, divided at the tip; body roughened beneath; no ventral fins.

The fishes of this genus, like the diodons, have the power of inflating their body at pleasure, by means of an internal membrane for that purpose; and during the time of inflation, the small spines dispersed over their sides and abdomen are raised in such a manner as to operate as a defence against their enemies. They are chiefly natives of the tropical seas, though sometimes seen in the higher northern and southern latitudes, and are supposed to live principally on the crustaceous and testaceous animals.

Electric tetrodon.—Body brown above, yellow on the sides, sea green beneath, and varied with red, green, and white spots. Length seven or eight inches. Inhabits rocky places among the corals, in the Indian and American seas; and, when touched, affects the hand with a galvanic shock.

Ocellated

Ocellated tetradon.—Dull green; whitish beneath, with a black crescent over the shoulders, and spot on the back, both edged with yellow. Inhabits the Indian seas, and sometimes the adjoining rivers, particularly those of China and Japan. It is of a very poisonous nature; and the emperor of Japan prohibits his soldiers, under very severe penalties, from eating it. The *sceleratus* is also reputed highly noxious.

The other species are *lagocephalus*, *lineatus*, *lispidus*, *testudineus*, *spengleri*, *honkenii*, *oblongus*, *lævigatus*, *stellatus*, *punctatus*, *meleagris*, and *rostratus*.

Diodon.

Gen. 3. DIODON.

Jaws bony, undivided; body beset with moveable spines.

hystrix.

Porcupine diodon.—Of a spherical form, with triangular spines. Of a considerable size, sometimes measuring two feet in length. It possesses the power of inflating and contracting itself at pleasure, remarkable instances of which property it is said to exhibit when taken with a line and hook. Its flesh is coarse, though sometimes eaten by the inhabitants of the West-Indian islands.

atinga.

Oblong diodon.—With round spines. Nearly allied to the preceding, and considered as poisonous.

The remaining species are denominated *orbicularis*, *plumieri*, and *liturosus*.

Cephalus.

Gen. 4. CEPHALUS.

Jaws bony; body terminating abruptly, so as to resemble the head of a fish.

brevis.

Short sun-fish, or *short diodon*. *Tetrodon mola* of Linnaeus.—Body suborbicular, very short and broad, terminating abruptly on the hind part, where it is edged by a shallow fin. The general colour brown, with a silvery cast on the sides and abdomen. Native of the northern seas, where it sometimes arrives at the length of eight or even ten feet, and to the weight of 500 pounds. Also a native of the Atlantic and Ethiopian sea. It is said to exhibit a strong phosphoric light during the night. The *oblong* is probably only a variety of this species, as La Cépède has observed intermediate gradations between the two. The *variegated* is distinguished by whitish undulations and spots; and the *palladian* by its silvery hue, brownish back, and spiny carinated abdomen.

Syngnathus.

Gen. 5. SYNGNATHUS.

Snout subcylindrical, with terminal mouth; body lengthened, jointed, and mailed; no ventral fins.

acus.

Great pipe-fish, or *longer pipe-fish*.—Caudal, anal, and pectoral fins radiated; body hexangular. Generally from twelve to fifteen inches long, but sometimes from two to three feet; of a very slender form, and of a pale yellowish brown colour, with broad alternate zones of a deeper brown. In spring, as in others of this genus, the ova appear in an appropriate channel at the lower part of the abdomen, and the young are excluded from them completely formed. Native of the European seas. The *typhle*, or *smaller pipe-fish*, seems to be only a variety.

kipocampus. *Sea-horse*, or *sea-horse pipe-fish*.—Tail quadrangular,

without a terminating fin; body heptangular and tuberculated. General length from six to ten inches; body much compressed; colour greenish brown, varied with darker and lighter specks. In its living state, the head and tail are carried nearly straight, but when dry or contracted, it resembles the skeleton of a horse. It is a native of the Mediterranean, northern, and Atlantic seas.

Foliated pipe fish.—Blackish olive, with white specks, and leaf-shaped appendages. These last are situated on very strong, rough, square spines or processes attached to the back, tail, and abdomen, and give the whole animal a very grotesque and anomalous appearance. This curious species is a native of the Indian seas; but nothing particular seems to be known relative to its habits or natural history.

The *ophidion*, *biaculeatus*, *pelagicus*, *æquoreus*, and *barbarus*, require no particular description.

Gen. 6. PEGASUS.

Pegasus.

Mouth beneath, with a retractile proboscis; upper jaw elongated, denticulated, ensiform under the snout and linear; gill-aperture simple, placed before the pectoral fins; body compressed, articulated with bony incisions, and covered with a hard crust; ventral fins placed behind the pectoral.

Little or dragon pegasus.—Snout conical. Only *draconis*, three or four inches long, with large pectoral fins, which enable it to support itself for some moments in the air, when it springs occasionally over the surface of the water. Native of the Indian seas.

Flying-pegasus.—Snout ensiform and denticulated. Length three inches. Native of the Indian seas.

Swimming pegasus.—Snout ensiform and unarmed. Length three or four inches; more slender than the preceding. Native of the Indian seas.

Gen. 7. CENTRISCUS.

Centriscus.

Head produced into a very narrow snout; no teeth; the lower jaw longest; gill-aperture waving; body compressed; abdomen carinated; ventral fins united.

Mailed or shielded trumpet-fish.—Back smooth, with a hard shield, like a thin plate; eight inches long. Native of the Indian seas.

Snipe centriscus.—Body scaly and rough; tail straight and extended. Smaller than the preceding. Native of the Mediterranean and Indian seas. Ranked among edible fishes.

Light-armed centriscus.—Half-shielded, silvery, with subrecumbent dorsal spine. Length about two inches. Native of the Indian seas.

Gen. 8. BALISTES.

Balistes.

Head compressed, and an apparent continuation of the trunk, in some species, armed with a spine between the eyes; mouth narrow; eight teeth in each jaw; the two foremost longer than the rest; three interior teeth on both sides, resting against as many lateral ones; gill-aperture narrow, above the pectoral fins; gill-covers wanting; gill-membrane two-rayed; body compressed, carinated on the sides, with scales growing on the skin, and rough with sharp prickles.

Moff

Cartilaginous Fishes. Most of the species of this genus are natives of the Indian and American seas. They can in some degree indurate their abdomen by means of a strong bone, rough with small prickles, which lies under the skin. They feed on other fishes. Some of them are very large, and some remarkable for the brilliancy and variegations of their colours. In general, they are reckoned poisonous.

monoceros *Unicorn file-fish*.—A fin of one ray on the head; rays of the caudal fin carinated. The body is of an oval form, from one to two feet long, and covered all over with very minute spines. The general colour is gray, inclining to brown on the upper parts, and varied with irregular wavings and spots. Just above the eyes is a single spine of considerable length, a little recurved, and serrated on the hind part. Its food chiefly consists of crustaceous and testaceous animals.

capricornus *Mediterranean file-fish*.—Violet-gray, with red or blue variegations, single ventral fin, and rounded tail. Length of the preceding, and shape ovate. Almost the only species found in the European seas. The rays of the first dorsal fin are so continued as to act in concert with considerable force in raising the fin at the pleasure of the animal.

setula *Ancient file-fish, or old wife*. First dorsal fin three-rayed, ventral fin longitudinal; caudal bifid. Length from one to two feet, or more, general colour yellowish-olive, paler beneath. Several blue streaks on the front and cheek, and some transverse and longitudinal strips on the body. This species is supposed to have obtained its name from the mouth, when viewed in front, or from the slightly murmuring noise which it utters when first taken.

undulatus *Undulated file-fish*.—Black, but waved by oblique red lines. Observed about the shores of Sumatra by Mr Mungo Park.

The other sorts described by the most recent ichthyologists are, *hispidus, tomentosus, papillofus, chinensis, ringens, liturosus, levis, sonneratii, bicolor, virefcens, fasciatus, unimaculatus, cinereus, maculatus, aculeatus, verrucosus, biaculeatus, forcipatus, signatus, punctatus, capistratus, kleinii, curassavius, and affasi*.

Gen. 9. CYCLOPTERUS.

Head obtuse; mouth standing forward; tongue short and thick; jaws armed with small sharp teeth; gill-membrane four-rayed; gill-cover of one plate; body short, thick, and scaleless; ventral fins united into an orbicular membrane.

lumpus *Lump-fucker, lump-fish, sea-owl or cock paddle*.—Body angulated, with bony tubercle; grows to the length of 19 inches, and to the weight of seven pounds. It is of a deep and very thick shape, and swims edge-wise; the back is sharp and elevated, and the belly flat. There are four rows of large tubercles, and the whole skin is rough with smaller ones. On the upper part of the back is a thick ridge, destitute of spines. Beneath the pectoral fins is an oval aperture, surrounded with a fleshy muscular substance, edged with small filiform processes, which act as claspers. By means of this organ it adheres very strongly to any thing it pleases. The belly is of a bright crimson colour. Inhabits the northern, American, and Indian seas. Deposits its orange-coloured ova near the shore in April

and May. The Greenlanders boil the roe, which is very large, and eat both it and the fish. In England, the latter is sometimes stewed, but is starchy and insipid. The lump suckers are frequently devoured by seals, which leave the skins; numbers of which, thus emptied, may often be found in the spring, along those districts of shore which are frequented by this species, "It is easy, (adds Mr Pennant), to distinguish the place where seals are devouring this or any unctuous fish, by a smoothness of the water immediately above the spot." The *pavoninus*, or *pavonian sucker*, agrees with this species in all particulars, except size, and is therefore, probably only a variety. The *gibbosus* of Willoughby, or *pyramidal sucker*, seems also to belong to the same species, and to be distinguished only by the pyramidal elevation of the back.

Small sucker.—Body naked; snout marked above the mouth by three tubercles. A very small species, which inhabits the Atlantic ocean, and seems to be allied in habit to the common lump-fish. The body is compressed, of a whitish colour, and has two white unequal tubercles on each side.

Unctuous or snail-sucker.—Body naked; dorsal, anal, and caudal fins united. The length varies from five to eighteen inches. The shape is elongated, thick, compressed; the skin thin and lax, and covered with a viscid humour, like a snail. It is brownish, with darker stripes above, white beneath, and slightly yellow on the head and sides. It inhabits the northern seas, and sometimes ascends rivers.

Cornish or jura sucker, or lesser sucking-fish.—Of a purplish brown colour, with lengthened front. About four inches long; skin without scales, and slippery. Native of the European seas. Found by Dr Borlase on the coast of Cornwall, and by Mr Pennant in the sound of Jura.

Bimaculated sucker.—Body without scales; pectoral fins placed very high; a round black spot on each side of the ventral membrane. About an inch and a half long; the colour of the head and body fine pink. Inhabits the sea about Weymouth.

The remaining known species of this genus are, *dentes, gelatinosus, ventricosus, lineatus, and bispinosus*.

Gen. 10. LOPHIUS.

Lophius.

Head depressed; many sharp-pointed teeth; tongue broad; and armed with teeth; eyes on the upper part of the head; nostrils small; gills three; one lateral aperture; pectoral fins placed on the long branchiæ; dorsal and anal fins opposite, and near the tail; body scaleless, covered with a thin and lax skin; vent in the middle; no lateral line.

The fishes of this genus are of a singularly uncouth appearance; the body being thick and shapeless; the head excessively large, and the fins short and broad.

European or common angler, frog-fish, toad-fish, piscatorius, fishing-frog, sea-devil, &c.—Depressed; head rounded. The ordinary length of this species is from two to four feet, though it sometimes measures six or even seven feet. Its form resembles that of a tadpole. The skin of the trunk is smooth, but that of the upper parts marked by various inequalities. The eyes are large and whitish; the lower jaw is considerably longer than the upper. Two or three long, thread-like processes proceed

Cartilagi-
nous Fishes.

proceed from the upper part of the head, and some shorter ones from the back, while the edges of the body are fringed at intervals with shorter appendages of a somewhat similar nature. The upper surface is brown, with deeper or pale variegations, and the under surface whitish. The frog-fish inhabits the European seas; swims slowly; lies in ambush, in shallows, half-concealed by sea-plants or mud, and decoying its prey by moving its worm-like processes. It feeds on the dog-fish and smaller fishes. The *cornubiensis*, *cornish*, or *long angler*, or *fishing-frog of Mount's bay*, described by Borlase and Pennant, is so nearly allied to this that it may be regarded as only a variety.

hifrio.

Harlequin angler, or *American toad-fish*.—Compressed; of a yellowish brown colour, with irregular blackish spots, and beards on the head and body. This, which is one of the most grotesque and singular of fishes, is a native of the Indian and American seas, growing to the length of ten or twelve inches, and in manners resembling the European angler.

The other species are, *muricatus*, *vesperilio*, *striatus*, *pictus*, *marmoratus*, and *commerstonii*.

Accipenser.

Gen. II. ACCIPENSER.

Head obtuse; mouth placed under the head; retractile, toothless; four beards under the snout and before the mouth.

The fishes of this genus are among the largest of the tribe. They are all inhabitants of the sea, though some occasionally ascend rivers in great shoals. All the species are large, seldom measuring, when full grown, less than three or four feet in length. Their flesh is reckoned delicate and nutritious; and they form a very considerable article of commerce on the banks of the Caspian sea, and many parts both of Europe and America. They feed principally on worms and other fish.

sturio.

Common sturgeon.—Snout obtuse; the transverse diameter of the mouth equal to the longitudinal; the beards on the snout near the end of it; lips bifid. Of a long, slender, and pentagonal form, attaining sometimes to eighteen feet in length, and weighing five hundred pounds. The whole length of the body is covered by five rows of large, strong, and bony tubercles, rounded at the base, radiated from the centre, and terminated above by a sharp curved point in a reversed direction. The whole skin, on the upper parts and sides, is also roughened with very small tubercles of a similar structure. The general colour is cinereous above, and whitish or yellowish beneath. Though generally a sluggish fish, it sometimes springs out of the water with great force. It feeds on fishes, particularly the herring, salmon, mackrel, and coal-fish. It spawns in spring, and is amazingly prolific, Lewenhoeck having found in the roe of one of them 150,000,000,000 ova! It inhabits the ocean, the Mediterranean, and the Red, Black, and Caspian seas, especially such parts of them as are not remote from the estuaries of large rivers, which they occasionally ascend in great multitudes. In some of the rivers of Virginia they are so numerous that six hundred have been taken in two days merely by a pole, with a strong hook fixed to the end of it. The flesh is very delicate, white, and firm, and when roasted, is said to resemble veal. In this country it is usually served in a pickled state, being imported from

America and the Baltic. It is sometimes, however, taken in our rivers in the salmon-nets. The sturgeon was a fish in high repute with the Greeks and Romans, and according to Pliny, was brought to table with much pomp, and ornamented with flowers, the slaves who carried it being also ornamented with garlands, and accompanied by music. Caviar is made of the dried and salted roe. The skin makes a good covering for carriages.

Sterlet sturgeon.—Brownish, with the sides spotted with pale red, and the body shielded above by a triple series of tubercles. The smallest and most delicate species of the genus. Native of the Caspian sea, found also in the Volga and Ural, and occasionally in the Baltic. In seasons when this fish happened to be unusually dear, Prince Potemkin paid three hundred rubles for a single tubercle of sterlet soup, which formed the mere prelude to his repast.

Singlas's sturgeon, or *beluga*.—Snout very obtuse, transverse diameter of the mouth less than the longitudinal; beards near the mouth; lips not cleft. Larger than the common species, and sometimes measuring 25 feet in length. The tubercles are smaller than those of the *sturio*, and seem to fall off with age. Inhabits the northern, Caspian, and Mediterranean seas. Singlas is prepared from its snout or air-bladder, and an inferior sort from the skin, tail, stomach, and intestines. See ICHTHYOCOLLA.

To these may be added *schypa*, and *stellatus*; the first perhaps only a smaller variety of *sturio*, and the latter distinguished by the star-like marks on its head.

Gen. 12. CHIMÆRA.

Chimæra.

Head sharp-pointed; spiracles solitary, in four divisions under the neck; mouth under the head; upper lip with five divisions; fore teeth like cutting-teeth, two in each jaw; body long, with a single spine on the back; the tail ending in a brittle, and longer than the rest of the body.

Sea-monster, northern *chimæra*.—Punctured folds below the snout. A singularly grotesque species, inhabiting the northern and Atlantic ocean; frequenting the deepest recesses, preying on smaller fishes and mollusca and testacea; and rarely approaching the shore, except during the breeding season. It is from three to four feet long, of a lengthened and compressed form, tapering to the tail, which is produced into a long and slender filament. The head and eyes are very large; and at the base of each ventral fin, in the male, is a lengthened process, rough with numerous sharp prominences in a reversed direction. The whole body is of a yellow-brown above the lateral line, and of a bright silvery colour beneath it, variegated with numerous irregular deep brown or blackish spots and patches. Its flesh is considered as coarse and uneatable.

Elephant fish, or southern *chimæra*.—Snout produced beneath into an inflected lip. Native of the southern seas.

Gen. 13. SQUALUS.

Squalus.

Head obtuse, from four to seven semilunar spiracles on the sides of the neck; eyes oblong, half covered, placed before the temporal opening; mouth in the under part of the head, armed with several rows of serrated

Cartilagi-
ous Fishes.

ferrated sharp-pointed teeth, some of which are moveable, some fixed, and of different forms; body oblong, round, rough, with slender prickles; ventral fins, for the most part, less than the pectoral, close, placed about the vent, and in the males about the organs of generation.

The animals which compose this tribe are entirely marine, and more frequent in the hot than in the temperate climates. In general they are solitary, and often wander to great distances, devouring almost every thing that comes in their way, and that they are capable of swallowing. Some of them will follow vessels several hundred leagues for the carcases and offals. They sometimes attain to an enormous size, as they often weigh from one to four thousand pounds each. Some few species are gregarious, and live on the mollusca and other marine worms. They are all viviparous, and like the rays, protrude their young in pellucid horny cases, terminated at the four corners by long, slender filaments, and which are generally found twined round corallines, sea-weed, and other fixed substances. Their flesh is so tough, coarse, and unfavoury, that even the young are hardly eatable. Their bodies emit a phosphoric light in the dark.

anacula.

Panther shark, greater or spotted dog-fish.—Nostrils surrounded by a small lobe, and a vermiform appendage, ventral fins separated. Three or four feet long; brownish, with red or black spots; body cylindrical, but compressed at both extremities; skin rough, and when dried, used for polishing and other purposes. Inhabits the sea almost everywhere. The female breeds frequently, and brings about nineteen young at a time.

atulus.

Spotted shark, or lesser spotted dog-fish.—Nostrils surrounded by a small lobe and a vermiform appendage; ventral fins united. Length from two to three feet. Colour pale brick-red, with very numerous, small dusky spots. Very common in the European seas, very voracious, and a great annoyance to the fishermen. According to Pennant, it breeds from nine to thirteen at a time. Its liver is said to be highly noxious, inducing long continued stupor, succeeded by an universal itching and loss of the cuticle.

aleus.

Tope.—Teeth nearly triangular, and denticulated on the upper margin. Grows to five feet or more, is round and elongated, and often weighs upwards of 27 pounds. It is of a lighter or darker cinereous hue above, and whitish below. It smells very rank, and is so bold as to pursue its prey to the very edge of the shore. It inhabits the European ocean, and is frequently seen about the British coasts.

algana.

Hammer-headed shark, or balance-fish.—Head very broad and transverse, somewhat in the shape of a hammer. This deformed species measures from five to fifteen or seventeen feet. The body is rather slender, and somewhat cylindrical; the head dilated on each side to a great extent, with the eyes which are very large, placed at each extremity. It is brown above, and paler, or whitish beneath. Native of the Mediterranean and Indian seas, where it attacks such as are accidentally exposed to its fury, or are incautiously bathing or swimming in its neighbourhood. The natives of Otaheite, trusting to their dexterity in swimming, appear to hold it in contempt.

Heart-headed shark—Head very broad and heart-shaped. In other respects greatly allied to the preceding, but is much more rare, and chiefly inhabits the South American seas.

Cartilagi-
ous Fishes.
tiburo.

Blue shark.—Sides of the tail smooth, a cavity on the back of the tail. Of a more slender and elegant shape than the other species, measures from ten to fourteen feet, is of a blue-green above and white beneath. It is very bold and voracious; inhabits the European seas, and frequents several of the British coasts, especially those of Cornwall, during the pilchard season.

Porteagle shark.—A longitudinal fold on each side of the tail. Length from three to eight feet; shape round, except near the tail, where it is depressed; colour deep on the back, and white or silvery beneath. Inhabits the sea about Cornwall. The *monensis*, or *Beauman's shark* of Pennant, is now regarded only as a variety of *cornubicus*.

Basking shark.—With conical teeth, not ferrated. Body slender, and from three to twelve yards in length, of a deep lead colour above, and white below. The upper jaw is blunt at the end, and much longer than the lower. The mouth is furnished with a great multitude of small teeth, of which those in front are much bent, and the remote ones conical and sharp pointed. It has two dorsal, two pectoral, two ventral fins, and one small anal fin. This species inhabits the northern seas, and derives its name from its propensity to lie on the surface of the water, as if to bask in the sun, generally on its belly, and sometimes on its back. It feeds on sea-plants and medusa, and betrays none of that ferocity of disposition which characterizes most of the shark tribe; on the contrary, it seems so little afraid of mankind, as often to suffer itself to be patted and stroked. These animals frequent our seas during the warm summer months, and appear in shoals on the Welsh and Scottish coasts, after intervals of a certain number of years. They are observed in the frith of Clyde and among the Hebrides in small troops of seven or eight, or more commonly in pairs, about midsummer, and disappear about the latter end of July. They swim very deliberately, and generally with their upper fins above water. Sometimes they may be seen sporting among the waves, and springing several feet above the surface. They are pursued and taken by the fishermen for the sake of the oil contained in the liver; that vitæcus sometimes weighing a thousand pounds, and yielding eight barrels of oil, and two of useless sediment. When pursued, they do not quicken their motion till the boat is almost in contact with them, when the harpooner strikes his weapon into the body, as near the gills as he can. Sometimes they remain in the same place till the united strength of two men is exerted to force the instrument deeper. Then they plunge headlong to the bottom, and frequently coil the rope round their bodies, and endeavour to get rid of the harpoon by rolling on the ground. Discovering that these efforts are vain, they swim with such strength and rapidity, that one instance has occurred of a basking shark towing to some distance a vessel of 70 tons burthen, against a fresh gale. They sometimes run off with 200 fathoms of line, and two harpoons in them, and will employ the men from 12 to 24 hours before they are subdued. A large fish has afforded the captors a pro-

Cartilag-
eous Fishes.

fit of 20 pounds. "A male of this species (says Dr Shaw) was taken in the year 1801, at Abbotbury in Dorsetshire entangled in a fishing seine, and after a violent resistance, was dragged ashore. It is said to have received 17 musket-balls before it expired; its length was 28 feet, and its circumference in the thickest part about 20 feet; its tail, from point to point, near eight feet; the teeth, according to its proprietor, who took the pains to count them, amounted to the number of four thousand." The skin make excellent shagreen.

carc-
rias.

White shark.—Triangular serrated teeth. This species, so remarkable for its powers of destruction, is a native of most seas, but occurs more frequently in the warm than the cold latitudes. It arrives at the length of more than 30 feet, and is rather thicker and broader than most of its congeners. The mouth is very wide, and furnished on the margin of each jaw with from three to six rows of strong, flat, triangular, sharp-pointed, and finely serrated teeth, which can be raised or depressed at pleasure. The general colour of the animal is a pale ash, darker or browner on the upper parts. So great is the strength of the tail, that a young shark of six feet in length, is able by a stroke of this part to break a man's leg; hence it is usual for sailors to cut off the tail the instant they drag a shark on board. Gillius quotes a specimen which weighed four thousand pounds, and another in whose belly was found an entire human body; and Müller asserts, that in one taken at the isle of St Margaret, there was found a horse which had probably been thrown overboard from some ship. The size of the fossil teeth of this species, so often found in the isle of Malta, &c. affords a convincing proof of the enormous specimens which have once existed. Sharks are the dread of sailors in all hot climates, where they constantly attend the ships in expectation of what may drop overboard; and a man who has that misfortune is almost instantly devoured. In the pearl-fisheries of South America, every negro, to defend himself against these animals, carries with him into the water a sharp knife, which, if the fish offers to assault him, he endeavours to strike into its belly, on which it generally swims off. The officers who are in the vessels keep a watchful eye on these voracious creatures, and on discovering them, shake the ropes fastened to the negroes, to put them on their guard. Many, when the divers have been in danger, have thrown themselves into the water, with knives in their hands, and hastened to their defence: but too often all their dexterity and precaution have been of no avail.

pristis.

Saw-nouted shark, or saw-fish.—With a long flat snout, set with teeth on both sides through its whole length. Inhabits the southern and northern oceans, grows to fifteen feet in length, and is readily distinguished by its produced and saw-like snout, which is often preserved in museums.

acanthias.

Picked shark, or picked dog-fish.—Dorsal fin spinous; body somewhat round. Length from three to four feet; colour brownish ash above and white beneath; rough, with minute prickles, hooked backwards. Common in the European seas, especially about the coasts of Scotland and Norway. When split and dried, it is eaten by the common people.

squalina.

Angel-shark, or angel-fish.—Pectoral fins very large

and emarginated before. A deformed species, with large head and pectoral fins, and depressed body, attaining to six or eight feet in length. It is a native of the European seas, and is extremely voracious, fierce, and dangerous. It produces twelve or thirteen young at a birth.

The other known species of this genus are *vulpes, stellaris, mystelus, spinax, centrina, philippinus, cinereus, spinosus, isabella, cirrhatus, barbatus, africanus, ocellatus, griseus, americanus, squamosus, denticulatus, punctulatus, zebra, gronovianus, tentaculatus, and semi-gittatus.*

Gen. 14. SPATULARIA.

Spatularia.

Spiracles single on each side of the neck, concealed by a large gill-cover; snout produced, and shaped like a spatula; mouth beneath the head, large, and furnished with sharp serrated teeth.

Reticulated spatularia.—In habit and appearance this remarkable species is allied to the sharks, but distinguished by its thin snout, of the form of a spatula, and nearly equal in length to the whole remainder of the animal. Its history and manners are very imperfectly known.

Gen. 15. RAIA.

Raia.

Spiracles on the under part of the neck, ten on each side, oblique; mouth under the head, small, acuminate, as if continuous with the breast, transverse and dentated; body thin, depressed, and of a rhomboid figure.

The species of this genus are entirely confined to the sea, and, being destitute of an air-bladder, live chiefly at the bottom, generally in deep water, covering themselves in winter in sand or mud. They live on shell-fish, or other animal substances that fall in their way. Some of them become of a size so large as to weigh two hundred pounds and upwards. They seldom produce more than one young at a time, which, as in the sharks, is inclosed in a four-cornered capsule, ending in slender points, but not, as in the former, produced into long filaments. The liver is large, and often produces a great quantity of oil. They are mostly edible.

Torpedo, torpedo ray, cramp ray, cramp fish, &c.—*torpedo.* Wholly smooth. The body of this species is of a somewhat circular form, slightly convex above, marked along each side of the spine by several small pores, about eighteen inches, or two feet in length, and for the most part of a pale reddish brown on the upper surface, sometimes marked by five large circular and dusky spots, and whitish or flesh-coloured beneath. It inhabits most seas, but seems to thrive best in the Mediterranean, usually lying in water of about forty fathoms depth, in company with some of its congeners. It preys on smaller fish, which it is supposed to stupefy by its electric or galvanic faculty. This property, which has been so much exaggerated both by ancient and modern writers, is nevertheless, sufficiently remarkable. From some experiments which were made by Mr Wallis on a very stout and healthy fish, it appears that no spark could be discovered to proceed from it, and that pith-balls were never found to be affected by it. When insolated, it gave a shock to persons who were likewise

infulated, and even to several who took hold of each other's hands; this it did forty or fifty times successively, and with very little diminution of force. If touched only with one finger, the shock was so great as to be felt with both hands. Yet the animal was not able to transmit the shock across the minutest tract of air, nor from one link of a small chain freely suspended to another, nor through an almost invisible separation made by a penknife in a slip of tin-foil pasted on sealing-wax.

have to add *fullonica*, *ezlanteria*, *acus*, *nigra*, *picta*, *undulata*, *alba*, *marginata*, *chagrinea*, *aquila*, *guttata*, *saciatata*, *lymna*, *cuculus*, *sephen*, *tuberculata*, *paecilina*, *diabolus*, *manatia*, *giorna*, *fabroniana*, *bankiana*, *sembriata*, *maculata*, *bicolor*, *sinensis*, *rhinobatos*, *thoumiana*, *djidenfis*, and *cuvieri*.

Cartilaginous fishes.

Gen. 16. PETROMYZON.

Petromyzon.

Head more slender than the body; mouth larger above than below; teeth orange-coloured, hollow within, surrounded with a fleshy rim, curved above, broad below; seven spiracles at the sides of the neck; a fistulous opening at the back part of the head; no pectoral or ventral fins.

Lamprey, great lamprey, or sea lamprey.—Mouth *marinus*. within covered with papillæ; the hinder dorsal fin separate from the tail. In general appearance, approaches nearly to the eel tribe, especially to the murænæ. Though it sometimes exceeds three feet in length, the British specimens are usually of inferior size. Its general colour is a dull brownish olive, clouded with yellowish white variegations; the fins are tinged with dull orange, and the tail with blue. On the top of the head is a small orifice for the discharge of the superfluous water taken in at the mouth and gills. Among the cartilaginous fishes, none is so destitute of all appearance of real bone as the lamprey, in which, the spine itself is no other than a mere soft cartilage, without any processes or protuberances. The heart, instead of being inclosed in a soft pericardium, as in other animals, is guarded by a strong cartilaginous one; and the liver is of a fine grass-green colour. It inhabits the ocean, and ascends rivers chiefly during the latter end of winter and the early months of spring. It is viviparous; and the young are of slow growth. Though capable of swimming with rapidity, it is more commonly seen attached by the mouth to some large stone or other substance, and that with such power of adhesion, that a weight of more than twelve pounds may be raised without forcing the fish to forego its hold. It is supposed to live principally on worms and young fish. Like the eel, it is remarkably tenacious of life, the several parts, when cut in pieces, continuing to move, and the head strongly attaching itself for several hours to a stone, though by far the greater part of the body be cut away from it. "As an article of food, (observes Dr Shaw) the lamprey has for many ages maintained its credit as an exquisite dainty; and has uniformly made its appearance at the most splendid of our ancient entertainments. The death of King Henry I. it is well known, is attributed to a too luxurious indulgence in this his favourite dish. It still continues to be in high esteem; and we are told by Mr Pennant, that the city of Gloucester continues to send yearly, at Christmas, a present of a rich lamprey pye to the king. It sometimes happens that the lampreys at that season are so rare, that a guinea is demanded for the price of a single fish. They are most in season during March, April, and May, and are observed to be much more firm when fresh arrived from sea than when they have been a considerable time in fresh water. They are found in several of the British rivers, but that which is most celebrated for them is the Severn."

Lesser lamprey or lampern.—The hinder dorsal fin *fluvialis*. angulated.

Skate—Back smooth in the middle, with one row of spines. Common in the European seas. The general colour on the upper parts is a pale ash-brown, varied with several dusky undulations, and of the under parts white, marked with numerous distant black spines. In the male, the pectoral fins are bent towards their tips or edges with numerous small spines. In October, the skate is usually poor and thin, but begins to improve in November, and is reckoned to be in the highest perfection in May. Willoughby makes mention of a single skate of two hundred pounds weight, which was sold in the fish market at Cambridge to the cook of St John's College in that university, and was found sufficient to dine the whole society, consisting of more than 120 persons.

Sharp-nosed ray.—Ten aculeated tubercles along the middle of the back. In shape, resembles the preceding, but has a longer and sharper snout in the form of a spouton. Native of the Mediterranean and northern seas.

Mirror ray.—Back and belly smooth; spines at the region of the eyes, and a triple row of them at the tail. Each of the pectoral fins is marked about the middle, or near the body, with a large circular, eye-shaped spot, consisting of a purplish or dusky circle, with a whitish or yellowish centre. Inhabits the Mediterranean.

Rough ray.—One row of prickles on the back, and three on the tail. Greatly allied to the thorn-back; and rough, with many spines. Inhabits the Mediterranean and other seas.

Sting ray.—Body smooth; long serrated spine on the fore part of the tail; no dorsal fin. Shape somewhat rhomboidal; snout pointed; colour of the body yellowish olive above, and whitish beneath. With its long flattened spine, which is finely serrated in a reverse direction on both sides, it is capable of inflicting very severe wounds. As it is annually cast, the new spine sometimes arrives at a considerable size before the old one drops off, in which state the animal has been occasionally described as a distinct species. Though formerly supposed to contain a very active poison, this weapon is found to be wholly destitute of any venomous quality. Inhabits the European, Red, and Indian seas, and is ranked among the edible rays.

Thorn-back.—Prickly; teeth tuberculated; a transverse cartilage on the abdomen. Resembles the common skate, but is somewhat broader in proportion, and is easily distinguished from it by the very strong curved spines with which its upper surface is covered. It is an inhabitant of the Mediterranean and other seas, and esteemed as a food. The thorn-back begins to be in season in November, and continues so later than the skate; but the young of both are good at all times of the year.

To complete the specific catalogue of this genus, we

Cartilagi- nous Fishes. angulated. From 10 to 15 inches long; the back brown or dusky, sometimes clouded, or mixed with blue; the upper part of the body marked by numerous annular lines, and the whole under sides silvery. Inhabits the sea, and ascends, in spring, most of the European rivers, in which it is found much more frequently and plentifully than the great lamprey. It is often potted with the latter, and by some preferred to it, on account of its milder taste. The Dutch purchase vast quantities of this species as bait for their cod and turbot fisheries. In the river Bouter, in Couland, great quantities are taken from beneath the ice, with nets; they are much larger than those found elsewhere, and are packed in snow, and sent to any distance; and, when put into cold water, recover themselves. This species is so tenacious of life, that it will live many days out of the water.

branchialis. Minute lamprey or pride.—The hinder dorsal fin linear; the lips behind lobated. Has a worm-like appearance; measures from four to seven inches in length; is not observed to adhere to other bodies; inhabits the European rivers, and is more frequent in the Isis than elsewhere, in England.

The remaining species are *planeri*, *ruber*, *sanguisuga*, *argenteus*, *plumbeus*, and *bicolor*.

Gastrobranchus.

Gen. 17. GASTROBRANCHUS.

Body eel-shaped; mouth beneath, with numerous pectinate teeth; two spiracles beneath the abdomen.

cacus.

Blind gastrobranchus. Myxine glutinosa, Lin.—Livid, paler beneath; with eight beards at the mouth. Removed to the class of fishes, in consequence of Dr Bloch's accurate examination of its external and internal structure. In general appearance, in the situation of the mouth, and in the orange colour of the teeth, it approaches very near to the lamprey. But it is remarkable for the total want of eyes, no vestige of any such organ being discoverable by the most attentive examination. The body is destitute of scales, lateral line, and fins, except that shallow one which forms the tail. Beneath the body, from head to tail, runs a double row of equidistant pores. The spiracles, which are a pair of oval apertures, are situated beneath the body, at some distance from the head. This singular species is said to enter into the bodies of such fishes as it happens to find on the fisherman's hooks, and which consequently have not the power of escaping its attack, and by gnawing its way through the skin, to devour all the internal parts, leaving only the bones and the skin remaining. Such is its uncommon glutinous nature, that, if put into a large vessel of sea water, it soon renders the whole so viscid, as easily to be drawn out into the form of threads. It inhabits the northern seas, and seems also to occur in those of the southern hemisphere.

dombeyi.

Dombeyan gastrobranchus—Head tumid. Much larger than the European species; the head rounded, and larger than the body; four beards on the upper lip, the number of those on the lower uncertain, the specimen being described in a dried state. Eyes and nostrils imperceptible. Native of the South American seas. Observed by M. Dombey, and described by La Cépède from the dried skin in the Paris museum.

BEFORE we conclude this article, it may be proper to direct the reader's attention to M. Nouel's paper relative to two methods of multiplying fishes. The first consists in conveying from the lakes to the rivers, and from the rivers to the lakes, fish found only in one of them; the second, in introducing into fresh water, as it were insensibly, and by means of artificial ponds, fish produced in salt water, giving the preference to those species, which by their habits and manner of living, might be most adapted to this kind of naturalization.

The first of these methods has been successfully practised in Germany, with regard to the shad, in ponds and clear stagnant waters, with a bottom of sand or gravel. Perch and trout have, in like manner, been conveyed into lakes and rivers in Scotland, and have thriven remarkably well. The carp, which affects a warm temperature, has been successively introduced into the rivers and ponds of Prussia, Denmark, and England. M. Poivre first brought the *gourami* of Bengal into the isle of France, where it has greatly multiplied.

"Our rivers, (says this judicious writer), do not contain more than about twenty indigenous species, and some migratory fishes, which at certain periods of the year ascend to a certain distance from their mouths, or, like the salmon, swim towards their sources as far as they can. The small rivers possess still fewer species; the greatest part even are confined to the tench, the trout, eels, and some smaller fish of little value. How advantageous would it be to introduce into these rivers a multitude of foreign fish, which, in these waters could find aliment more agreeable to their taste, and which would enjoy a temperature as analogous to their wants, as favourable to their reproduction!

"The Seine, which I shall take as an example, nourishes many species of *salmo* and *cyprinus*: but how many other fish of the same kind might be propagated in it! If the Seine possess the salmon, it wants the *thymallus*, the *umber* of Auvergne, the *lavaretus*, the *muræna* of Germany, the *grilse* of Scotland, the *pala* of Switzerland, the *ferra* of the lake of Geneva, &c. Why should not the carp of the lago di Guarda, and the *schwarzritter* of the lakes of Berchitoldgaden, an excellent kind of salmon, highly praised by Baron de Moll, a naturalist of Salzbourg, succeed in France, if that bottom, to which they are most attached, were procured for them, at the foot of the Cevennes or the Vôges? Why might they not be afterwards gradually introduced into our small rivers? Can it be believed, that the numerous tribe of the trout kind, which swarm in the rivers of Scotland, would refuse to supply our colonies with their species? No. There can be no doubt that they would bring thither that fecundity, abundance, and riches, which render them so valuable to their native streams. The case would be the same with the *boudelles* and *hüglings* presented to us by the lakes of Switzerland, and with the gudgeon, the *cyprinus ballarus*, and the *salmo umbla*, bred in the rivers of Lower Germany. Let us open, then, with these countries a philosophical and liberal exchange of the best fish of France for those of which we wish to be possessed."

Nature herself seems to point to the success of the second method. In many instances, salmon and sturgeon have habituated themselves to a fresh-water residence.

denance. Pallas discovered the sea-dog in the lake Baikal; and Liancourt found the herring in several of the rivers of North America. It likewise deserves to be remarked that the large plaife, transported from the North sea to the ponds of East Frieland, have increased by myriads, and imparted great value to water which was formerly unproductive.

“ In the year 1799, (continues M. Nouel), I had the honour of reading, in one of the sittings of the National Institute, a memoir on the means and advantages of naturalizing the herring, a salt-water fish, in the waters of the Seine, near its mouth, &c. The account of the processes for accomplishing this end, which I there pointed out, are not susceptible of analysis, and cannot, therefore, be introduced into this essay; it will be sufficient for me to say, that the report of Lacépède, Cuvier, and Tessier, was entirely in their favour. At present, I am still more convinced of the efficacy of the means which I then proposed; and I have no doubt that, if artificial ponds were formed on the edges of rivers, the experiment would be attended with complete success. ‘ Every man, (says Dr Franklin), who catches a fish, draws from the water a piece of money’. Let not the maxims and example of this philosopher be lost to posterity; let them rather produce fruit, like strong and vigorous seed sown in a fertile soil. Having observed in New England, that the herrings ascended from the sea into one river of that country, while a

single individual was never seen in another river, separated from the former by a narrow tongue of land, which communicated also with the sea, this philosopher took the leaves of some plants on which the herrings had deposited their ova, already fecundated, and conveyed them to the river which was deprived of the annual visit of these fish. The success of this experiment surpassed his expectations; the ova were completely productive; and the following year the river was peopled with a numerous shoal of herrings, which, since that time, have continued to frequent it.

“ This fish is not the only one which I would add naturalized in fresh water; to the herring I would add several species of *pleuronectes*—also the mullet, goby, whiting, gar-fish, and perhaps, one or two species of the garnard. I would pay the greatest attention possible to the nature of the water proper for each species. This happy choice is the principal condition, and that which could ensure success; but I would select in particular for this colonization, the fish found in lakes, which, though little known, are more numerous than is commonly supposed, and ought to be so.”

By the adoption of this plan, which is susceptible of more ample developement, society would gain an increased quantity of provision, and the naturalist would multiply his opportunities of observation.

For the modes of preserving fish in cabinets, see *PRESERVING Fish*, means of.

EXPLANATION OF PLATES.

Plate CCLXXIX.

Explanation of Terms.—*a*, (fig. 2.) pectoral fins; *b*, ventral fins; *c, c*, anal fins; *d*, caudal fin, or tail; *e, e, e*, dorsal fins; *f*, bony plates that cover the gills; *g*, branchiostegous rays and their membranes; *h*, lateral or side line.

Fig. 1. *Anguilla Conger*. *Conger Eel*.—Example of apodal fishes, in which the ventral fins are wanting. The launce or sand-eel, the wolf-fish, and sword-fish, belong to this order.

Fig. 2. The Haddock, an example of jugular fishes, in which the ventral fins *b*, are placed before the pectoral fins *a*. To this order belong the dragonet, the cod-fish, the blenny, &c.

Fig. 3. The Father-lather, an example of thoracic fishes, in which the ventral fins *a*, are placed beneath the pectoral *b*; as in the bull’s-head, the dory, the mackerel, the perch, &c.

Fig. 4. The Minow, an example of abdominal fishes, having the ventral fins *a*, placed behind the pectoral fins *b*. To this order belong the salmon, the herring, the carp, &c.

Fig. 5. The Dog-fish, an example of cartilaginous fishes, in which the muscles are supported by cartilages instead of bones, and which breathe by means of apertures placed near the neck instead of gills; *a* the lateral apertures.

Fig. 6. *Gymnotus Electricus*, Electrical Gymnotus or Cramp-fish.

Fig. 7. *Trichiurus Lepturus*, Silvery Trichiurus.

Fig. 8. *Anarchichas Lupus*, Sea-wolf.

Fig. 9. *Odontognathus Aculeatus*.

Fig. 10. *Ammodytes Tobianus*, Sand-eel.

Fig. 11. *Ophidium Barbatum*, Bearded Ophidium.

Plate CCLXXX.

Fig. 12. *Sternoptyx Diaphana*, Transparent Sternoptyx.

Fig. 13. *Leptocephalus Morrifii*, Morris Launce.

Fig. 14. *Stylephorus Chordatus*, Chordated Stylephorus.

Fig. 15. *Callionymus Dracunculus*, Sordid Dragonet.

Fig. 16. *Uranoscopus Scaber*, Bearded Star-gazer.

Fig. 17. *Trachinus Draco*, Dragon Weever.

Fig. 18. *Gadus Molva*, Ling.

Fig. 19. *Blennius Pholis*, Smooth Blenny.

Fig. 20. *Kurtus Indicus*, Indian Kurtus.

Fig. 21. *Echineis Remora*, Indian Remora, or Longest Sucking-fish.

Plate CCLXXXI.

Fig. 22. *Coryphæna Hippurus*, Dolphin.

Fig. 23. *Macrourus Rupestris*, Long-tailed Immigrant.

Fig. 24. *Cottus Scorpius*, Lather, Bull-head, or Father-lather.

Fig. 25. *Scorpena Antennata*, Antennated Scorpion.

Fig. 26. *Zeus Faber*, Common Dory.

Fig. 27. *Pleuronectes Plateffa*, Plaife.

Fig. 28. *Chætodon Rostratus*, Beaked Chætodon.

Fig. 29. *Acanthurus Unicornus*, Unicorn Acanthurus.

Fig. 30.

Fig. 30. *Eques Americanus*, American Knight-fish.
 Fig. 31. *Trichopus Satyrus*, Satyr Trichopus.

Plate CCLXXXII.

Fig. 32. *Labrus Cyanopterus*, Blue-finned Labrus.
 Fig. 33. *Sciæna Unimaculata*, Single-spotted Sciæna.
 Fig. 34. *Perca Cernua*, Ruffe, or Ruffe Perch.
 Fig. 35. *Gasterosteus Spinachia*, Fifteen-spined Stickleback.
 Fig. 36. *Mullus Auriflamma*, Oriflamme Surmullet.
 Fig. 37. *Trachichthys Australis*.

Fig. 38. *Cobitis Taenia*, Spiny loche.
 Fig. 39. *Esox Aureo-viridis*, Gold-green Pike.
 Fig. 40. *Exocoetus Volitans*, Oceanic Flying-fish.

Plate CCLXXXIII.

Fig. 41. *Ostracion Cornutus*, Horned Trunk-fish.
 Fig. 42. *Diodon Brevis*, Short Sun-fish.
 Fig. 43. *Centrifcus Scolopax*, Snipe Centrifcus.
 Fig. 44. *Pegasus Draconis*, Dragon Pegasus.
 Fig. 45. *Accipenser Huso*, Hinglass Sturgeon.
 Fig. 46. *Squalus Canicula*, Panther Shark.

IC H

Ichthyophagi, ICHTHYOPHAGI, FISH-EATERS, a name given to a people, or rather to several different people, who lived wholly on fishes; the word is Greek, compounded of *ιχθυος*, *piscis*, "fish," and *φωγῆναι*, *edere*, "to eat."

The Ichthyophagi spoken of by Ptolemy are placed by Sanson in the provinces of Nanquin and Xantong. Agatharcides calls all the inhabitants between Carmania and Gedrosia by the name *Ichthyophagi*.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears indeed that they had cattle, but that they made no use of them, excepting to feed their fish withal. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors; and the mortars wherein they pounded their fish, and baked it at the sun, were nothing else but their vertebræ.

ICHTHYPERIA, an old term in *Natural History*, which is applied by Dr Hill to the bony palates and

IC O

mouths of fishes, usually met with either fossil, in single pieces, or in fragments. They are of the same substance with the bufontiæ; and are of very various figures, some broad and short, others longer and slender; some very gibbous, and others plainly arched. They are likewise of various sizes, from the tenth of an inch to two inches in length, and an inch in breadth.

ICKENILD-STREET, is that old Roman highway, denominated from the Icenians, which extended from Yarmouth in Norfolk, the east part of the kingdom of the Iceni, to Barley in Hertfordshire, giving name in the way to several villages, as Ickworth, Icklingham, and Ickleton in that kingdom. From Barley to Royston it divides the counties of Cambridge and Hertford. From Ickleford it runs by Tring, crosses Bucks and Oxfordshire, passes the Thames at Goring, and extends to the west part of England.

ICOLMKIL. See IONA.
ICONIUM, at present COGNI, formerly the capital city

Ickenild-Street
||
Iconium.

city of Lycaonia in Asia Minor. St Paul coming to Iconium (Acts xiii. 51. xiv. 1. &c.) in the year of Christ 45, converted many Jews and Gentiles there. It is believed, that in his first journey to this city, he converted St Thecla, so celebrated in the writings of the ancient fathers. But some incredulous Jews excited the Gentiles to rise against Paul and Barnabas, so that they were upon the point of offering violence to them, which obliged St Paul and St Barnabas to fly for security to the neighbouring cities. St Paul undertook a second journey to Iconium in the year 51; but we know no particulars of his journey, which relate peculiarly to Iconium.

ICONOCLASTES, or ICONOCLASTÆ, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters.—The word is Greek, formed from *εικων* *imago*, and *κλασειν* *rumpere*, “to break.”

In this sense, not only the reformed, but some of the eastern churches, are called *Iconoclastes*, and esteemed by them heretics, as opposing the worship of the images of God and the saints, and breaking their figures and representations in churches.

The opposition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks a little after the commencement of the eighth century, when the worship of them became common. See IMAGE. But the tumults occasioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The dispute, however, broke out with redoubled fury under Leo the Isaurian, who issued out an edict in the year 726, abrogating, as some say, the worship of images, and ordering all the images, except that of Christ's crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or worship. This edict occasioned a civil war, which broke out in the islands of the Archipelago, and by the suggestions of the priests and monks, ravaged a part of Asia, and afterwards reached Italy. The civil commotions and insurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his subjects in the Italian provinces violated their allegiance, and rising in arms either massacred or banished all the emperor's deputies and officers. In consequence of these proceedings, Leo assembled a council at Constantinople in 730, which degraded Germanus, the bishop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of severe punishments upon such as were attached to that idolatrous worship. Hence arose two factions; one of which adopted the adoration and worship of images, and on that account were called *iconoduli* or *iconolatres*; and the other maintained that such worship was unlawful, and that nothing was more worthy the zeal of Christians than to demolish and destroy those statues and pictures which were the occasions of this gross idolatry; and hence they were distinguished by the titles of *iconomachi* (from *εικων* *image*, and *μαχο* *I contend*;) and *iconoclastes*. The zeal of Gregory II. in favour of image worship, was not only imitated, but even surpassed by his successor Gregory III. in consequence of which the Italian provinces were torn from the Grecian empire.

Constantine, called *Copronymus*, from *κοπρος* “ster-

cus,” and *ωνυμ* “name,” because he was said to have defiled the sacred font at his baptism, succeeded his father Leo in 741, and in 754 convened a council at Constantinople, regarded by the Greeks as the seventh œcumenical council, which solemnly condemned the worship and use of images. Those who, notwithstanding this decree of the council, raised commotions in the state, were severely punished; and new laws were enacted, to set bounds to the violence of monastic rage. Leo IV. who was declared emperor in 775, pursued the same measures, and had recourse to the coercive influence of penal laws, in order to extirpate idolatry out of the Christian church. Irene, the wife of Leo, poisoned her husband in 780; assumed the reins of empire during the minority of her son Constantine, and in 786 summoned a council at Nice in Bithynia, known by the name of the *second Nicene council*, which abrogated the laws and decrees against the new idolatry, restored the worship of images and of the cross, and denounced severe punishments against those who maintained that God was the only object of religious adoration. In this contest, the Britons, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches, but they considered the worship of them as highly injurious and offensive to the Supreme Being. Charlemagne distinguished himself as a mediator in this controversy: he ordered four books concerning images to be composed, refuting the reasons urged by the Nicene bishops to justify the worship of images, which he sent to Adrian the Roman pontiff in 790, in order to engage him to withdraw his approbation of the decrees of the last council of Nice. Adrian wrote an answer; and in 794, a council of 300 bishops, assembled by Charlemagne at Francfort on the Maine, confirmed the opinion contained in the four books, and solemnly condemned the worship of images. In the Greek church, after the banishment of Irene, the controversy concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain success. The emperor Nicephorus appears upon the whole to have been an enemy to this idolatrous worship. His successor, Michael Curopalates, surnamed *Rhangabe*, patronized and encouraged it. But the scene changed on the accession of Leo the Armenian to the empire; who assembled a council at Constantinople in 814, that abolished the decrees of the Nicene council. His successor Michael, surnamed *Balbus*, disapproved the worship of images, and his son Theophilus treated them with great severity. However, the empress Theodora, after his death, and during the minority of her son, assembled a council at Constantinople in 842, which reinstated the decrees of the second Nicene council, and encouraged image worship by a law. The council held at the same place under Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commemoration of this council, a festival was instituted by the superstitious Greeks, called the *feast of orthodoxy*. The Latins were generally of opinion, that images might be suffered as the means of aiding the memory of the faithful, and of calling to their remembrance the pious exploits and virtuous actions of the persons whom they represented; but they detested all thoughts of paying them the least

Iconoclasts marks of religious homage or adoration. The council of Paris, assembled in 824 by Louis the Meek, resolved to allow the use of images in the churches, but severely prohibited rendering them religious worship. Nevertheless, towards the conclusion of this century, the Gallican clergy began to pay a kind of religious homage to the images of saints, and their example was followed by the Germans and other nations. However, the Iconoclasts still had their adherents among the Latins; the most eminent of whom was Claudius bishop of Turin, who, in 823, ordered all images, and even the cross, to be cast out of the churches, and committed to the flames; and he wrote a treatise, in which he declared both against the use and worship of them. He condemned relics, pilgrimages to the Holy Land, and all voyages to the tombs of saints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much less infected with superstition than the other parts of Europe. The controversy concerning the sanctity of images was again revived by Leo bishop of Chalcedon, in the 11th century, on occasion of the emperor Alexius's converting the figures of silver that adorned the portals of the churches into money in order to supply the exigencies of the state. The bishop obstinately maintained that he had been guilty of sacrilege; and published a treatise, in which he affirmed, that in these images there resided an inherent sanctity, and that the adoration of Christians ought not to be confined to the persons represented by these images, but extended to the images themselves. The emperor assembled a council at Constantinople, which determined, that the images of Christ and of the saints were to be honoured only with a relative worship; and that invocation and worship were to be addressed to the saints only as the servants of Christ, and on account of their relation to him as their master. Leo, dissatisfied even with these absurd and superstitious decisions, was sent into banishment. In the western church, the worship of images was disapproved and opposed by several considerable parties, as the Petrosobians, Albigenses, Waldenses, &c. till at length this idolatrous practice was entirely abolished in many parts of the Christian world by the Reformation. See **IMAGE**.

ICONOGRAPHIA (derived from εἰκων "image" and γράφω "I describe"), the description of images or ancient statues of marble and copper; also of busts and semi-busts, pendants, paintings in fresco, mosaic works, and ancient pieces of miniature.

ICONOLATRÆ, or **ICONOLATERS** (from εἰκων and λατρεύω "I worship,") or **ICONODULI** (from εἰκων and δούλω "I serve,") those who worship images: A name which the Iconoclasts give to those of the Romish communion, on account of their adoring images, and of rendering to them the worship only due to God. See **ICONOCLASTS** and **IMAGE**.

ICOSAHEDRON, in *Geometry*, a regular solid, consisting of 20 triangular pyramids, whose vertices meet in the centre of a sphere supposed to circumscribe it; and therefore have their height and bases equal: wherefore the solidity of one of these pyramids multiplied by 20, the number of bases, gives the solid contents of the icosahedron.

ICOSANDRIA (from εἰκοσι "twenty," and ἀνδρ

"a man or husband"); the name of the 12th class in Linneus's sexual method, consisting of plants with hermaphrodite flowers, which are furnished with 20 or more stamens, that are inserted into the inner side of the calyx or petals. See **BOTANY**, p. 192.

ICTINUS, a celebrated Greek architect who lived about 430 B. C. built several magnificent temples, and among others that of Minerva at Athens.

IDA, in *Ancient Geography*, a mountain situated in the heart of Crete where broadest; the highest of all in the island; round, and in compass 60 stadia (Strabo); the nursing place of Jupiter, and where his tomb was visited in Varro's time.—Another *Ida*, a mountain of Mysia, or rather a chain of mountains (Homer, Virgil), extending from Zeleia on the south of the territory of Cyzicus to Lectum the utmost promontory of Treas. The abundance of its waters became the source of many rivers, and particularly of the Simois, Scamander, Ælorus, Granicus, &c. It was covered with green wood, and the elevation of its top opened a fine extensive view of the Hellespont and the adjacent countries; from which reason it was frequented by the gods during the Trojan war, according to Homer. The top was called *Gargara* (Homer, Strabo); and celebrated by the poets for the judgment of Paris on the beauty of the three goddesses, Minerva, Juno, and Venus, to the last of whom he gave the preference.

IDALIUM, in *Ancient Geography*, a promontory on the east side of Cyprus. Now *Capo di Griego*; with a high rugged eminence rising over it, in the form of a table. It was sacred to Venus; and hence the epithet *Idalia* given her by the poets. The eminence was covered by a grove; and in the grove was a little town, in Pliny's time extinct. *Idalia*, according to Bochart, denotes the place or spot sacred to the gods.

IDEA, the reflex perception of objects, after the original perception or impression has been felt by the mind. See **METAPHYSICS**, *passim*; and **LOGIC**, Part I.

IDENTITY, denotes that by which a thing is itself, and not any thing else; in which sense *identity* differs from *similitude*, as well as *diversity*. See **METAPHYSICS**.

IDES, in the ancient Roman calendar, were eight days in each month; the first of which fell on the 15th of March, May, July, and October; and on the 13th day of the other months.—The origin of the word is contested. Some will have it formed from ιδειν "to see;" by reason the full moon was commonly seen on the days of the ides: others from ειδος "species, figure," on account of the image of the full moon then visible: others from *idulium* or *ovis idulis*, a name given by the Hetrurians to a victim offered on that day to Jupiter: others from the Hetrurian word *iduo*, i. e. *divido*; by reason the ides divided the moon into two nearly equal parts.

The ides came between the **KALENDS** and the **NONES**; and were reckoned backwards. Thus they called the 14th day of March, May, July, and October, and the 12th of the other months, the *pridie idus*, or the day before the ides; the next preceding day they called the *tertia idus*; and so on, reckoning always backwards till they came to the **NONES**. This method of reckoning time is still retained in the chancery of Rome,

Idiocy.

Rome, and in the kalendar of the Breviary.—The ides of May were consecrated to Mercury: the ides of March were ever esteemed unhappy, after Caesar's murder on that day: the time after the ides of June was reckoned fortunate for those who entered into matrimony: the ides of August were consecrated to Diana, and were observed as a feast day by the slaves. On the ides of September, auguries were taken for appointing the magistrates, who formerly entered into their offices on the ides of May, afterwards on those of March.

IDIOCY, a defect of understanding. Both idiocy and lunacy excuse from the guilt of crimes; (see **CRIME**, *par. ult.*) For the rule of law as to lunatics, which may also be easily adapted to idiots, is, that *furiosus furore solum punitur*. In criminal cases, therefore, idiots and lunatics are not chargeable for their own acts, if committed when under these incapacities: no, not even for treason itself. Also, if a man in his sound memory commits a capital offence, and before arraignment for it he becomes mad, he ought not to be arraigned for it: because he is not able to plead to it with that advice and caution that he ought. And if, after he has pleaded, the prisoner becomes mad, he shall not be tried: for how can he make his defence? If, after he be tried and found guilty, he loses his senses before judgment, judgment shall not be pronounced; and if, after judgment, he becomes of nonsane memory, execution shall be stayed: for peradventure, says the humanity of the English law, had the prisoner been of sound memory, he might have alleged something in stay of judgment or execution. Indeed, in the bloody reign of Henry VIII. a statute was made, which enacted, that if a person, being *compos mentis*, should commit high treason, and after fall into madness, he might be tried in his absence, and should suffer death, as if he were of perfect memory. But this savage and inhuman law was repealed by the statute 1 & 2 Ph. & M. c. 10. For, as is observed by Sir Edward Coke, "the execution of an offender is for example, *ut pena ad paucos, metus ad omnes perveniat*: but so it is not when a madman is executed; but should be a miserable spectacle, both against law, and of extreme inhumanity and cruelty, and can be no example to others." But if there be any doubt whether the party be *compos* or not, this shall be tried by a jury. And if he be so found, a total idiocy, or absolute insanity, excuses from the guilt, and of course from the punishment, of any criminal action committed under such deprivation of the senses; but if a lunatic hath lucid intervals of understanding, he shall answer for what he does in those intervals, as if he had no deficiency. Yet, in the case of absolute madmen, as they are not answerable for their actions, they should not be permitted the liberty of acting unless under proper controul; and, in particular, they ought not to be suffered to go loose, to the terror of the king's subjects. It was the doctrine of our ancient law, that persons deprived of their reason might be confined till they recovered their senses, without waiting for the forms of a commission or other special authority from the crown; and now, by the vagrant acts, a method is chalked out for imprisoning, chaining, and sending them to their proper homes.

The matrimonial contract likewise cannot take place

in a state of idiocy. It was formerly adjudged, that the issue of an idiot was legitimate, and his marriage valid. A strange determination! since consent is absolutely requisite to matrimony, and neither idiots nor lunatics are capable of consenting to any thing. And therefore the civil law judged much more sensibly, when it made such deprivations of reason a previous impediment, though not a cause of divorce if they happened after marriage. And modern resolutions have adhered to the sense of the civil law, by determining that the marriage of a lunatic, not being in a lucid interval, was absolutely void. But as it might be difficult to prove the exact state of the party's mind at the actual celebration of the nuptials, upon this account (concurring with some private family reasons *), the statute 15 Geo. II. c. 30. has provided, that the marriage of lunatics and persons under phrensies (if found lunatics under a commission, or committed to the care of trustees under any act of parliament) before they are declared of sound mind by the lord chancellor, or the majority of such trustees, shall be totally void.

Idiots and persons of nonsane memory, as well as infants and persons under duress, are not totally disabled either to convey or purchase, but *sub modo* only. For their conveyances and purchases are voidable, but not actually void. The king indeed, on behalf of an idiot, may avoid his grants or other acts. But it hath been said, that a *non compos* himself, though he be afterwards brought to a right mind, shall not be permitted to allege his own insanity in order to avoid such grant: for that no man shall be allowed to stupify himself, or plead his own disability. The progress of this notion is somewhat curious. In the time of Edward I. *non compos* was a sufficient plea to void a man's own bond: and there is a writ in the register for the alienor himself to recover lands aliened by him during his insanity; *dum fuit non compos mentis suæ, ut dicit*, &c. But under Edward III. a scruple began to arise, whether a man should be permitted to *demiss* himself, by pleading his own insanity; and, afterwards, a defendant in assize having pleaded a release by the plaintiff since the last continuance, to which the plaintiff replied (*ore tenus*, as the manner then was) that he was out of his mind when he gave it, the court adjourned the assize; doubting, whether as the plaintiff was sane both then and at the commencement of the suit, he should be permitted to plead an intermediate deprivation of reason; and the question was asked, how he came to remember to release, if out of his senses when he gave it? Under Henry VI. this way of reasoning (that a man shall not be allowed to disable himself, by pleading his own incapacity, because he cannot know what he did under such a situation) was seriously adopted by the judges in argument; upon a question whether the heir was barred of his right of entry by the feoffment of his insane ancestor? And from these loose authorities, which Fitzlerbert does not scruple to reject as being contrary to reason, the maxim that a man shall not stultify himself, hath been handed down as settled law: though later opinions, feeling the inconvenience of the rule, have in many points endeavoured to restrain it. And, clearly, the next heir or other person interested, may, after the death of the idiot or *non compos*, take advantage of his incapacity and avoid

Idiocy.

Idiom
||
Idleness.

the grant. And so, too, if he purchases under this disability, and does not afterwards upon recovering his senses agree to the purchase, his heir may either waive or accept the estate at his option. In like manner, an infant may waive such purchase or conveyance, when he comes to full age; or, if he does not then actually agree to it, his heir may waive it after him. Persons, also, who purchase or convey under duress, may affirm or avoid such transaction, whenever the duress is ceased. For all these are under the protection of the law; which will not suffer them to be imposed upon through the imbecility of their present condition; so that their acts are only binding, in case they be afterwards agreed to when such imbecility ceases. Yet the guardians or committees of a lunatic, by the statute 11 Geo. III. c. 20. are empowered to renew in his right, under the directions of the court of chancery, any lease for lives or years, and apply the profits of such renewal for the benefit of such lunatic, his heirs, or executors. See LUNACY.

IDIOM, among grammarians, properly signifies the peculiar genius of each language, but is often used in a synonymous sense with dialect. The word is Greek, *ιδιωμ* "propriety;" formed of *ιδιος* "proper, own."

IDIOPATHY, in *Physic*, a disorder peculiar to a certain part of the body, and not arising from any preceding disease; in which sense it is opposed to sympathy. Thus, an epilepsy is idiopathic when it happens merely through some fault in the brain; and sympathetic when it is the consequence of some other disorder.

IDIOSYNCRASY, among physicians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain disorders than persons of a different constitution usually are.

IDIOT, or IDEOT, in our laws, denotes a natural fool, or a fool from his birth. See IDIOCY.

The word is originally Greek, *ιδιωτης*, which primarily imports a *private person*, or one who leads a private life, without any share or concern in the government of affairs.

A person who has understanding enough to measure a yard of cloth, number twenty rightly, and tell the days of the week, &c. is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is considered by the law in the same state as an idiot.

IDIOT is also used, by ancient writers, for a person ignorant or unlearned; answering to *illiteratus* or *imperitus*. In this sense, Victor tells us, in his Chronicle, that in the consulship of Messala, the Holy Gospels, by command of the emperor Anastasius, were corrected and amended, as having been written by idiot evangelists: *Tanquam ab idiotis evangelistic composita*.

IDLENESS, a reluctance in people to be employed in any kind of work.

Idleness in any person whatsoever is a high offence against the public economy. In China it is a maxim, that if there be a man who does not work, or a woman that is idle, in the empire, somebody must suffer cold or hunger: the produce of the lands not being more than sufficient, with culture, to maintain the inhabitants; and therefore, though the idle person may shift off the want from himself, yet it must in the

end fall somewhere. The court also of Arcopagus at Athens punished idleness, and exerted a right of examining every citizen in what manner he spent his time; the intention of which was, that the Athenians, knowing they were to give an account of their occupations, should follow only such as were laudable, and that there might be no room left for such as lived by unlawful arts. The civil law expelled all sturdy vagrants from the city; and, in our own law, all idle persons or vagabonds, whom our ancient statutes describe to be

"such as wake on the night and sleep on the day, and haunt customable taverns and ale-houses, and routs about; and no man wot from whence they come, ne whether they go;" or such as are more particularly described by statute 17 Geo. II. c. 5. and divided into three classes, *idle and disorderly persons, rogues and vagabonds, and incorrigible rogues*;—all these are offenders against the good order, and blemishes in the government, of any kingdom. They are therefore all punished, by the statute last mentioned; that is to say, idle and disorderly persons with one month's imprisonment in the house of correction; rogues and vagabonds with whipping, and imprisonment not exceeding six months; and incorrigible rogues with the like discipline, and confinement not exceeding two years: the breach and escape from which confinement in one of an inferior class, ranks him among incorrigible rogues; and in a rogue (before incorrigible) makes him a felon, and liable to be transported for seven years. Persons harbouring vagrants are liable to a fine of forty shillings, and to pay all expences brought upon the parish thereby: in the same manner as, by our ancient laws, whoever harboured any stranger for more than two nights, was answerable to the public for any offence that such his inmate might commit.

IDOL, in pagan theology, an image, or fancied representation of any of the heathen gods.—This image, of whatever materials it consisted, was, by certain ceremonies, called *consecration*, converted into a god. While under the artificer's hands, it was only a mere statue. Three things were necessary to turn it into a god; proper ornaments, consecration, and oration. The ornaments were various, and wholly designed to blind the eyes of the ignorant and stupid multitude, who are chiefly taken with show and pageantry. Then followed the consecration and oration, which were performed with great solemnity among the Romans. See IMAGE.

IDOLATRY, or the worship of idols, may be distinguished into two sorts. By the first, men adore the works of God, the sun, the moon, the stars, angels, daemons, men, and animals: by the second, men worship the work of their own hands, as statues, pictures, and the like: and to these may be added a third, that by which men have worshipped the true God under sensible figures and representations. This indeed may have been the case with respect to each of the above kinds of idolatry; and thus the Israelites adored God under the figure of a calf.

The stars were the first objects of idolatrous worship, on account of their beauty, their influence on the productions of the earth, and the regularity of their motions, particularly the sun and moon, which are considered as the most glorious and resplendent images of the Deity: afterwards, as their sentiments became

Comment.

Idolatri,
Idomeneus.

more corrupted, they began to form images, and to entertain the opinion, that by virtue of consecration, the gods were called down to inhabit or dwell in their statues. Hence Arnobius takes occasion to rally the Pagans for guarding so carefully the statues of their gods, who, if they were really present in their images, might save their worshippers the trouble of securing them from thieves and robbers.

As to the adoration which the ancient Pagans paid to the statues of their gods, it is certain, that the wiser and more sensible heathens considered them only as simple representations or figures designed to recal to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the same sentiment is clearly laid down in Plato, who maintains, that images are inanimate, and that all the honour paid to them has respect to the gods whom they represent. But as to the vulgar, they were stupid enough to believe the statues themselves to be gods, and to pay divine worship to stocks and stones.

Soon after the flood, idolatry seems to have been the prevailing religion of all the world: for wherever we cast our eyes at the time of Abraham, we scarcely see any thing but false worship and idolatry. And it appears from Scripture, that Abraham's forefathers, and even Abraham himself, were for a time idolaters.

The Hebrews were indeed expressly forbidden to make any representation of God: they were not so much as to look upon an idol: and from the time of the Maccabees to the destruction of Jerusalem, the Jews extended this precept to the making the figure of any man: by the law of Moses, they were obliged to destroy all the images they found, and were forbidden to apply any of the gold or silver to their own use, that no one might receive the least profit from any thing belonging to an idol. Of this the Jews, after they had smarted for their idolatry, were so sensible, that they thought it unlawful to use any vessel that had been employed in sacrificing to a false god, to warm themselves with the wood of a grove after it was cut down, or to shelter themselves under its shade.

But the preaching of the Christian religion, wherever it prevailed, entirely rooted out idolatry; as did also that of Mahomet, which is built on the worship of one God. It must not, however, be forgotten, that the Protestant Christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of saints and martyrs: before these they burn lamps and wax candles; before these, they burn incense, and, kneeling, offer up their vows and petitions; they, like the Pagans, believe that the saint to whom the image is dedicated, presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the saint would no longer perform any miracle in that place.

IDOMENEUS, in fabulous history, succeeded his father Deucalion on the throne of Crete. He accompanied the Greeks to the Trojan war with a fleet of 90 ships. During this celebrated war he rendered himself famous by his valour, and slaughtered many of the enemy. At his return from the Trojan war, he made a vow to Neptune in a dangerous tempest, that if he

escaped from the fury of the seas and storms, he would offer to the god whatever living creature first presented itself to his eye on the Cretan shore. This was no other than his son, who came to congratulate his father upon his safe return. Idomeneus performed his promise to the god; and the inhumanity and rashness of this sacrifice rendered him so odious in the eyes of his subjects, that he left Crete, and migrated in quest of a settlement. He came to Italy, and founded a city on the coast of Calabria, which he called *Salenum*. He died in extreme old age, after he had had the satisfaction of seeing his new kingdom flourish and his subjects happy. According to the Greek scholiast of Lycophron, v. 1217, Idomeneus, during his absence in the Trojan war, intrusted the management of his kingdom to Leucos, to whom he promised his daughter Clisithere in marriage at his return. Leucos at first governed with moderation, but he was persuaded by Nauplius king of Eubœa to put to death Meda the wife of his master, with her daughter Clisithere, and to seize the kingdom. After these violent measures he strengthened himself on the throne of Crete, and Idomeneus at his return found it impossible to expel the usurper.

IDUMÆA. See EDOM.

JEALOUSY, in *Ethics*, is that peculiar uneasiness which arises from the fear that some rival may rob us of the affection of one whom we greatly love, or suspicion that he has already done it. The first sort of jealousy is inseparable from love, before it is in possession of its object; the latter is often unjust, generally mischievous, always troublesome.

Waters of JEALOUSY. See WATERS.

IDYLLION, in ancient poetry, is only a diminutive of the word EIDOS, and properly signifies any poem of moderate extent, without considering the subject. But as the collection of Theocritus's poems were called *Idyllia*, and the pastoral pieces being by far the best in that collection, the term *Idyllion* seems to be now appropriated to pastoral pieces.

JEARS or GEERS, in the sea language, an assemblage of tackles, by which the lower yards of a ship are hoisted along the mast to their usual station, or lowered from thence as occasion requires: the former of which operations is called *swaying*, and the latter *striking*.

JEBUSÆI, one of the seven ancient peoples of Canaan, descendants of Jebusi, Canaan's son; so warlike and brave, as to have stood their ground, especially in Jebus, afterwards called *Jerusalem*, down to the time of David, Judges i. 21. 1 Sam. v. 6.

JEDBURGH, a parliament town of Scotland, capital of Tiviotdale or Roxburghshire, is situated nearly in the middle of the county, on the banks of the river *Jed*, whence it derives its name. It is well built and populous, and has a good market for corn and cattle. On the west side of the river, near its junction with the Teviot, stand the beautiful ruins of an abbey founded by David I. a part of which ancient pile still serves for a parish church.—Jedburgh is the seat of the sheriff's court and of a presbytery. The population of this town in 1793 was estimated at 2000.

JEDDO, the capital town or city of the islands of Japan, where the emperor resides. It is open on all sides, having neither walls nor ramparts; and the houses,

Idumæa
||
Jeddo.

Jeff. of ma
||
Jeff. eys.

houses are built with earth, and boarded on the outside to prevent the rain from destroying the walls. In every street there is an iron gate, which is shut up in the night; and a kind of customhouse or magazine, to put merchandises in. It is a large place, being nine miles in length and six in breadth, and contains 1,000,000 of inhabitants. A fire happened in 1658, which, in the space of 48 hours, burnt down 100,000 houses, and in which a vast number of inhabitants perished. The emperor's palace and all the rest were reduced to ashes; but they are all rebuilt again. The royal palace is in the middle of the town; and is defended with walls, ditches, towers, and bastions. Where the emperor resides, there are three towers nine stories high, each covered with plates of gold; and the hall of audience is said to be supported by pillars of massy gold. Near the palace are several others, where the relations of the emperor live. The empress has a palace of her own, and there are 20 small ones for the concubines. Besides, all the vassal kings have each a palace in the city, with a handsome garden, and stables for 2000 horses. The houses of the common sort are nothing but a ground floor, and the rooms are parted by folding screens; so that they can make the rooms larger or smaller at pleasure. It is seated in an agreeable plain, at the bottom of a fine bay; and the river which crosses it, is divided into several canals. E. Long. 140. 0. N. Lat. 35. 32.

JEFFERSONIA, in *Botany*, a genus of plants belonging to the class pentandria, and order *monogynia*. The calyx is composed of five short oval imbricated leaves; the corolla is monophyllous and funnel-shaped; the margin hypocrateriform; the stigma is quadrifid. One species only has been discovered, *simpervirens*, which is a shrub with round, polished, shining stems, which climb on bushes and small trees. This shrub is very abundant in the woods of Georgia in North America, where it was discovered by Dr Brickel, and it is covered with blossoms for many months of the year.

JEFFERY. See GEOFFREY.

JEFFREYS, SIR GEORGE, Baron Wem, commonly called *Judge Jeffreys*, was the sixth son of John Jeffreys, Esq. of Acton in Denbighshire; and was educated at Westminster school, whence he removed to the Inner Temple, where he applied himself to the study of the law. Alderman Jeffreys, who was probably related to him, introduced him among the citizens of London, and he being a merry bottle companion, soon came into great business, and was chosen their recorder. He was afterwards chosen solicitor to the duke of York; and in 1680 was knighted, and made chief-justice of Chester. At length, resigning the recordership, he obtained the post of chief-justice of the king's bench, and, soon after the accession of James II. the great seal. During the reign of King Charles II. he showed himself a bitter enemy to those dissenting ministers who, in that time of persecution, were tried by him: he was one of the greatest advisers and promoters of all the oppressions and arbitrary measures carried on in the reign of James II.; and his sanguinary and inhuman proceedings against Monmouth's unhappy adherents in the west will ever render his name infamous. Whenever the prisoner was of a different party, or he could please the court by condemning him,

instead of appearing, according to the duty of his office, as his counsel, he would scarce allow him to speak for himself; but would load him with the grossest and most vulgar abuses, browbeat, insult, and turn to ridicule the witnesses that spoke in his behalf; and even threaten the jury with fines and imprisonment, if they made the least hesitation about bringing in the prisoner guilty. Yet it is said, that when he was in temper, and matters perfectly indifferent came before him, no one became a seat of justice better. Nay, it even appears, that, when he was under no state influence, he was sometimes inclined to protect the natural and civil rights of mankind, of which the following instance has been given:—The mayor and aldermen of Bristol had been used to transport convicted criminals to the American plantations, and sell them by way of trade. This turning to good account when any pilferers or petty rogues were brought before them, they threatened them with hanging; and then some officers who attended, earnestly persuaded the ignorant intimidated creatures to beg for transportation, as the only way to save them; and in general their advice was followed. Then, without more form, each alderman in course took one, and sold him for his own benefit; and sometimes warm disputes arose between them about the next turn. This infamous trade which had been carried on many years, coming to the knowledge of the lord chief justice, he made the mayor descend from the bench and stand at the bar, in his scarlet and fur, with his guilty brethren the aldermen, and plead as common criminals. He then obliged them to give securities to answer informations; but the proceedings were stopped by the Revolution.—However, the brutality Jeffreys commonly showed on the bench, where his voice and visage were equally terrible, at length exposed him to a severe mortification. A scrivener of Wapping having a cause before him, one of the opposite's counsel said he was a strange fellow, and sometimes went to church, and sometimes to conventicles; and it was thought he was a trimmer. At this the chancellor fired: "A trimmer?" (said he); I have heard much of that monster, but never saw one. Come forth Mr Trimmer, and let me see your shape." He then treated the poor fellow so roughly, that, on his leaving the hall, he declared he would not undergo the terrors of that man's face again to save his life, and he should certainly retain the frightful impressions of it as long as he lived. Soon after, the prince of Orange coming, the lord chancellor, dreading the public resentment, disguised himself in a seaman's dress, in order to leave the kingdom; and was drinking in a cellar, when this scrivener coming into the cellar, and seeing again the face which had filled him with such horror, started; on which Jeffreys, fearing he was known, feigned a cough, and turned to the wall with his pot of beer in his hand. But Mr Trimmer going out, gave notice that he was there: and the mob rushing in seized him, and carried him before the lord mayor, who sent him with a strong guard to the lords of the council, by whom he was committed to the Tower, where he died in 1689.—It is remarkable, that the late countess of Pomfret met with very rude insults from the populace on the western road, only because she was granddaughter to the inhuman Jeffreys.

Jeffreys.

Jehovah
||
Jenifa.

JEHOVAH, one of the Scripture names of God, signifying the Being who is self-existent and gives existence to others.

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They call it *tetragrammaton*, or "the name with four letters; and believe, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJUNE STYLE. See **STYLE**.

JEJUNUM, the second of the small guts; thus called from the Latin *jejunus*, "hungry," because always found empty. See **ANATOMY**, N° 93.

JELLALÆAN, or **GALALÆAN** *Calendar, Epochæ, and Year.* See **CALENDAR**, **EPOCHÆ**, and **YEAR**.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper consistence with sugar; or the strong decoctions of the horns, bones, or extremities of animals, boiled to such a height as to be stiff and firm when cold, without the addition of any sugar.—The jellies of fruits are cooling, saponaceous, and acescent, and therefore are good as medicines in all disorders of the primæ viæ, arising from alkalescent juices, especially when not given alone, but diluted with water. On the contrary, the jellies made from animal substances are all alkalescent, and are therefore good in all cases in which an acidity of the humours prevails: the alkalescent quality of these is, however, in a great measure taken off, by adding lemon juice and sugar to them. There were formerly a sort of jellies much in use, called *compound jellies*; these had the restorative medicinal drugs added to them, but they are now scarce ever heard off.

Jelly-Oat, a preparation of common oats, recommended by many of the German physicians in all hectic disorders, to be taken with broth of snails or cray fish.—It is made by boiling a large quantity of oats, with the husk taken off, with some hartshorn shavings, and currants, together with a leg of veal cut to pieces, and with the bones all broken; these are to be set over the fire with a large quantity of water, till the whole is reduced to a sort of jelly; which when strained and cold will be very firm and hard. A few spoonfuls of this are to be taken every morning, diluted with a basin of either of the above mentioned broths, or any other warm liquor.

JEMPTERLAND, a province of Sweden, bounded on the north by Angermania, on the east by Medalpadia, on the south by Helsingia, and on the west by Norway. It is full of mountains; and the principal towns are Reslundt, Lich, and Docra.

JENA, a strong town of Germany, in the circle of Upper Saxony, and in Thuringia, with an university. It is seated on the river Sala, in E. Long. 12. 4. N. Lat. 51. 0.

JENCAPORE, a town of Asia, in Indostan, and in the dominions of the Great Mogul, capital of a territory of the same name. It is seated on the river Chaul, in E. Long. 76. 25. N. Lat. 30. 30.

JENCOPING, a town of Sweden, in the province of Smaland, seated on the south side of the lake Werter, with a strong citadel. The houses are all built with wood. E. Long. 14. 20. N. Lat. 57. 22.

JENISA, a river of the Russian empire that runs

from north to south through Siberia, and falls into the Frozen ocean.

JENISKOI, a town of the Russian empire, in Siberia, seated on the river Jenifa. It is large, populous, and pretty strong; and there are villages for several miles round it. It is subject to the Tungusians, who are Pagans, and live chiefly on the above river. They pay a tribute to the emperor for every bow, reckoning a man and a woman for one. The climate is extremely cold; and no other fruits grow there but black and red currants, strawberries, and gooseberries. Corn, butchers meat, and wild fowls, are very cheap. E. Long. 92. 35. N. Lat. 57. 46.

JENKINS, HENRY. See **LONGEVITY**.

JENKINS, Sir Leoline, a learned civilian and able statesman of the 17th century, born in Glamorganshire about the year 1623. Being rendered obnoxious to the parliament during the civil war by adhering to the king's cause, he consulted his safety by flight; but returning on the Restoration, he was admitted an advocate in the court of arches, and succeeded Dr Exton as judge. When the queen mother Henrietta died in 1669 at Paris, her whole estate, real and personal, was claimed by her nephew Louis XIV.: upon which Dr Jenkins's opinion being called for and approved, he went to Paris, with three others joined with him in a commission, and recovered her effects; for which he received the honour of knighthood. He officiated as one of the mediators at the treaty of Nimeguen, in which tedious negotiation he was engaged about four years and a half; and was afterwards made a privy counsellor and secretary of state. He died in 1685; and as he never married, bequeathed his whole estate to charitable uses: he was so great a benefactor to Jesus College, Oxford, that he is generally looked on as the second founder. All his letters and papers were collected and printed in 1724, in two vols. folio.

JENNY WREN, a name given by writers on song birds to the wren. See **WREN**, **ORNITHOLOGY** *Index*.

JENTACULUM was, among the Romans, a morning refreshment like our breakfast. It was exceedingly simple, consisting, for the most part, of bread alone; labouring people indeed had something more substantial to enable them to support the fatigues of their employment. What has been here said may be observed of the Jews and Christians also. The Greeks distinguished this morning meal by the several names of *αριστον*, *αρχαλισμα* or *αρχαλισμα*, though *αριστον* is generally applied to dinner. See **EATING** and **DINNER**.

JENYNS, SOAME, a distinguished English writer, was born in Great Ormond-street, London, in the year 1703-4. Sir Roger Jenyns, his father, was descended from the family of the Jenyns of Churchill in Somersetshire. The country residence of Sir Roger was at Ely, in the isle of the same name, where he turned his attention to such kinds of business as rendered him most beneficial to his neighbours, for which amiable deportment in particular the honour of knighthood was conferred upon him by William III. Our author's mother, a lady of rank, learning and piety, superintended his education till it was necessary to place him under a tutor, for which purpose a Mr Hill was taken into the family, by whom he was instructed in the first rudiments of language, with such other branches of knowledge as were suited to his years. At this time Mr

Jeniskoi
||
Jenyns.

Jenyns.

Hill was called to a situation more advantageous, and a Mr White succeeded him in the office of tutor to young Jenyns, a man eminent for his learning, taste, and ingenuity, by whom he was qualified for attending the university.

He was admitted into St John's College, Cambridge, in the year 1722, under Dr Edmondson, who was at that time one of the leading tutors of the college. Here his diligence and regular deportment did him the greatest honour, and the strict discipline observed in the college was perfectly agreeable to his natural inclinations. After quitting the college, his winter residence was in London, and he lived in the country during the summer season, being chiefly employed in the prosecution of such studies as were of a literary nature. His first publication, a poetical essay on the art of dancing, appeared without his name in 1727; but he was very soon discovered, and it was considered as a preface of his future eminence.

Soon after the death of his father, he was chosen in 1742 one of the members of parliament for the county of Cambridge, and from this period he retained his seat in the house of commons till the year 1780. The high opinion entertained by his constituents of his parliamentary conduct, may be learned from the unanimity of their choice; for he never but once experienced any opposition. He was chosen one of the commissioners of the board of trade and plantations in 1755, which office he retained till an alteration was made in the constitution of it by authority of parliament. He was married, first to the only daughter of Colonel Soame, of Dereham in Norfolk, who died without issue, and afterwards to the daughter of Henry Gray, Esq. of Hackney, who survived him. He died himself of a fever, after a few days illness, on the 18th of December, 1787, leaving no issue.

His temper was mild, sweet, and gentle, which he manifested indiscriminately to all. It was his earnest wish never to give offence to any; yet he made such liberal allowances for diversities of temper, that he was very rarely offended with others. He was punctual in the discharge of the duties of religion both in public and private, professing to be better pleased with the government and discipline of the church of England than of any other in Christendom, which, however, he considered as capable of important alterations and amendments, if it were previously and deliberately determined what these alterations should be. He possessed an uncommon vein of the most lively and genuine wit, which he never made use of to wound the feelings of others, but was rather very much offended with those who did, being convinced that distinguished endowments of the mind are as much intended to promote the felicity of others, as of those who possess them.

No man was ever a more genuine philanthropist, as he felt most sensibly for the miseries of others, and used every mean in his power to render them as happy as possible. His indigent neighbours in the country he viewed as a part of his family, in which light he considered them as entitled to his care and protection. As an author, Soame Jenyns certainly deserves a place among those who have excelled, whether we view him as a poet, or a writer of prose, in which latter capacity he ranks with the purest and most correct writers of the English language. He reasons with closeness and pre-

cision, and comes to the conclusion he means to establish by a regular chain of argument. His first publication on account of which he was attacked, was his Free Inquiry into the Nature and Origin of Evil; but in a preface to the second edition he fully vindicated it against all the calumny, slander, and misrepresentation which had been thrown out against it, with that temper and moderation which distinguished him so eminently upon all occasions. His view of the Internal Evidences of the Christian Religion was published without his name in the year 1776, which gave delight and satisfaction to many eminent judges, and made converts of numbers who had been infidels before.

JEOFAILE, (compounded of three French words, *J'ay faille*, "I have failed"), a term in law, used for an oversight in pleading or other proceeding at law.

The showing of these defects or oversights was formerly often practised by the counsel; and when the jury came into court in order to try the issue, they said, This inquest you ought not to take; and after verdict they would say to the court, To judgment you ought not to go. But several statutes have been made to avoid the delays occasioned by such suggestions; and a judgment is not to be stayed after verdict for mistaking the Christian or surname of either of the parties, or in a sum of money, or in the day, month, year, &c. where the same are rightly named in any preceding record.

JEPHTHAH, judge of Israel, and successor to Jair in the government of the people, was a native of Mizpeh, and the son of one Gilead by a harlot. This Gilead having married a lawful wife, and had children by her, these children drove Jephthah from his father's house, saying that he should not be heir with them. Jephthah retired into the land of Tob, and there he became captain of a band of thieves and such other people as he had picked up together. At that time, the Israelites beyond Jordan, seeing themselves pressed by the Ammonites, came to desire assistance from Jephthah; and that he would take upon him the command of them. Jephthah at first reproached them with the injustice which they had done him, or at least which they had not prevented, when he was forced from his father's house. But as these people were very earnest in their request, he told them, that he would succour them, provided that at the end of the war they would acknowledge him for their prince. This they consented to, and promised with an oath.

Jephthah, in the year of the world 2817, having been acknowledged prince of the Israelites in an assembly of the people, was filled with the spirit of God, and began to get his troops together; to that end, he went over all the land which the children of Israel possessed beyond Jordan. At the same time he made a vow to the Lord, that if he were successful against the Ammonites, he would offer up for a burnt-offering whatever should first come out of his house to meet him. The battle being fought, Jephthah remained conqueror, and ravaged all the land of Ammon. But as he returned to his house, his only daughter came out to meet him with timbrels and with dances: whereupon Jephthah tore his clothes, and said, "Alas, my daughter, thou hast brought me very low, for I have made a vow unto the Lord, and cannot fail in the performance of it." His daughter answered, "My father,

Jephaie,
Jephthah.

Jephthah
II
Jephthah.

ther, if thou hast made a vow unto the Lord, do with me as thou hast promised; grant me only the favour that I may be at liberty to go up to the mountains, and there for two months bewail my virginity with my companions." Jephthah granted her this liberty; and at the end of two months, he offered up his daughter, who died a virgin, a burnt-offering, agreeable to his vow, according to the opinion of most commentators. In the mean time, the Ephraimites, jealous of the victory obtained by Jephthah over the Ammonites, passed the river Jordan in a tumultuous manner, came and complained to Jephthah that he had not invited them to this war, and threatened to set fire to his house. Jephthah answered them, that he had sent to desire their assistance; but observing that they did not come, he put his life in his hands and hazarded a battle. The Ephraimites not being satisfied with these reasons, Jephthah assembled the people of Gilead, gave them battle, and defeated them; so that there were two and forty thousand men of the tribe of Ephraim killed that day. We know nothing more in particular concerning the life of Jephthah, only that he judged Israel six years, and was buried in a city of Gilead.

St Paul (Heb. xi. 32.) places Jephthah among the saints of the Old Testament, the merit of whose faith distinguished them. But it must be observed, that there is something so extraordinary in Jephthah's vow, that notwithstanding the Scripture speaks of it in very plain and clear terms, yet such difficulties arise concerning it as perplex commentators. Some maintain, that this daughter of Jephthah was not sacrificed, as that would have been a violation of the law of Moses; and especially, when by the same law he might have redeemed his daughter for ten shekels of silver: therefore they contend, that it was something else Jephthah did to his daughter, such as devoting her to a state of celibacy, or dedicating her to the service of God. On the other hand, those who maintain the affirmative, or that Jephthah's daughter was actually sacrificed, urge, that the times wherein Jephthah lived were sadly addicted to idolatry; also the manner wherein he lived before he was called to the assistance of his country; but above all, the clear, evident, and express meaning of the text. They observe, that vows of perpetual virginity are institutions of a modern date; and had there been no more in it, there would have been little occasion for rending his clothes, and bemoaning himself as he did; besides the bitter lamentations made by herself, and by all the daughters of Israel in succeeding times. But if she was sacrificed, we may safely and confidently aver with Josephus, who says that she was, that this sacrifice was neither lawful nor acceptable to God; but, on the contrary, an abominable crime, that might, notwithstanding, have proceeded from a mistaken principle of religion.

JERBOA, a species of quadruped belonging to the genus *dipus*, and resembling in some of its characters, the mouse tribe. See DIPUS, MAMMALIA Index.

JEREMIAH (*the Prophecy of*), a canonical book of the Old Testament. This divine writer was of the race of the priests, the son of Hilkiah of Anathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13th year of Josiah, and continued in the discharge of it about 40 years. He was not carried captive to Babylon with the other

Jews, but remained in Judea to lament the desolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers tell us he was stoned to death by the Jews, for preaching against their idolatry; and some say he was put to death by Pharaoh Hophrah, because of his prophecy against him. Part of the prophecy of Jeremiah relates to the time after the captivity of Israel, and before that of Judah, from the first chapter to the 44th; and part of it was in the time of the latter captivity, from the 44th chapter to the end. The prophet lays open the sins of Judah with great freedom and boldness, and reminds them of the severe judgments which had befallen the ten tribes for the same offences. He passionately laments their misfortune, and recommends a speedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the 70 years captivity in Chaldea. He likewise foretels their deliverance and happy return, and the recompense which Babylon, Moab, and other enemies of the Jews, should meet with in due time. There are likewise several intimations in this prophecy concerning the kingdom of the Messiah; also several remarkable visions, and types, and historical passages relating to those times. The 52d chapter does not belong to the prophecy of Jeremiah, but probably was added by Ezra, and contains a narrative of the taking of Jerusalem, and of what happened during the captivity of the Jews, to the death of Jechonias. St Jerome has observed upon this prophet, that his style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is very learned and majestic, and equal to those two prophets in the sense of his prophecies.

JERICHO, or HIERICHUS, in *Ancient Geography*, a city of Judea; situated between Jordan and Jerusalem, at the distance of 150 stadia from the latter, and 60 from the former. Josephus says, "the whole space from Jerusalem is desert and rocky, and equally barren and uncultivated from Jericho to the lake Asphaltites; yet the places near the town and above it are extremely fertile and delicious, so that it may be justly called a *divine plain*, surpassing the rest of the land of Canaan, no unfruitful country, and surrounded by hills in the manner of an amphitheatre. It produces opobalsamum, myrobalans, and dates; from the last of which it is called the *city of palm trees*, by Moses. The place is now called *Raha*; and is situated, M. Volney informs us, "in a plain six or seven leagues long, by three wide, around which are a number of barren mountains, that render it extremely hot. Here formerly was cultivated the balm of Mecca. From the description of the Hadjes, this is a shrub similar to the pomegranate tree, with leaves like those of rue: it bears a pulpy nut, in which is contained a kernel that yields the resinous juice we call *balm* or *balsam*. At present there is not a plant of it remaining at Raha; but another species is to be found there, called *zakkoun*, which produces a sweet oil, also celebrated for healing wounds. This zakkoun resembles a plum-tree; it has thorns four inches long, with leaves like those of the olive tree, but narrower and greener, and prickly at the end; its fruit is a kind of acorn, with-

Jerimoth.
Jerome.

out a calyx, under the bark of which is a pulp, and then a nut, the kernel of which gives an oil that the Arabs sell very dear; this is the sole commerce of Raha, which is no more than a ruinous village.

JERIMOTH. See JARIMUTH.

JEROME, St., in Latin *Hieronymus*, a famous doctor of the church, and the most learned of all the Latin fathers, was the son of Eusebius; and was born at Stridon, a city of the ancient Pannonia, about the year 340. He studied at Rome under Donatus, the learned grammarian. After having received baptism, he went into Gaul, and there transcribed St Hilary's book *de Synoia*. He then went into Aquileia, where he contracted a friendship with Heliodorus, who prevailed on him to travel with him into Thrace, Pontus, Bithynia, Galatia, and Cappadocia. In 372 St Jerome retired into a desert in Syria, where he was persecuted by the orthodox of Melitius's party, for being a Sabelian, because he made use of the word *Hypostasis*, which had been used by the council of Rome in 369. This obliged him to go to Jerusalem; where he applied himself to the study of the Hebrew language, in order to receive a more perfect knowledge of the Holy Scriptures; and about this time he consented to be ordained, on condition that he should not be confined to any particular church. In 381, he went to Constantinople to hear St Gregory of Nazianzen; and the following year returned to Rome, where he was made secretary to Pope Damasus. He then instructed many Roman ladies in piety and the knowledge of the sciences, which exposed him to the calumnies of those whom he zealously reprobated for their irregularities; and Pope Siricius not having all the esteem for him which his learning and virtue justly entitled him to, this learned doctor left Rome, and returned to the monastery of Bethlehem, where he employed himself in writing against those whom he called *heretics*, especially against Vigilantius and Jovinian. He had a quarrel with John of Jerusalem and Rufinus about the Origenists. He was the first who wrote against Pelagius; and died on the 30th of September 420, at about 80 years of age. There have been several editions of his works; the last, which is that of Verona, is in 11 vols. folio. His principal works are, 1. A Latin version of the Holy Scriptures, distinguished by the name of the *Vulgate*. 2. Commentaries on the Prophets, Ecclesiastes, St Matthew's Gospel, and the Epistles to the Galatians, Ephesians, Titus, and Philemon. 3. Polemical treatises against Montanus, Helvidius, Jovinian, Vigilantius, and Pelagius. 4. Several letters. 5. A treatise on the lives and writings of the ecclesiastical authors who had flourished before his time.—St Jerome's style is lively and animated, and sometimes sublime.

JEROME of Prague, so called from the place of his birth, in Bohemia. He was neither a monk nor clergyman, but had a learned education. Having embraced the opinions of John Hufs, he began to propagate them in the year 1480. In the mean time the council of Nice kept a watchful eye over him, and considering him as a dangerous person, cited him to appear before them and give an account of his faith. In obedience to this citation, he went to Constance; but on his arrival, in 1415, finding Hufs in prison, he set out for his own country. Being seized, however, on the way, imprisoned, and examined, he was so in-

timidated, that he retracted, and pretended to approve of the condemnation of Wickliff's and Hufs's opinions; but on the 26th of May 1416, he condemned that recantation in these terms: "I am not ashamed to confess here publicly my weakness. Yes, with horror I confess my base cowardice. It was only the dread of the punishment by fire which drew me to consent, against my conscience, and to the condemnation of the doctrine of Wickliff and Hufs." Accordingly sentence was passed on him; in pursuance of which he was delivered to the secular arm, and burnt in 1416. He was a person of great parts, learning, and elocution.

JERONYMITES, or HIERONYMITES, a denomination given to divers orders or congregations of religious; otherwise called *Hermits of St Jerome*.

JERSEY, an island in the English channel, believed to be the island called in the Itinerary *Cæsarea*, in succeeding times *Augia*, by us *Gersey*, more frequently *Jersey*. It is situated in the English channel, 18 miles to the west of Normandy, and 84 to the south of Portland in Dorsetshire, and in the time of the Romans was called *Cæsarea*. It is not above 12 miles in length, nor much above 6 where broadest, which is at the two extremities. It is defended by rocks and dangerous quicksands. On the north side the cliffs rise 40 or 50 fathoms high, which render it inaccessible on that side; but on the south the shore is almost level with the water. In the west part of the island is a large tract of land once cultivated and very fertile, but now a barren desert, caused by the westerly winds throwing up sand from the bottom to the top of the highest cliffs. The higher lands are diversified by gritty, gravelly, stony, and fine mould; the lower by a deep, rich, and heavy soil. The middle part of the island is somewhat mountainous, and so thick planted with trees, that at a distance it resembles one entire forest, though in walking through it there is hardly a thicket or any other thing to be seen but hedge-rows and orchards of apple-trees. The valleys under the hills are finely watered by brooks, and have plenty of cattle and small sheep, with very fine wool, and very sweet meat, which is ascribed to the shortness of the grass. The horses are good for draught; but few fit for the saddle. The island produces variety of trees, roots, and herbs; but not corn enough for the inhabitants, who therefore send for it to England and France, and sometimes to Dantzic. The fields are inclosed by great mounds of earth, raised from 6 to 8 or 10 feet high, proportionably thick and solid, planted with quicksets and trees. As the air of this island is very healthy, those of the inhabitants who are temperate live to a great age: but the coast is very subject to storms by westerly winds, from which they have no land to shelter them nearer than North America; and there is a vast chain of rocks about the island, among which the tides and currents are so strong and rapid, that the navigation is dangerous to those who are not perfectly acquainted with the coast. The buildings of this island are generally of rag stone; but some of the wealthy inhabitants have their houses fronted with a reddish white stone, capable of being polished like marble, and of which there is a rich quarry on a hill called *Montmado*. The ordinary dwellings are thatched. The churches are very plain buildings, most of them with square steeples; and the communion

Jerony-
mites,
Jersey.

Jersey. munion table is not at the east end, as in the English churches, but placed just under the pulpit. The staple manufacture is knit stockings and caps, many thousand pairs of which are weekly sold at St Helier to the merchants; also cyder, of which 25,000 hogsheds have been made here in one year. Their principal foreign trade is to Newfoundland; whither, particularly in 1732, they sent 24 ships; these proceed from thence to the Mediterranean to dispose of their fish.

On the south of the island the sea seems to have encroached upon the land (which, as we have before observed, declines on that side), and to have swallowed upwards of six square miles, making a very beautiful bay of about three miles long, and near the same in breadth. In the east corner of this bay stands the town of St Helier, very happily situated. But the principal haven is in the western corner of the bay, which receives its name from it, being called *St Aubin's*. There are, besides these, several other havens of less note; as, St Brelade's bay, at the back of St Aubin's; the great bay of St Ouen, which takes in the greatest part of the west side of the island, where the largest ships may ride in 12 and 15 fathoms, safe from all but east winds. La Crevasse is a port only for boats; Greve de Lecq and Port St John are also small havens on the north side, where is likewise Bonneauit. On the east there is the bay of St Catharine, and the harbour of Rosel. To the south-west lies the haven de la Chaussée. The last we shall mention is the port de Pas, a very little to the eastward of St Aubin's bay.

The towns of St Helier and St Aubin, which, as already mentioned, stand both in the same bay called *St Aubin's bay*, opening to the south, are about three miles asunder. St Helier took its name from *Elerius* or *Helier*, a holy man, who lived in this island many centuries ago, and was slain by the Pagan Normans at their coming hither. He is mentioned among the martyrs in the martyrology of Coutance. His little cell with the stone bed is still shown among the rocks; and in memory of him a noble abbey of canons regular was founded in the little island in this bay, and annexed to Cherburg abbey in Normandy in the reign of Henry I. and suppressed as an alien priory. The town of St Helier stands at the foot of a long and high rocky hill at the east end. It is a well-built and populous place; greatly improved and enlarged within the last century; and contains about 400 houses, mostly shops, and near 2000 inhabitants. The market-place in the centre is spacious, surrounded with handsome houses, among which is the Cohue-Royale or court of justice. At the top of the market-place is a statue of George II. of bronze gilt. The market is held on a Saturday, and much frequented.

St Aubin at the west end of the bay is principally inhabited by merchants and masters of ships, whom the neighbourhood of the port has invited hither. It is not more than half the size of the other town, though greatly increased within these 100 years; and has a good stone pier carried far into the sea, where ships of considerable burden lie safe under the guns of the adjoining fort.

The isle of St Helier, more to the east in the same bay, is in circuit near a mile, surrounded by the sea at

or about every half flood. On the site of the abbey before mentioned is now Elizabeth castle, one of the largest and strongest fortresses in Britain. Queen Elizabeth began it, and gave it her name. Charles I. enlarged it, and Charles II. who was twice here, completed it. It was the last fortress that held out for the king. It is the residence of the governor and garrison, and occupies the whole isle, from whence at low water is a passage called the *bridge*, half a mile long, formed of sand and stones. A citadel was begun in the last war on a hill, whence the castle might be bombarded, but since the peace left off.

Mount Orgueil castle, called also *Gourray* from the neighbouring village of that name, lies to the south of Rosel harbour in the bay of St Catharine. It was a place of strength before Henry V.'s time, and bid defiance to the attempts of the French under the constable De Guesclin 1374 at the end of the reign of Edward III. It was repaired by Queen Elizabeth, but is now neglected, yet preserves an air of grandeur answering its name even in ruins. The ascent to its top is by near 200 steps; and from thence by a telescope may be seen the two front towers of the cathedral of Coutance. The famous William Prynne was confined in it three years.

The island is divided into 12 parishes, which are so laid out that each has a communication with the sea; these are subdivided into 52 vintaines, so called from the number of 20 houses, which each is supposed to have formerly contained, just as in England 10 houses anciently made a tything. The whole number of inhabitants is computed at about 20,000, of which 3000 are able to bear arms, and are formed into regiments. Their general review is on the sandy bay between the two towns, when they are attended with a train of above 20 brass field pieces, and two small bodies of horse in the wings.

The chief officer is the governor, who has the custody of his majesty's castles, with the command of the garrisons and militia. The civil government is administered by a bailiff, assisted by 12 jurats. They have here also what they call an assembly of the states. These are convened by the governor or his deputy; the bailiff consists of himself and the jurats, the dean and clergy, and the 12 high constables.

There were formerly many druidical temples and altars in Jersey, some remains of which are still to be seen. The cromlichs are here called *pouquelays*, and there are some tumuli and keeps. Roman coins have also been dug up in this island; and there are the remains of a Roman camp in the manor of Dilamant. Christianity was first planted here in the middle of the 6th century, and the island made part of the see of Dol in Bretagne, and it is now governed by a dean. Besides the abbey of St Helier, here were four priories, *Noirmont*, *St Clement*, *Bonnenuit*, and *le Leck*, and above 20 chapels, now mostly ruined. During the last war this island, together with that of Guernsey, became an object of desire to France, whose vanity, no less than her interest, was concerned in depriving Britain of those last remnants of her continental possessions. The first attempt to achieve this conquest took place in the year 1779. A force of 5000 or 6000 men was embarked in flat-bottomed boats, and endeavoured to land in the bay of St Ouen, on the first of May. In
this.

Jersey.

this attempt they were supported by five frigates and other armed vessels; but met with such a vigorous resistance from the militia of the island, assisted by a body of regulars, that they were compelled to retire without having landed a single person. Much discontent and mutual recrimination took place among the French naval and military officers on this failure; and though the expedition was represented by many as ill concerted, and destitute of every hope of success, another attempt was resolved on. Both the troops and seamen that had been employed in the former expedition were equally desirous of retrieving their honour; but they were for some time prevented from making any attempt of this kind by bad weather; and, before another opportunity offered, the squadron which was designed to cover their descent was attacked by Sir James Wallace, who drove them ashore on the coast of Normandy, silenced a battery under whose guns they had taken shelter, captured a frigate of 34 guns, with two rich prizes, burnt two other large frigates, and a considerable number of smaller vessels.

Thus the scheme of invading the island of Jersey was totally disconcerted, and laid aside for that time, but was resumed in the year 1781. The conduct of this second expedition was given to the baron de Rullecourt, who had been second in command when the former attempt was made. He was a man of courage, but fierce and violent in his disposition, and seems to have been very deficient in the prudence and conduct necessary for bringing any military enterprise to a successful issue. The force entrusted to him on the present occasion consisted of 2000 men; with whom he embarked in very tempestuous weather, hoping that he might thus be able to surprise the garrison. Many of his transports, however, were thus dispersed, and he himself, with the remainder, obliged to take shelter in some islands in the neighbourhood of Jersey. As soon as the weather grew calmer, he seized the opportunity of a dark night to effect landing at a place called Grouville, where he made prisoners of a party of militia. Hence he proceeded with the utmost expedition to St Helier's, the capital of the island, about three miles distant. His arrival was so unexpected, that he seized on a party of men who guarded it, together with the commanding officer, and the magistrates of the island. Rullecourt then drew up a capitulation, the terms of which were, that the island should be instantly surrendered to the French, and the garrison be sent to England; threatening the town with immediate destruction in case of non-compliance. It was in vain represented to him that no act of the deputy-governor and magistrates could be valid while they remained in his power; but, as Rullecourt still insisted, they were obliged to comply, lest his menaces should have been carried into execution. This point being gained, he advanced to Elizabeth castle in the neighbourhood of the town, summoning it to surrender in virtue of the capitulation for the town and island just concluded. To this a peremptory refusal was given, and followed by such a vigorous discharge of artillery, that he was obliged to retire into the town. In the mean time the British troops stationed in the island began to assemble from every quarter under the command of Major Pierfon; who, on being required by the French commander to submit, replied, that if the French themselves did not,

within 20 minutes, lay down their arms, he would attack them. This being refused, an attack was instantly made with such impetuosity, that the French were totally routed in less than half an hour, and driven into the market-place, where they endeavoured to make a stand. Their commander, exasperated at this unexpected turn of affairs, endeavoured to wreak his vengeance on the captive governor, whom he obliged to stand by his side during the whole time of the conflict. This, however, was quickly over; the French were broken on all sides, the baron himself mortally wounded, and the next in command obliged to surrender himself and the whole party prisoners of war; while the captive governor escaped without a wound. This second disaster put an end to all hopes of the French ministry of being able to reduce the island of Jersey, and was indeed no small mortification to them; 800 troops having been landed at that time, of which not one escaped. A monument was erected at the public expence in the church of St Helier, to the memory of Major Pierfon, to whom the deliverance of the island was owing; but who unhappily fell in the moment of victory, when only 24 years of age.

All the landing places and creeks round the island are now fortified with batteries, and 17 or 18 watch-houses are erected on the headlands. These are round towers with embrasures for small cannon and loop-holes for small musketry; the entrance by a door in the wall out of the reach of man, and to be ascended by a ladder afterwards drawn up. This island, with those of Guernsey, Sark, Alderney, and their appendages, were parcel of the duchy of Normandy, and were united to the crown of England by the first princes of the Norman line. The language of the pulpit, and the bar, is the French, which is also that generally spoken by the people at large. They are governed by their own laws, which are for the most part the ducal customs of Normandy, being collected in an ancient book of customs intitled *Le grand coutumier*. The king's writ, or process from the courts of Westminster, is here of no force; but his commission is. They are not bound by any common acts of our parliaments, unless particularly named. All causes are originally determined by their own officers, the bailiff and jurats of the islands. But an appeal lies from them to the king and council in the last resort.—Jersey is an earldom in the Villiers family.

NEW JERSEY, or, as it is commonly called, *the Jerseys* (being two provinces united into one government), one of the united states of North America, lying from 39 to 41 degrees of north latitude, and from 74 to 75 degrees 30 minutes longitude west from London; in length 160 miles, in breadth 52.

It is bounded on the east by Hudson's river and the sea; on the south by the sea; on the west by Delaware bay and river, which divide it from the states of Delaware and Pennsylvania; and on the north, by a line drawn from the mouth of Mahakkamak river, in latitude 41° 24', to a point on Hudson's river, in latitude 41°; containing about 8320 square miles, equal to 5,324,800 acres. New Jersey is divided into 13 counties, which are subdivided into 94 townships or precincts. In 1784, a census of the inhabitants was made by order of the legislature, when they amounted to 140,435, of which 10,501 were blacks. Of these blacks

blacks 1939 only were slaves; so that the proportion of slaves to the whole of the inhabitants in the state is as one to 76. The population for every square mile is 18. As to the face of the country, soil, and productions, the counties of Suffex, Morris, and the northern part Bergin, are mountainous. As much as five-eighths of most of the southern counties, or one-fourth of the whole state, is sandy and barren, unfit for cultivation. The land on the sea coast in this, like that in the most southern states, has every appearance of *made ground*. The soil is generally a light sand; and by digging, on an average, about 50 feet below the surface (which can be done, even at the distance of 20 or 30 miles from the sea, without any impediment from rocks or stones), you come to salt marsh. This state has all the varieties of soil from the worst to the best kind. It has a greater proportion of *barrens* than any of the states. The *barrens* produce little else but shrub oaks and white and yellow pines. In the hilly and mountainous parts of the state, which are not too rocky for cultivation, the soil is of a stronger kind, and covered in its natural state with stately oaks, hickories, chestnuts, &c. &c. and, when cultivated, produces wheat, rye, Indian corn, buck wheat, oats, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and the farmers feed great numbers of cattle for New York and Philadelphia markets, and many of them keep large dairies. The markets of New York and Philadelphia receive a very considerable proportion of their supplies from the contiguous parts of New Jersey. And it is worthy of remark that these contiguous parts are exceedingly well calculated, as to the nature and fertility of their soils, to afford these supplies; and the intervention of a great number of navigable rivers and creeks renders it very convenient to market their produce. These supplies consist of vegetables of many kinds, apples, pears, peaches, plums, strawberries, cherries, and other fruits; cyder in large quantities and of the best quality; butter, cheese, beef, pork, mutton, and the lesser meats.

The trade of this state is carried on almost solely with and from those two great commercial cities, New York on one side, and Philadelphia on the other; though it wants not good ports of its own. The articles exported, besides those already mentioned, are wheat, flour, horses, live cattle, hams, which are celebrated as being the best in the world, lumber, flaxseed, leather, and iron in great quantities in pigs and bars. Formerly copper ore was reckoned among their most valuable exports; but the mines have not been worked since the commencement of the late war. The iron manufactures is the greatest source of wealth to the state. Iron works are erected in Gloucester, Burlington, Morris, and other counties. The mountains in the county of Morris give rise to a number of streams necessary and convenient for these works, and at the same time furnish a copious supply of wood and ore of a superior quality. In this county alone are no less than seven rich iron mines, from which might be taken ore sufficient to supply the United States; and to work it into iron are two furnaces, two rolling and slitting mills, and about thirty forges, containing from two to four fires each. These works produce annually about 540 tons of bar iron, 800 tons of pigs

besides large quantities of hollow ware, sheet iron, and nail rods. In the whole state, it is supposed there is yearly made about 1200 tons of bar iron, 1200 do. of pigs, 80 do. of nail rods, exclusive of hollow ware, and various other castings, of which vast quantities are made.

The character, manners, and customs of the people are various in different parts of the state. The inhabitants are a collection of Low Dutch, German, English, Scotch, Irish, and New Englanders, or their descendants. National attachment and mutual convenience have generally induced these several kinds of people to settle together in a body; and in this way their peculiar national manners, customs, and character, are still preserved, especially among the lower class of people, who have little intercourse with any but those of their own nation. Religion, although its tendency is to unite people in those things that are essential to happiness, occasions wide differences as to manners, customs, and even character. The Presbyterian, the Quaker, the Episcopalian, the Baptist, the German and Low Dutch Calvinist, the Methodist, and the Moravian, have each their distinguishing characteristics, either in their worship, their discipline, or their dress. There is still another very perceptible characteristical difference, distinct from either of the others, which arises from the intercourse of the inhabitants with different states. The people in West Jersey trade to Philadelphia, and of course imitate their fashions, and imbibe their manners. The inhabitants of East Jersey trade to New York, and regulate their fashions and manners according to those of New York. So that the difference in regard to fashions and manners between East and West Jersey, is nearly as great as between New York and Philadelphia. The people of New Jersey are generally industrious, frugal, and hospitable. There are, comparatively, but few men of learning in the state, nor can it be said that the people in general have a taste for the sciences. The lower class, in which may be included three-fifths of the inhabitants of the whole state, are ignorant, and are criminally neglectful in the education of their children. There are, in this state, about 50 Presbyterian congregations, subject to the care of three presbyteries, viz. that of New York, of New Brunswick, and Philadelphia; 40 congregations of the Friends; 30 of the Baptists; 25 of Episcopalians; 28 of the Dutch, besides a few Moravians and Methodists.

There are two colleges in New Jersey; one at Princeton, called *Nassau Hall*; the other at Brunswick, called *Queen's-college*. The college at Princeton was first founded about the year 1738, and enlarged by Governor Belcher in 1747. It has an annual income of about 9000. currency; of which 2000. arises from funded public securities and lands, and the rest from the fees of the students. There is a grammar-school of about 30 scholars, connected with the college, under the superintendance of the president, and taught by two masters. Before the late revolution this college was furnished with a philosophical apparatus worth 2000. which (except the elegant orrery constructed by Mr Rittenhouse) was almost entirely destroyed during the war, as was also the library, which now consists of between 2000 and 3000 volumes.—The charter for Queen's-college at Brunswick was granted just before the war, in consequence of an application from a body of the Dutch church,

New Jersey. church. Its funds, raised wholly by free donations, amounted soon after its establishment to 4000l.; but they were considerably diminished by the war. The students are under the care of a president. This college has lately increased both in numbers and reputation. There are also a number of flourishing academies in this state; one at Trenton, another in Hakkensak, others at Orangedale, Freehold, Elizabeth-town, Burlington, Newark, Springfield, Morristown, Bordentown, and Amboy: but there are no regular establishments for common schools. The usual mode of education is for the inhabitants of a village or neighbourhood to join in affording a temporary support for a schoolmaster, upon such terms as is mutually agreeable. But the encouragement which these occasional teachers meet with, is generally such as that no person of abilities adequate to the business will undertake it, and of course little advantage is derived from these schools.

There are a number of towns in this state, nearly of equal size and importance, and none that has more than 200 houses, compactly built.—*Trenton* is the largest town in New Jersey. This town, with *Lamberton*, which joins it on the south, contain 200 houses, and about 1500 inhabitants. Here the legislature meets, the supreme court sits, and the public offices are all kept, except the secretary's, which is at *Burlington*. On these accounts it is considered as the capital of the state.—*Burlington* stands on the east side of the Delaware, 20 miles above Philadelphia by water, and 17 by land. The island, which is the most populous part of the city, is a mile and a quarter in length, and three quarters of a mile in breadth. On the island are 160 houses, 900 white and 100 black inhabitants. There are two houses for public worship in the town, one for the Friends or Quakers, who are the most numerous, and one for the Episcopalians. The other public buildings are two market-houses, a court-house, and the best gaol in the state. Besides these, there is an academy, a free school, a nail manufactory, and an excellent distillery, if that can be called excellent which produces a poison both of health and morals.—*Perth Amboy* stands on a neck of land included between Raritan river and Arthur Kull sound. It lies open to Sandy Hook, and has one of the best harbours on the continent. Vessels from sea may enter it in one tide, in almost any weather.—*Brunswick* was incorporated in 1784, and is situated on the south-west side of Raritan river, 12 miles above Amboy. It contains about 200 houses and 1600 inhabitants, one-half of which are Dutch. Its situation is low and unpleasant, being on the bank of the river, and under a high hill which rises back of the town.—*Princeton* is a pleasant healthy village, of about 80 houses, 52 miles from New York, and 43 from Philadelphia.—*Elizabeth town* and *Newark* are pleasant towns; the former is 15, and the latter nine miles from New York. Newark is famed for its good cyder.

The government of this state is vested in a governor, legislative council, and general assembly. The governor is chosen annually by the council and assembly jointly. The legislative council is composed of one member from each county, chosen annually by the people. The general assembly is composed of three members from each county, chosen by the freemen. The council choose one of their members to be vice-

president, who, when the governor is absent from the state, possesses the supreme executive power. The council may originate any bills, excepting preparing, and altering any money bill, which is the sole prerogative of the assembly.

The first settlers of New Jersey were a number of Dutch emigrants from New York, who came over between the years 1614 and 1620, and settled in the county of Bergen. Next after these, in 1627, came over a colony of Swedes and Finns, and settled on the river Delaware. The Dutch and Swedes, though not in harmony with each other, kept possession of the country many years. In March 1664, Charles II. granted all the territory called by the Dutch *New Netherlands*, to his brother the duke of York. And in June 1664, the duke granted that part now called *New Jersey* to Lord Berkeley of Stratton, and Sir George Carteret, jointly; who, in 1665, agreed upon certain concessions with the people for the government of the province, and appointed Philip Carteret, Esq. their governor.—The Dutch reduced the country in 1672; but it was restored by the peace of Westminster, February 9. 1674.

This state was the seat of war for several years, during the bloody contest between Great Britain and America; and her losses, both of men and property, in proportion to the population and wealth of the state, was greater than of any other of the thirteen states.

JERSEY, among woolcombers, denotes the finest wool, taken from the rest by dressing it with a Jersey comb.

JERUSALEM, a very famous and ancient city, capital of Judea or Palestine, now a province of Turkey in Asia. According to Manetho, an Egyptian historian, it was founded by the shepherds who invaded Egypt in an unknown period of antiquity*. According to Josephus, it was the capital of Melchisedek's kingdom, called *Salem* in the book of Genesis: and the Arabians assert, that it was built in honour of Melchisedek by 12 neighbouring kings; which when they had done, he called it *Jerusalem*. We know nothing of it with certainty, however, till the time of King David, who took it from the Jebusites, and made it the capital of his kingdom, which it ever after continued to be. It was first taken in the days of Jehoash, by Hazael the king of Syria, who slew all the nobility, but did not destroy their city. It was afterwards taken by Nebuchadnezzar king of Babylon, who destroyed it, and carried away the inhabitants. Seventy years after, permission was granted by Cyrus king of Persia to the Jews to rebuild their city, which was done; and it continued the capital of Judea (though frequently suffering much from the Grecian monarchs of Syria and Egypt), till the time of Vespasian emperor of Rome, by whose son Titus it was totally destroyed †. It was, however, rebuilt by Adrian; and seemed likely to have recovered its former grandeur, being surrounded with walls, and adorned with several noble buildings; the Christians also being permitted to settle in it. But this was a short-lived change; so that when the empress Helena, mother of Constantine the Great, came to visit this city, she found it in the most forlorn and ruinous situation. Having formed a design of restoring it to its ancient lustre, she caused, with a great deal

Jersey,
Jerusalem

† See Jru

Jerusalem deal of cost and labour, all the rubbish that had been thrown upon those places where our Saviour had suffered, been buried, &c. to be removed. In doing this, they found the cross on which he died, as well as those of the two malefactors who suffered with him; and, as the writers of those times relate, discovered by a miracle that which had borne the Saviour of mankind. She then caused a magnificent church to be built, which inclosed as many of the scenes of our Saviour's sufferings as could conveniently be done, and adorned the city with several other buildings. The emperor Julian is said to have formed a design of rebuilding the temple of Jerusalem, and of restoring the Jewish worship. This scheme was contrived on purpose to give the lie to our Saviour's prophecy concerning the temple and city of Jerusalem; namely, that the first should be totally destroyed, without one stone being left upon another; and that Jerusalem should be trodden down of the Gentiles till the times of the Gentiles were fulfilled. In this attempt, however, according to the accounts of the Christian writers of that age, the emperor was frustrated by an earthquake and fiery eruption from the earth, which totally destroyed the work, consumed the materials which had been collected, and killed a great number of the workmen.

This event hath been the subject of much dispute. Mr Warburton, who hath published a treatise expressly on the truth of this fact, hath collected the following testimonies in favour of it. The first is that of Ammianus Marcellinus, who tells us, "Julian (having been already thrice consul), taking Sallust, prefect of the several Gauls, for his colleague, entered a fourth time on this high magistracy; and although his sensibility of the many and great events which this year was likely to produce made him very anxious for the future, yet he both pushed on the various and complicated preparatives for this expedition with the utmost application, and having an eye in every quarter, and being desirous to eternize his reign by the greatness of his achievements, he projected to rebuild at an immense expence the proud and magnificent temple of Jerusalem; which (after many combats, attended with much bloodshed on both sides, during the siege by Vespasian) was with great difficulty taken and destroyed by Titus. He committed the conduct of this affair to Alypius of Antioch, who had formerly been lieutenant in Britain. When therefore this Alypius had set himself to the vigorous execution of his charge, in which he had all the assistance that the governor of the province could afford him, horrible balls of fire breaking out near the foundations, with frequent and reiterated attacks, rendered the place from time to time inaccessible to the scorched and blasted workmen; and the victorious element continuing, in this manner, obstinately and resolutely bent, as it were, to drive them to a distance, Alypius thought best to give over the enterprise."

The next testimony is that of Gregory Nazianzen, Speaking of the emperor Julian, he says, "After having run through a course of every other tyrannical experiment against the faith, and upon trial despising all of them as trifling and contemptible, he at last brought down the whole body of the Jews upon us; whom, for their ancient turn to seditious novelties, and an inveterate hatred of the Christian name, he

chose as the fittest instrument for his machinations. Jerusalem. These, under a show of great good-will, which hid his secret purpose, he endeavoured to convince from their sacred books and traditions, which he took upon him to interpret, that now was come the time foretold when they should return to their own land, rebuild their temple, and restore the law to its ancient force and splendor. When these things had been thoroughly insinuated, and heartily entertained (for deceit finds easy admittance when it flatters our passions), the Jews set upon the work of rebuilding with great attention, and pushed on the project with the utmost labour and application. But when, now driven from their work by a violent whirlwind and a sudden earthquake, they fled together for refuge to a certain neighbouring church (some to deprecate the impending mischief; others, as is natural in such cases, to catch at any help that presents itself; and others again, enveloped in the crowd, were carried along with the body of those who fled); there are who say, the church refused them entrance; and that when they came to the doors which were wide open but a moment before, they found them on a sudden closed by a secret and invisible hand; a hand accustomed to work these wonders by the terror and confusion of the impious, and for the security and comfort of godly men. This, however, is now invariably affirmed and believed by all, that as they strove to force their way in by violence, the fire which burst from the foundations of the temple, met and stopped them. One part it burnt and destroyed, and another it desperately maimed, leaving them a living monument of God's commination and wrath against sinners. Thus the affair passed; and, let no man continue incredulous concerning this or the other miraculous works of God. But still the thing most wonderful and illustrious was, a light which appeared in the heavens, of a cross within a circle. That name and figure which impious men before esteemed so dishonourable upon earth, was now raised on high, and equally objected to the common view of all men; advanced by God himself as the trophy of his victory over unbelievers; of all trophies the most exalted and sublime. Nay further, they who were present, and partakers of the miracle we are now about to speak of, shew to this very day the sign or figure of the cross which was then marked or impressed upon their garments. For at that time, as these men (whether such as were of us or strangers) were showing these marks, or attending to others who showed them, each presently observed the wonder, either on himself or his neighbour; having a radiant mark on his body or on his garment, in which there is something that, in art and elegance, exceeded all painting or embroidery."

Notwithstanding these testimonies, however, this fact hath been strenuously contended by others; and indeed it must be owned that the testimonies above mentioned are by no means unexceptionable. In the last, particularly, the propensity to the marvellous is so exceedingly great, that every one must at first sight be struck with it. It is true indeed, the most miraculous part of it, as it seemed to be to Gregory, namely, the appearance of crosses upon the garments and bodies of some of the people who were struck, may be explained upon a natural principle; since we

Jerusalem: are assured that lightning will sometimes produce effects of this kind*: but even this is no decisive proof of the authenticity of the relation; though it cannot by any means discredit it, as some think. On the whole, however, it is not a matter of any consequence whether this event happened with the circumstances above mentioned or not. If Julian did make any attempt to rebuild the temple, it is certain that something obstructed the attempt, because the temple was never actually rebuilt. If he made no such attempt, the prophecy of our Saviour still holds good; and it surely cannot be thought to detract from the merit of a prophecy, that no body ever attempted to elude it, or prove it to be a falsehood.

Jerusalem continued in the hands of the eastern emperors till the reign of the caliph Omar, who reduced it under his subjection. The Saracens continued in possession of it till the year 1099, when it was taken by the Crusaders. They founded a new kingdom, of which Jerusalem was the capital, which lasted 88 years under nine kings. At last this kingdom was utterly ruined by Saladin; and though the Christians once more got possession of the city, they were again obliged to relinquish it. In 1217, the Saracens were expelled by the Turks, who have ever since continued in possession of it.

The city of Jerusalem, in its most flourishing state, was divided into four parts, each inclosed with its own walls; viz. 1. The old city of Jebus, which stood on Mount Zion, where the prophets dwelt, and where David built a magnificent castle and palace, which became the residence both of himself and successors; on which account it was emphatically called *the City of David*. 2. The lower city, called also *the Daughter of Zion*, being built after it; on which stood the two magnificent palaces which Solomon built for himself and his queen; that of the Maccabean princes; and the stately amphitheatre built by Herod, capable of containing 80,000 spectators; the strong citadel, built by Antiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabee, who recovered the city from the Syrians; and lastly, a second citadel, built by Herod, upon a high and craggy rock, and called by him *Antonia*. 3. The new city, mostly inhabited by tradesmen, artificers, and merchants; and, 4. Mount Moriah, on which was built the so famed temple of Solomon, described in the sixth and seventh chapters of the second book of Kings; and, since then, that rebuilt by the Jews on their return from Babylon, and afterwards built almost anew and greatly adorned and enriched by Herod.

Some idea of the magnificence of this temple may be had from the following considerations. 1. That there were no less than 163,300 men employed in the work. 2. That notwithstanding that prodigious number of hands, it took up seven whole years in building. 3. That the height of this building was 120 cubits, or 82 yards, rather more than less; and the courts round it about half as high. 4. That the front, on the east side, was sustained by ramparts of square stone, of vast bulk, and built up from the valley below, which last was 300 cubits high, and being added to that of the edifice amounted to 420 cubits; to which, if we add, 5. The height of the principal tower above all the rest, viz. 60, will bring

it to 480 cubits, which, reckoning at two feet to a cubit, will amount to 960 feet; but according to the length of that measure, as others reckon it, viz. at two feet and an half, it will amount to 1200 feet; a prodigious height this from the ground, and such as might well make Josephus say, that the very design of it was sufficient to have turned the brain of any but Solomon. 6. These ramparts, which were raised in this manner, to fill up the prodigious chasm made by the deep valley below, and to make the area of a sufficient breadth and length for the edifice, were 1000 cubits in length at the bottom, and 800 at the top, and the breadth of them 100 more. 7. The huge buttresses which supported the ramparts were of the same height, square at the top, and 50 cubits broad, and jutted out 150 cubits at the bottom. 8. The stones, of which they were built, were, according to Josephus, 40 cubits long, 12 thick, and 8 high, all of marble, and so exquisitely joined, that they seemed one continued piece, or rather polished rock. 9. According to the same Jewish historian, there were 1453 columns of Parian marble, and twice that number of pilasters; and of such thickness, that three men could hardly embrace them, and their height and capitals proportionable, and of the Corinthian order. But it is likely Josephus hath given us these two last articles from the temple of Herod, there being nothing like them mentioned by the sacred historians, but a great deal about the prodigious cedars of Lebanon used in that noble edifice, the excellent workmanship of them adapted to their several ends and designs, together with their gildings and other curious ornaments. The only thing more we shall venture to add is, what is affirmed in Scripture, that all the materials of this stupendous fabric were finished and adapted to their several ends before they were brought to Jerusalem, that is, the stones in their quarries, and the cedars in Lebanon; so that there was no noise of axe, hammer, or any tool, heard in the rearing of it.

At present Jerusalem is called by the Turks *Cudsembaric*, and *Coudjberiff*; and is reduced to a poor thinly inhabited town, about three miles in circumference, situated on a rocky mountain, surrounded on all sides, except the north, with steep ascents and deep valleys; and these again environed with other hills, at some distance from them. In the neighbourhood of the city there grew some corn, vines, olives, &c. The stately church erected by the empress Helena, on Mount Calvary, is still standing. It is called *the church of the sepulchre*; and is kept in good repair by the generous offerings of a constant concourse of pilgrims, who annually resort to it, as well as by the contributions of several Christian princes. The walls of this church are of stone, and the roof of cedar; the east end incloses Mount Calvary, and the west the holy sepulchre: the former is covered with a noble cupola, open at top, and supported by 16 massive columns. Over the high altar, at the east end, is another stately dome. The nave of the church constitutes the choir; and in the inside aisle are shown the places where the most remarkable circumstances of our Saviour's passion were transacted, together with the tombs of Godfrey and Baldwin, the two first Christian kings of Jerusalem. In the chapel of the crucifixion is shown the very hole in the rock in which the cross is said to

Jerusalem. have been fixed. The altar in this chapel hath three crosses on it; and is richly adorned, particularly with four lamps of immense value that hang before it, and are kept constantly burning. At the west end is that of the sepulchre, which is hewn in that form out of the solid rock, and hath a small dome supported by pillars of porphyry. The cloister round the sepulchre is divided into sundry chapels, appropriated to the several sorts of Christians who reside there; as Greeks, Armenians, Maronites, Jacobites, Copts, Abyssines, Georgians, &c. and on the north-west side of it are the apartments of the Latins, who have the care of the church, and are forced to reside constantly in it; the Turks keeping the keys of it, and not suffering any of them to go out, but obliging them to receive their provisions in at a wicket. At Easter there are some grand ceremonies performed in the church, representing our Lord's passion, crucifixion, death, and resurrection, at which a vast concourse of pilgrims commonly assist. For a particular account of them, we refer the reader to Doctors Shaw and Pococke.

On Mount Moriah, on the south-east part of the city, is an edifice called *Solomon's Temple*, standing on or near the same spot as the ancient; but when or by whom erected is uncertain. In the midst of it is a Turkish mosque, where the Jewish sanctum sanctorum is supposed to have stood. The building, which Dr Pococke thinks must have been formerly a Christian church, is held in the utmost veneration by the Turks.

The city is now under the government of a sangiac, who resides in a house said to have been that of Pontius Pilate, over-against the castle of Antonia built by Herod the Great. Many of the churches erected in memory of some remarkable gospel-transaction, have been since converted into mosques; into some of which money will procure admittance, but not into others. Both the friars and other Christians are kept so poor by the tyranny of the government, that the chief support and trade of the place consists in providing strangers with food and other accommodations, and selling them beads, relics, and other trinkets, for which they are obliged to pay considerable sums to the sangiac, as well as to his officers; and those are seldom so well contented with their usual duties, but they frequently extort some fresh ones, especially from the Franciscans, whose convent is the common receptacle for all pilgrims, and for which they have considerable allowances from the pope, and other crowned heads, besides the presents which strangers generally make them at their departure. The most remarkable antiquities in the neighbourhood of Jerusalem are, 1. The pools of Bethesda and Gihon; the former 120 paces long, 40 broad, and at least eight deep, but now without water; and the old arches, which it still discovers at the west end, are quite dammed up: the other, which is about a quarter of a mile without Bethlem-gate, is a very stately relick, 106 paces long, and 60 broad, lined with a wall and plaster, and still well stored with water. 2. The tomb of the Virgin Mary, in the valley of Jehoshaphat, into which one descends by a magnificent flight of 47 steps. On the right hand as one goes down, is also the sepulchre of St Ann the mother, and on the left that of Joseph the husband, of

the virgin-mother: some add likewise that of Jehoiachim her father. In all these are erected altars for priests of all sorts to say mass, and the whole is cut into the solid rock. 3. The tomb of King Jehoshaphat, cut likewise into the rock, and divided into several apartments; in one of which is his tomb, which is adorned with a stately portico and entablature over it. 4. That commonly called *Abjalom's pillar or place*, as being generally supposed to be that which he is said to have erected in his life-time to perpetuate his memory, as he had no male-issuë. The place, however, both within and without, hath more the resemblance of a sepulchre than any thing else: though we do not read that he was buried there, neither do the people here affirm that he was. There is a great heap of stones about it, which is continually increasing; the superstitious Jews and Turks always throwing some as they pass, in token of their abhorrence of Abjalom's unnatural rebellion against so good and holy a parent. The structure itself is about 20 cubits square, and 60 high, rising in a lofty square, adorned below with four columns of the Ionic order, with their capitals, entablatures, &c. to each front. From the height of 20 to 40 cubits, it is somewhat less, and quite plain, excepting a small fillet at the upper end; and from 40 to the top it changes into a round, which grows gradually into a point, the whole cut out of the solid rock. There is a room within, considerably higher than the level of the ground without, on the sides of which are niches, probably to receive coffins. 5. A little eastward of this is that called the *tomb of Zechariah*, the son of Barachiah, whom the Jews slew between the temple and the altar, as is commonly supposed. This fabric is all cut out of the natural rock, 18 feet high, and as many square; and adorned with Ionic columns on each front, cut out likewise of the same rock, and supporting a cornice. The whole ends in a pointed top, like a diamond. But the most curious, grand, and elaborate pieces, in this kind, are the grotts without the walls of Jerusalem, styled the *royal sepulchres*; but of what kings is not agreed on. They consist of a great number of apartments, some of them spacious, all cut out of the solid marble rock; and may justly be pronounced a royal work, and one of the most noble, surprising, and magnificent. For a particular account of them we must refer the reader, for want of room, to Pococke's Travels. In the neighbourhood of Jerusalem is a spot of ground, about 30 yards long and 15 broad, now the burying-place of the Armenians, which is shown as the *Aceldama*, or *Field of Blood*, formerly the *Potters Field*, and since styled *Campo Sancto*, or the *Holy Field*, purchased with the price of Judas's treason, for the burial of strangers. It is walled round, to prevent the Turks abusing the bones of Christians; and one half of it is taken up by a building in the nature of a charnel house. Besides the above, a great many other antiquities in the city and its environs are shown to strangers; there being scarce any place or transaction mentioned either in the Old or New Testament, but they show the very spot of ground where the one stood, and the other was done; not only here, but all over Judæa.

JESI, an ancient town of Italy, in the territory of the church, and in the marca on march of Ancona,

Jesso
||

with a bishop's see. It is seated on a mountain, near a river of the same name, in E. Long. 12. 20. N. Lat. 43. 50.

JESSO, JEDSO, or *Yadso*, a large island of Asia, to the north of Nippon, and said to be governed by a prince tributary to the empire of Japan; but is very little known to the Europeans, so that nothing can be said with certainty concerning it.

JESSES, ribbons that hang down from garlands or crowns in falconry; also short straps of leather fastened to the hawk's legs, and so to vervels.

JESTING, or *concise wit*, as distinguished from continued wit or humour, lies either in the thought, or the language, or both. In the first case it does not depend upon any particular words or turn of the expression. But the greatest fund of jests lies in the language, i. e. in tropes or verbal figures; those afforded by tropes consist in the metaphorical sense of the words, and those of verbal figures principally turn upon a double sense of the same word, or a similitude of sound in different words. The third kind of jokes, which lie both in the sense and language, arise from figures of sentences, where the figure itself consists in the sense, but the wit turns upon the choice of the words.

1
Foundation
of the or-
der.

JESUITS, or *the Society of Jesus*; a famous religious order of the Romish church, founded by Ignatius Loyola. See IGNATIUS.—The plan which this fanatic formed of its constitution and laws was suggested, as he gave out, and as his followers still teach, by the immediate inspiration of heaven. But notwithstanding this high pretension, his design met at first with violent opposition. The pope, to whom Loyola had applied for the sanction of his authority to confirm the institution, referred his petition to a committee of cardinals. They represented the establishment to be unnecessary as well as dangerous, and Paul refused to grant his approbation of it. At last, Loyola removed all his scruples by an offer which it was impossible for any pope to resist. He proposed, that besides the three vows of poverty, of chastity, and of monastic obedience, which are common to all the orders of regulars, the members of his society should take a fourth vow of obedience to the pope, binding themselves to go whithersoever he should command for the service of religion, and without requiring any thing from the holy see for their support. At a time when the papal authority had received such a shock by the revolt of so many nations from the Romish church; at a time when every part of the popish system was attacked with so much violence and success, the acquisition of a body of men, thus peculiarly devoted to the see of Rome, and whom it might set in opposition to all its enemies, was an object of the highest consequence. Paul instantly perceiving this, confirmed the institution of the Jesuits by his bull, granted the most ample privileges to the members of the society, and appointed Loyola to be the first general of the order. The event hath fully justified Paul's discernment, in expecting such beneficial consequences to the see of Rome from this institution. In less than half a century, the society obtained establishments in every country that adhered to the Roman catholic church: its power and wealth increased amazingly; the number of its members became great; their character as well as its accomplishments were still greater; and the Jesuits were celebrated by

2

the friends and dreaded by the enemies of the Romish faith as the most able and enterprising order in the church. Jesuits.

The constitution and laws of the society were perfected by Laynez and Aquaviva, the two generals who succeeded Loyola; men far superior to their master in abilities and in the science of government. They framed that system of profound and artful policy which distinguishes the order. The large infusion of fanaticism mingled with its regulation should be imputed to Loyola its founder. Many circumstances concurred in giving a peculiarity of character to the order of Jesuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire superior influence in the conduct of them.

The primary object of almost all the monastic orders is to separate men from the world, and from any concern in its affairs. In the solitude and silence of the cloister, the monk is called to work out his own salvation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle in its transactions. He can be of no benefit to mankind but by his example and by his prayers. On the contrary, the Jesuits are taught to consider themselves as formed for action. They are chosen soldiers, bound to exert themselves continually in the service of God, and of the pope his vicar on earth. Whatever tends to instruct the ignorant, whatever can be of use to reclaim or to oppose the enemies of the holy see, is their proper object. That they may have full leisure for this active service, they are totally exempted from those functions the performance of which is the chief business of other monks. They appear in no processions; they practise no rigorous austerities; they do not consume one half of their time in the repetition of tedious offices: but they are required to attend to all the transactions of the world, on account of the influence which these may have upon religion; they are directed to study the dispositions of persons in high rank, and to cultivate their friendship; and by the very constitution as well as genius of the order, a spirit of action and intrigue is infused into all its members. 3
The object
of the or-
der singu-
lar.

As the object of the society of Jesuits differed from that of the other monastic orders, the diversity was no less in the form of its government. The other orders are to be considered as voluntary associations, in which whatever affects the whole body is regulated by the common suffrage of all its members. The executive power is vested in the persons placed at the head of each convent or of the whole society; the legislative authority resides in the community. Affairs of moment, relating to particular convents, are determined in conventual chapters; such as respect the whole order are considered in general congregations. But Loyola, full of the ideas of implicit obedience, which he had derived from his military profession, appointed that the government of his order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power that was supreme and independent, extending to every person and to every case. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the society, and could remove 4
Peculiarities in its
policy.

Jesuits. them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrollable mandate he could impose on them any task, or employ them in what service soever he pleased. To his commands they were required to yield not only outward obedience, but to resign up to him the inclinations of their own wills and the sentiments of their own understandings. They were to listen to his injunctions as if they had been uttered by Christ himself. Under his direction they were to be mere passive instruments, like clay in the hands of the potter, or like dead carcases incapable of resistance. Such a singular form of policy could not fail to impress its character on all the members of the order, and to give a peculiar force to all its operations. There is not in the annals of mankind any example of such a perfect despotism, exercised not over monks shut up in the cells of a convent, but over men dispersed among all the nations of the earth.

5
power of
the gene-
ral.

As the constitutions of the order vest in the general such absolute dominion over all its members, they carefully provide for his being perfectly informed with respect to the character and abilities of his subjects. Every novice who offers himself as a candidate for entering into the order is obliged to manifest his conscience to the superior, or a person appointed by him; and is required to confess not only his sins and defects, but to discover the inclinations, the passions, and the bent of his soul. This manifestation must be renewed every six months. The society, not satisfied with penetrating in this manner into the innermost recesses of the heart, directs each member to observe the words and actions of the novices: they are constituted spies upon their conduct, and are bound to disclose every thing of importance concerning them to the superior. In order that this scrutiny into their character may be as complete as possible, a long noviciate must expire, during which they pass through the several gradations of ranks in the society; and they must have attained the full age of thirty-three years before they can be admitted to take the final vows, by which they become professed members. By these various methods, the superiors, under whose immediate inspection the novices are placed, acquire a thorough knowledge of their dispositions and talents. In order that the general, who is the soul that animates and moves the whole society, may have under his eye every thing necessary to inform or direct him, the provincials and heads of the several houses are obliged to transmit to him regular and frequent reports concerning the members under their inspection. In these they descend into minute details with respect to the character of each person, his abilities natural or acquired, his temper, his experience in affairs, and the particular department for which he is best fitted. These reports, when digested and arranged, are entered into registers kept of purpose, that the general may, at one comprehensive view, survey the state of the society in every corner of the earth; observe the qualifications and talents of its members; and thus choose, with perfect information, the instruments which his absolute power can employ in any service for which he thinks meet to destine them.

As it was the professed intention of the order of Jesuits to labour with unwearied zeal in promoting

the salvation of men, this engaged them of course in many active functions. From their first institution, they considered the education of youth as their peculiar province; they aimed at being spiritual guides and confessors; they preached frequently in order to instruct the people; they set out as missionaries to convert unbelieving nations. The novelty of the institution, as well as the singularity of his objects, procured the order many admirers and patrons. The governors of the society had the address to avail themselves of every circumstance in its favour; and in a short time the number as well as influence of its members increased wonderfully. Before the expiration of the sixteenth century, the Jesuits had obtained the chief direction of the education of youth in every catholic country in Europe. They had become the confessors of almost all its monarchs; a function of no small importance in any reign, but, under a weak prince, superior even to that of minister. They were the spiritual guides of almost every person eminent for rank or power. They possessed the highest degree of confidence and interest with the papal court, as the most zealous and able champions for its authority. The advantages which an active and enterprising body of men might derive from all these circumstances are obvious. They formed the minds of men in their youth. They retained an ascendant over them in their advanced years. They possessed, at different periods, the direction of the most considerable courts in Europe. They mingled in all affairs. They took part in every intrigue and revolution. The general, by means of the extensive intelligence which he received, could regulate the operations of the order with the most perfect discernment; and, by means of his absolute power, could carry them on with the utmost vigour and effect.

Jesuits
6
Progress of
the power
and influ-
ence of the
order.

Together with the power of the order, its wealth continued to increase. Various expedients were devised for eluding the obligation of the vow of poverty. The order acquired ample possessions in every catholic country; and by the number as well as magnificence of its public buildings, together with the value of its property, moveable or real, it vied with the most opulent of the monastic fraternities. Besides the sources of wealth common to all the regular clergy, the Jesuits possessed one which was peculiar to themselves. Under pretext of promoting the success of their missions, and of facilitating the support of their missionaries, they obtained a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce both in the East and West Indies. They opened warehouses in different parts of Europe, in which they vended their commodities. Not satisfied with trade alone, they imitated the example of other commercial societies, and aimed at obtaining settlements. They acquired possession accordingly of a large and fertile province in the southern continent of America, and reigned as sovereigns over some hundred thousand subjects.

7
Of its
wealth

Unhappily for mankind, the vast influence which the order of Jesuits acquired by all these different means, has been often exerted with the most pernicious effect. Such was the tendency of that discipline observed by the society in forming its members, and such

8
Pernicious
effects of
these on ci-
vil society.

the

Jesuits. the fundamental maxims in its constitution, that every Jesuit was taught to regard the interest of the order as the capital object to which every consideration was to be sacrificed. This spirit of attachment to their order, the most ardent perhaps that ever influenced any body of men, is the characteristic principle of the Jesuits, and serves as a key to the genius of their policy as well as the peculiarities in their sentiments and conduct.

As it was for the honour and advantage of the society that its members should possess an ascendant over persons in high rank or of great power; the desire of acquiring and preserving such a direction of their conduct with greater facility has led the Jesuits to propagate a system of relaxed and pliant morality, which accommodates itself to the passions of men, which justifies their vices, which tolerates their imperfections, which authorises almost every action that the most audacious or crafty politician would wish to perpetrate.

As the prosperity of the order was intimately connected with the preservation of the papal authority, the Jesuits, influenced by the same principle of attachment to the interests of their society, have been the most zealous patrons of those doctrines which tend to exalt ecclesiastical power on the ruins of civil government. They have attributed to the court of Rome a jurisdiction as extensive and absolute as was claimed by the most presumptuous pontiffs in the dark ages. They have contended for the entire independence of ecclesiastics on the civil magistrates. They have published such tenets concerning the duty of opposing princes who were enemies of the Catholic faith, as countenanced the most atrocious crimes, and tended to dissolve all the ties which connect subjects with their rulers.

As the order derived both reputation and authority from the zeal with which it stood forth in defence of the Romish church against the attacks of the reformers, its members, proud of this distinction, have considered it as their peculiar function to combat the opinions and to check the progress of the Protestants. They have made use of every art, and have employed every weapon against them. They have set themselves in opposition to every gentle or tolerating measure in their favour. They have incessantly stirred up against them all the rage of ecclesiastical and civil persecution.

Monks of other denominations have indeed ventured to teach the same pernicious doctrines, and have held opinions equally inconsistent with the order and happiness of civil society. But they, from reasons which are obvious, have either delivered such opinions with greater reserve, or have propagated them with less success. Whoever recollects the events which have happened in Europe during two centuries, will find that the Jesuits may justly be considered as responsible for most of the pernicious effects arising from that corrupt and dangerous casuistry, from those extravagant tenets concerning ecclesiastical power, and from that intolerant spirit, which have been the disgrace of the church of Rome throughout that period, and which have brought so many calamities upon civil society.

But, amidst many bad consequences flowing from

the institution of this order, mankind, it must be acknowledged, have derived from it some considerable advantages. As the Jesuits made the education of youth one of their capital objects, and as their first attempts to establish colleges for the reception of students were violently opposed by the universities in different countries, it became necessary for them, as the most effectual method of acquiring the public favour, to surpass their rivals in science and industry. This prompted them to cultivate the study of ancient literature with extraordinary ardour. This put them upon various methods for facilitating the instruction of youth; and, by the improvements which they made in it, they have contributed so much towards the progress of polite learning, that on this account they have merited well of society. Nor has the order of Jesuits been successful only in teaching the elements of literature; it has produced likewise eminent masters in many branches of science, and can alone boast of a greater number of ingenious authors than all the other religious fraternities taken together.

But it is in the new world that the Jesuits have exhibited the most wonderful display of their abilities, and have contributed most effectually to the benefit of the human species. The conquerors of that unfortunate quarter of the globe had nothing in view but to plunder, to enslave, and to exterminate its inhabitants. The Jesuits alone have made humanity the object of their settling there. About the beginning of the 17th century, they obtained admission into the fertile province of Paraguay, which stretches across the southern continent of America, from the bottom of the mountains of Potosi to the confines of the Spanish and Portuguese settlements on the banks of the river De la Plata. They found the inhabitants in a state little different from that which takes place among men when they first begin to unite together; strangers to the arts, subsisting precariously by hunting or fishing, and hardly acquainted with the first principles of subordination and government. The Jesuits set themselves to instruct and to civilize these savages. They taught them to cultivate the ground, to rear tame animals, and to build houses. They brought them to live together in villages. They trained them to arts and manufactures. They made them taste the sweets of society, and accustomed them to the blessings of security and order. These people became the subjects of their benefactors, who have governed them with a tender attention, resembling that with which a father directs his children. Respected and beloved almost to adoration, a few Jesuits presided over some hundred thousand Indians. They maintained a perfect equality among all the members of the community. Each of them was obliged to labour, not for himself alone, but for the public. The produce of their fields, together with the fruits of their industry of every species, were deposited in common storehouses, from which each individual received every thing necessary for the supply of his wants. By this institution, almost all the passions which disturb the peace of society, and render the members of it unhappy, were extinguished. A few magistrates, chosen by the Indians themselves, watched over the public tranquillity, and secured obedience to the laws. The sanguinary punishments frequent under other governments were unknown. Settlement in Paraguay.

admonition

Jesuits. admonition from a Jesuit, a slight mark of infamy, or on some singular occasion, a few lashes with a whip, were sufficient to maintain good order among these innocent and happy people.

But even in this meritorious effort of the Jesuits for the good of mankind, the genius and spirit of their order have mingled and are discernible. They plainly aimed at establishing in Paraguay an independent empire, subject to the society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominion over all the southern continent of America. With this view, in order to prevent the Spaniards or Portuguese in the adjacent settlements from acquiring any dangerous influence over the people within the limits of the province subject to the society, the Jesuits endeavoured to inspire the Indians with hatred and contempt of these nations. They cut off all intercourse between their subjects and the Spanish or Portuguese settlements. They prohibited any private trader of either nation from entering their territories. When they were obliged to admit any person in a public character from the neighbouring governments, they did not permit him to have any conversation with their subjects; and no Indian was allowed even to enter the house where these strangers resided unless in the presence of a Jesuit. In order to render any communication between them as difficult as possible, they industriously avoided giving the Indians any knowledge of the Spanish or of any other European language; but encouraged the different tribes which they had civilized to acquire a certain dialect of the Indian tongue, and laboured to make that the universal language throughout their dominions. As all these precautions, without military force, would have been insufficient to have rendered their empire secure and permanent, they instructed their subjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed and regularly disciplined. They provided a great train of artillery, as well as magazines stored with all the implements of war. Thus they established an army so numerous and well-appointed, as to be formidable in a country where a few sickly and ill-disciplined battalions composed all the military force kept on foot by the Spaniards or Portuguese.

Such were the laws, the policy, and the genius of this formidable order; of which, however, a perfect knowledge has only been attainable of late. Europe had observed, for two centuries, the ambition and power of the order. But while it felt many fatal effects of these, it could not fully discern the causes to which they were to be imputed. It was unacquainted with many of the singular regulations in the political constitution or government of the Jesuits, which formed the enterprising spirit of intrigue that distinguished its members, and elevated the body itself to such a height of power. It was a fundamental maxim with the Jesuits, from their first institution, not to publish the rules of their order. These they kept concealed as an impenetrable mystery. They never communicated them to strangers, nor even to the greater part of their own members. They refused to produce them when required by courts of justice; and, by a strange solecism in policy, the civil power in different countries

authorized or connived at the establishment of an order of men, whose constitution and laws were concealed with a solicitude which alone was a good reason for having excluded them. During the prosecutions lately carried on against them in Portugal and France, the Jesuits have been so inconsiderate as to produce the mysterious volumes of their institute. By the aid of these authentic records, the principles of their government may be delineated, and the sources of their power investigated, with a degree of certainty and precision, which, previous to that event, it was impossible to attain.

The pernicious effects, however, of the spirit and constitution of this order, rendered it early odious to some of the principal powers in Europe, and gradually brought on its downfall. The emperor Charles V. saw it expedient to check its progress in his dominions; it was expelled England, by proclamation of James I. in 1604; Venice, in 1606; Portugal, in 1759; France, in 1764; Spain and Sicily, in 1767; and totally suppressed and abolished by Pope Clement XIV. in 1773.

JESUIT'S BARK. See CINCHONA, BOTANY *Index*; and for its history and properties, see CINCHONA and MATERIA MEDICA *Index*.

JESUS the Son of SIRACH, a native of Jerusalem, composed about 200 B. C. the Book of Ecclesiasticus, called by the Greeks *Παυαγέλος*, "replenished with virtue;" who also quote it under the title of *the Wisdom of Solomon the son of Sirach*. His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B. C. We have this Greek version, but the Hebrew text is lost.

JESUS CHRIST, the Son of God, and Saviour of mankind, descended from heaven, and took upon him the human nature in Judæa, towards the conclusion of the reign of Herod the Great, king of that country. The place of his birth was Bethlehem, a flourishing city of Judæa; but the year in which he was born is not precisely ascertained. The most general opinion is that it happened about the year of Rome 748 or 749, and about 18 months before the death of Herod. Four inspired writers have transmitted to us an account of the life of Jesus Christ. They mention particularly his birth, lineage, family, and parents; but say very little concerning his infancy and earlier youth. Herod being informed that the Messiah, or king of the Jews, so much spoken of by the prophets, was now born, being afraid that his kingdom should now be taken away, contrived how to destroy his supposed rival: but Christ, being carried, while very young, into Egypt, escaped the cruelty of the tyrant; who, being determined to make sure work, made a general massacre of the infants about Bethlehem, from the age of two years and under.

After the death of Herod, our Saviour was brought back to Judæa; but we are totally ignorant of what his employment was during the interval between his return thither and the time of his entering upon the ministry. We know only, that when he was but 12 years of age, he disputed in the temple with the most learned of the Jewish doctors; whom he surprised with his knowledge, and the answers he gave to their questions. After this, as the scripture tells us, he

continued

Jesuits
B. rk
J
Christ.

Jesus
Christ.

continued with his parents, and was subject to them, till he entered upon his ministry. It is said, indeed, though upon no sure foundation, that during this period he followed the trade of his father, who was a carpenter. In the 30th year of his age, he began his public ministry; to which, the attention of the people was drawn by the preaching of John, a prophet miraculously inspired of God to proclaim the existence of the Saviour, as now descended upon earth, and visible to the eyes of all; and by this prophet Christ himself was baptized in the waters of Jordan, that he might not, in any point, neglect to answer the demands of the Jewish law.

It is not necessary here to enter into a particular detail of the life and actions of Jesus Christ. Every one knows, that his life was one continued scene of the most perfect sanctity, and the purest and most active virtue; not only without spot, but also beyond the reach of suspicion. And it is also well known, that by miracles of the most stupendous kind, and not more stupendous than salutary and beneficent, he displayed to the universe the truth of that religion which he brought with him from above, and demonstrated the reality of his divine commission in the most illustrious manner. For the propagation of his religion through the country of Judæa, our Saviour chose 12 apostles; whom, however, he sent out only once, and after their return kept them constantly about his person. But, besides these, he chose other 70, whom he dispersed throughout the country.

There have been many conjectures concerning the reason why the number of apostles was fixed at 12, and that of the other teachers at 70. The first, however, was, according to our Saviour's own words (Matt. xix. 28.), an allusion to the 12 tribes of Israel, thereby intimating that he was the king of these 12 tribes; and as the number of his other messengers answers evidently to that of the senators who composed the Sanhedrim, there is a high degree of probability in the conjecture of those who think that Christ by this number designed to admonish the Jews, that the authority of their Sanhedrim was now at an end, and that all power with respect to religious matters was vested in him alone. His ministry, however, was confined to the Jews; nor, while he remained upon earth, did he permit his apostles or disciples to extend their labours beyond this favoured nation. At the same time, if we consider the illustrious acts of mercy and benevolence that were performed by Christ, it will be natural to conclude, that his fame must soon have spread abroad in other countries. Indeed this seems probable from a passage in scripture, where we are told that some Greeks applied to the apostle Philip in order to see Jesus. We learn also from authors of no small note, that Abgarus * king of Edessa, being seized with a severe and dangerous illness, wrote to our Lord, imploring his assistance; and that Jesus not only sent him a gracious answer, but also accompanied it with his picture, as a mark of his esteem for that pious prince. These letters are still extant; but by the judicious part of mankind are universally looked upon as spurious; and indeed the late Mr Jones, in his treatise entitled *A new and full method of settling the canonical authority of the New Testament*, hath offered

* See *Abgarus*.

reasons which seem almost unanswerable against the authenticity of the whole transaction.

The preaching of our Saviour, and the numberless miracles he performed, made such an impression on the body of the Jewish nation, that the chief priests and leading men, jealous of his authority, and provoked at his reproaching them with their wicked lives, formed a conspiracy against him. For a considerable time their designs proved abortive; but at last Jesus, knowing that he had fulfilled every purpose for which he came into the world, suffered himself to be taken through the treachery of one of his disciples, named *Judas Iscariot*, and was brought before the Sanhedrim. In this assembly he was accused of blasphemy; and being afterwards brought before Pilate the Roman governor, where he was accused of sedition, Pilate was no sooner set down to judge in this cause, than he received a message from his wife, desiring him to have nothing to do with the affair, having that very day had a frightful dream on account of our Saviour, whom she called *that just man*. The governor, intimidated by this message, and still more by the majesty of our Saviour himself, and the evident falshood of the accusations brought against him, was determined if possible to save him. But the clamours of an enraged populace, who at last threatened to accuse Pilate himself as a traitor to the Roman emperor, got the better of his love of justice, which indeed on other occasions was not very fervent.

Our Saviour was now condemned by his judge, though contrary to the plainest dictates of reason and justice; was executed on a cross between two thieves, and very soon expired. Having continued three days in a state of death, he rose from the dead, and made himself visible to his disciples as formerly. He conversed with them 40 days after his resurrection, and employed himself during that time in instructing them more fully concerning the nature of his kingdom; and having manifested the certainty of his resurrection to as many witnesses as he thought proper, he was, in the presence of many of his disciples, taken up into heaven, there to remain till the end of the world. See CHRISTIANITY.

JET, a black inflammable substance of the bituminous kind, harder than asphaltum, and susceptible of a good polish. It becomes electrical by rubbing, attracting light bodies like yellow amber. It swims on water, so that its specific gravity must be less than 1000; notwithstanding which it has been frequently confounded with the *lapis obsidianus*, the specific gravity of which, according to Kirwan, is no less than 1744. It also resembles cannel coal extremely in its hardness, receiving a polish, not soiling the fingers, &c. so that it has also been confounded with this. The distinction, however, is easily made betwixt the two; for cannel-coal wants the electrical properties of jet, and is likewise so heavy as to sink in water; its specific gravity being no less than 1273; whereas that of jet, as has already been said, is less than 1000.

M. Magellan is of opinion that jet is a true amber, differing from the yellow kind only in the mere circumstance of colour, and being lighter on account of the greater quantity of bituminous matter which enters into its composition. When burning it emits

Jesus
Christ,
Jet.

Jet
||
Jewel.

a bituminous smell. It is never found in strata or continued masses like fossil stones; but always in separate and unconnected heaps like the true amber. Great quantities of it have been dug up in the Pyrenean mountains; also near *Batalka*, a small town of Portugal; and in Galicia in Spain. It is found also in Ireland, Sweden, Prussia, Germany, and Italy. It is used in making small boxes, buttons, bracelets, mourning jewels, &c. Sometimes also it is employed in conjunction with proper oils in making varnishes. When mixed with lime in powder, it is said to make very hard and durable cement.

JET d'Eau, a French term, frequently also used with us, for a fountain that casts up water to a considerable height in the air.

JETTE, the border made round the filts under a pier, in certain old bridges, being the same with stalling; consisting of a strong framing of timber filled with stones, chalk, &c. to preserve the foundations of the piers from injury.

JETTY-HEAD, a name usually given in the royal dock-yards to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, whose side forms one of the cheeks of a dry or wet dock.

JEWEL, any precious stone, or ornament beset with them. See **DIAMOND**, **RUBY**, &c.

JEWELS made a part of the ornaments with which the Jews, Greeks, and Romans, especially their ladies of distinction, adorned themselves. So prodigious was the extravagance of the Roman ladies, in particular, that Pliny the elder says he saw Lollia Paulina with an equipage of this kind amounting, according to Dr Arbuthnot's calculation, to 322,916l. 13s. 4d. of our money. It is worthy of observation, that precious stones among the Romans and all the ancients were much scarcer, and consequently in higher esteem, than they are amongst us, since a commerce has been opened with the Indies.—The ancients did not know how to cut and polish them to much perfection; but coloured stones were not scarce, and they cut them very well either hollow or in relief.—When luxury had gained ground amongst them, the Romans hung pendants and pearls in their ears; and for this purpose the ears of both sexes were frequently bored. See **EARS**.

JEWEL, *John*, a learned English writer and bishop, was born in 1522, and educated at Oxford. In 1540 he proceeded A. B. became a noted tutor, and was soon after chosen rhetoric lecturer in his college. In February 1544, he commenced A. M. He had early imbibed Protestant principles, and inculcated the same to his pupils; but this was carried on privately till the accession of King Edward VI. in 1546, when he made a public declaration of his faith, and entered into a close friendship with Peter Martyr, who was made professor of divinity at Oxford. In 1550, he took the degree of B. D. and frequently preached before the university with great applause. At the same time he preached and catechised every other Sunday at Sunningwell in Berkshire, of which church he was rector. Upon the accession of Queen Mary to the crown in 1553, he was one of the first who felt the rage of the storm then raised against the reformation; for before any law was made, or order given by the queen, he was expelled Corpus Christi college by the

Vol. XI. Part I.

fellows, by their own private authority; but he continued in Oxford till he was called upon to subscribe to some of the Popish doctrines, under the severest penalties, which he submitted to. However, this did not procure his safety; for he was obliged to fly, and after encountering many difficulties, arrived at Frankfort, in the 2d year of Queen Mary's reign, where he made a public recantation of his subscription to the Popish doctrines. Thence he went to Straßburgh, and afterwards to Zurich, where he attended Peter Martyr, in whose house he resided. He returned to England in 1558, after Queen Mary's death; and in 1559, was consecrated bishop of Salisbury. This promotion was given him as a reward for his great merit and learning; and another attestation of these was given him by the university of Oxford, who, in 1565, conferred on him in his absence the degree of D. D. In this character he attended the queen to Oxford the following year, and presided at the divinity disputations held before her majesty on that occasion. He had before greatly distinguished himself by a sermon preached at St Paul's cross, presently after he was made a bishop, wherein he gave a public challenge to all the Roman catholics in the world, to produce but one clear and evident testimony out of any father or famous writer, who flourished within 600 years after Christ, for any one of the articles which the Romanists maintain against the church of England; and two years afterwards, he published his famous apology for this church. In the mean time, he gave a particular attention to his diocese; where he began in his first visitation, and perfected in his last, such a reformation, not only in his cathedral and parochial churches, but in all the churches of his jurisdiction, as procured him and the whole order of bishops due reverence and esteem. For he was a careful overlooker and strict observer, not only of all the flocks, but also of the pastors, in his diocese: and he watched so narrowly upon the proceedings of his chancellor and archdeacons, and of his stewards and receivers, that they had no opportunities of being guilty of oppression, injustice, or extortion, nor of being a burden to the people, or a scandal to himself. To prevent these and the like abuses, for which the ecclesiastical courts are often too justly censured, he sat often in his consistory-court, and saw that all things were carried rightly there: he also sat often as assistant on the bench of civil justice, being himself a justice of the peace. Amidst these employments, however, the care of his health was too much neglected; to which, indeed, his general course of life was totally unfavourable. He rose at four o'clock in the morning; and, after prayers with his family at five, and in the cathedral about six, he was so fixed to his studies all the morning, that he could not without great violence be drawn from them. After dinner, his doors and ears were open to all suitors; and it was observed of him, as of Titus, that he never sent any sad from him. Suitors being thus dismissed, he heard, with great impartiality and patience, such causes debated before him, as either devolved to him as a judge, or were referred to him as an arbitrator; and if he could spare any time from these, he reckoned it as clear gain to his study. About nine at night he called all his servants to an account how they had spent the day, and he went to prayers with them. From

the chapel he withdrew again to his study till near midnight, and from thence to his bed; in which, when he was laid, the gentleman of his bed-chamber read to him till he fell asleep. This watchful and laborious life, without any recreation at all, except what his necessary refreshment at meals and a very few hours of rest afforded him, wasted his life too fast. He died at Monkton-Farley, in 1571, in the 50th year of his age. He wrote, 1. A view of a seditious bull sent into England by Pope Pius V. in 1569. 2. A treatise on the Holy Scriptures. 3. An exposition of St Paul's two epistles to the Thessalonians. 4. A treatise on the sacrament. 5. An apology for the national church. 6. Several sermons, controversial treatises, and other works.

“ This excellent prelate (says the Rev. Mr Granger) was one of the greatest champions of the reformed religion, as he was to the church of England what Bellarmine was to that of Rome. His admirable Apology was translated from the Latin by Anne, the second of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was published, as it came from her pen, in 1564, with the approbation of the queen and the prelates. The same Apology was printed in Greek at Constantinople, under the direction of St Cyril the patriarch. His Defence of his Apology, against Harding and other Popish divines, was in such esteem, that Queen Elizabeth, King James I. King Charles I. and four successive archbishops, ordered it to be kept chained in all parish-churches for public use.

Jewel Blocks, in the sea language, a name given to two small blocks which are suspended at the extremity of the main and fore top-sail yards, by means of an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is, to retain the upper part of the top-mast studding-sails beyond the skirts of the top-sails, so that each of those sails may have its full force of action, which would be diminished by the encroachment of the other over its surface. The *haliards*, by which those studding-sails are hoisted, are accordingly passed through the jewel-blocks; whence, communicating with a block on the top-mast head, they lead downwards to the top or decks, where they may be conveniently hoisted. See SAIL.

JEWES, a name derived from the patriarch Judah, and given to the descendants of Abraham by his eldest son Isaac, who for a long time possessed the land of Palestine in Asia, and are now dispersed through all nations in the world.

The history of this people, as it is the most singular, so is it also the most ancient in the world; and the greatest part being before the beginning of profane history, depends entirely on the authenticity of the Old Testament, where it is only to be found.—To repeat here what is said in the sacred writings would both be superfluous and tedious, as those writings are in every person's hands, and may be consulted at pleasure. It seems most proper therefore to commence the history of the Jews from their return to Jerusalem from Babylon, and the rebuilding of their city and temple under Ezra and Nehemiah, when the scripture leaves off any farther accounts, and profane historians begin to take notice of them. We shall, however, premise a

chronological list of their judges and kings down to the captivity.

The Israelites had no king of their nation till Saul. Before him, they were governed, at first by elders, as in Egypt; then by princes of God's appointment, as Moses and Joshua; then by judges, such as Othniel, Ehud, Shamgar, Gideon, Jephthah, Samson, Eli, Samuel; and last of all by kings, as Saul, David, Solomon, Rehoboam, &c.

A List of the Judges of Israel in a Chronological Order. The Numbers prefixed denote the Years of the World.

2570. THE death of Joshua.
 2585. The government of the elders for about 15 years.
 2592. An anarchy of about seven years. The history of Micah, the conquest of the city of Lailih by part of the tribe of Dan, and the war undertaken by the 11 tribes against Benjamin, are all referred to this time.
 2591. The first servitude under Cushan-rishathaim king of Mesopotamia began in 2591, and lasted eight years to 2599.
 2599. Othniel delivered Israel in the 40th year after peace established in the land by Joshua.
 2662. A peace of about 62 years, from the deliverance procured by Othniel, in 2599, to 2662, when the second servitude under Eglon king of the Moabites happened. It lasted 18 years.
 2679. Ehud delivers Israel.
 After him Shamgar governed, and the land was in peace till the 40th year after the first deliverance procured by Othniel.
 2699. The third servitude under the Canaanites, which lasted 20 years, from 2699 to 2719.
 2719. Deborah and Barak deliver the Israelites: from the deliverance procured by Ehud to the end of Deborah and Barak's government, were 40 years.
 2768. Abimelech the natural son of Gideon is acknowledged king by the Shechemites.
 2771. He died at the siege of Thebez in Palestine.
 2772. Tola after Abimelech governs for 23 years, from 2772 to 2795.
 2795. Jair succeeds Tola, and governs 22 years, from 2795 to 2816.
 2799. The fifth servitude under the Philistines, which lasted 18 years, from 2799 to 2817.
 2817. The death of Jair.
 2817. Jephthah is chosen head of the Israelites beyond Jordan; he defeated the Ammonites, who oppressed them. Jephthah governed six years, from 2817 to 2823.
 2823. The death of Jephthah.
 2830. Ibzan governs seven years, from 2823 to 2830.
 2840. Elon succeeds Ibzan. He governs from 2830 to 2840.
 Abdon judges Israel eight years, from 2840 to 2848.
 2848. The sixth servitude, under the Philistines, which lasted 40 years, from 2848 to 2888.
 2848. Eli the high-priest, of the race of Ithamar, governed 40 years, the whole time of the servitude under the Philistines.
 2849. The birth of Samson.

- Jews.** 2887. The death of Samson, who was judge of Israel during the judicature of Eli the high-priest.
 2888. The death of Eli, and beginning of Samuel's government, who succeeded him.
 2909. The election and anointing of Saul, first king of the Hebrews.

A Chronological List of the Kings of the Hebrews.

SAUL, the first king of the Israelites, reigned 40 years, from the year of the world 2909 to 2949.

Ishboeth the son of Saul succeeded him, and reigned six or seven years over part of Israel, from 2949 to 2956.

David was anointed king by Samuel in the year of the world 2934; but did not enjoy the regal power till the death of Saul in 2949, and was not acknowledged king of all Israel till after the death of Ishboeth in 2956. He died in 2990 at the age of 70.

Solomon his son succeeded him; he received the royal unction in the year 2989. He reigned alone after the death of David in 2990. He died in 3029, after a reign of 40 years.

After his death, the kingdom was divided; and the ten tribes having chosen Jeroboam for their king, Rehoboam, the son of Solomon, reigned only over the tribes of Judah and Benjamin.

The Kings of Judah.

Rehoboam, the son and successor of Solomon, reigned 17 years; from the year 3029 to 3046.

Abijam, three years, from 3046 to 3049.

Asa, 41 years, from 3049 to 3090.

Jehoshaphat, 25 years, from 3090 to 3115.

Jehoram, four years, from 3115 to 3119.

Ahaziah, one year, from 3119 to 3120.

Athaliah, his mother, reigned six years, from 3120 to 3126.

Joash was set upon the throne by Jehoiada the high-priest, in 3126. He reigned 40 years, to the year 3165.

Amaziah, 29 years, from 3165 to 3194.

Uzziah, otherwise called *Azariah*, reigned 27 years, to the year 3221. Then attempting to offer incense in the temple, he was struck with a leprosy, and obliged to quit the government. He lived after this 26 years, and died in 3246.

Jotham his son took upon him the government in the year of the world 3221. He reigned alone in 3246, and died in 3262.

Ahaz succeeded Jotham in the year of the world 3262. He reigned 16 years, to 3278.

Hezekiah, 28 years, from 3278 to 3306.

Manasseh, 55 years, from the year of the world 3306 to 3361.

Amon, 2 years, from 3361 to 3363.

Josiah, 31 years, from 3363 to 3394.

Jehoahaz, three months.

Eliakim, or Jehoiakim, 11 years, from the year 3394 to 3405.

Jehoiachin, or Jechoniah, reigned three months and ten days, in the year 3405.

Mattaniah, or Zedekiah, reigned 11 years, from 3405 to 3416. In the last year of his reign Jerusalem was taken, the temple burnt, and Judah carried into captivity beyond the Euphrates.

Kings of Israel.

Jeroboam reigned 22 years, from 3029 to 3051.

Nadab, one year. He died in 3051.

Baalha, 22 years, from 3052 to 3074.

Elah, two years. He died in 3075.

Zimri, seven days.

Omri, 11 years, from 3075 to 3086. He had a competitor Tibni, who succeeded, and died in what year we know not.

Ahab, 21 years, from 3086 to 3107.

Ahaziah, two years, from 3106 to 3108.

Jehoram, the son of Ahab, succeeded him in 3108.

He reigned 12 years, and died in 3120.

Jehu usurped the kingdom in 3120, reigned 28 years, and died in 3148.

Jehoahaz reigned 17 years, from 3148 to 3165.

Joash reigned 14 years, from 3165 to 3179.

Jeroboam II. reigned 41 years, from 3179 to 3220.

Zachariah, 12 years, from 3220 to 3232.

Shallum reigned a month. He was killed in 3233.

Menahem, 10 years, from 3233 to 3243.

Pekahiah, two years, from 3243 to 3245.

Pekah, 20 years, from 3245 to 3265.

Holhea, 18 years, from 3265 to 3283. Here the kingdom of Israel had an end after a duration of 253 years.

Cyrus the Great, king of Persia, having conquered Babylon and almost all the western parts of Asia, receiving the desolate and ruinous condition in which the province of Palestine lay, formed a design of restoring the Jews to their native country, and permitting them to rebuild Jerusalem and re-establish their worship. For this purpose he issued out a decree in the first year of his reign, about 536 B. C. by which they were allowed not only to return and rebuild their city, but to carry along with them all the sacred vessels which Nebuchadnezzar had carried off, and engaged to defray the expence of building the temple himself. This offer was gladly embraced by the more zealous Jews of the tribes of Judah, Benjamin, and Levi; but many more, being no doubt less sanguine about their religion, chose to stay where they were.

In 534. B. C. the foundations of the temple were laid, and matters seemed to go on prosperously, when the undertaking was suddenly obstructed by the Samaritans. These came at first expressing an earnest desire to assist in the work, as they worshipped the same God with the Jews: but the latter refused their assistance, as they knew they were not true Israelites, but the descendants of those heathens who had been transplanted into the country of the ten tribes after their captivity by Shalmanezar. This refusal proved the source of all that bitter enmity which afterwards took place between the Jews and Samaritans; and the immediate consequence was, that the latter made all the opposition in their power to the going on of the work. At last, however, all obstacles were surmounted, and the temple finished as related in the books of Ezra and Nehemiah. The last of these chiefs died about 409 B. C. after having restored the Jewish worship to its original purity, and reformed a number of abuses which took place immediately on its commencement.

But though the Jews were now restored to the free exercise of religion, they were neither a free nor a powerful people as they had formerly been. They were few in number, and their country only a province of Syria, subject to the kings of Persia. The

Admini-
stration of
affairs con-
ferred on
the high-
priests.

Syrian governors conferred the administration of affairs upon the high-priests; and their accepting this office, and thus deviating from the law of Moses, must be considered as one of the chief causes of the misfortunes which immediately befel the people, because it made room for a set of men, who aspired at this high office merely through ambition or avarice, without either zeal for religion or love for their country. It besides made the high-priesthood capable of being disposed of at the pleasure of the governors, whereas the Mosaic institution had fixed it unalienably in the family of Aaron.—Of the bad effects of this practice a fatal instance happened in 373 B. C. Bagoses, governor of Syria, having contracted an intimate friendship with Jeshua the brother of Johanan the high-priest, promised to raise him to the pontifical office a few years after his brother had been invested with it. Jeshua came immediately to Jerusalem, and acquainted his brother with it. Their interview happened in the inner court of the temple; and a scuffle ensuing, Jeshua was killed by his brother, and the temple thus polluted in the most scandalous manner. The consequence to the Jews was, that a heavy fine was laid on the temple, which was not taken off till seven years after.

The first public calamity which befel the Jewish nation after their restoration from Babylon, happened in the year 351 B. C: for having some how or other disobliged Darius Ochus king of Persia, he besieged and took Jericho, and carried off all the inhabitants captives. From this time they continued faithful to the Persians, inasmuch that they had almost drawn upon themselves the displeasure of Alexander the Great. That monarch having resolved upon the siege of Tyre, and being informed that the city was wholly supplied with provisions from Judea, Samaria, and Galilee, sent to Jaddua, then high-priest, to demand of him that supply which he had been accustomed to pay to the Persians. The Jewish pontiff excused himself on account of his oath of fidelity to Darius; which so provoked Alexander, that he had no sooner completed the reduction of Tyre than he marched against Jerusalem. The inhabitants, then, being with good reason thrown into the utmost consternation, had recourse to prayers; and Jaddua is said, by a divine revelation, to have been commanded to go and meet Alexander. He obeyed accordingly, and set out on his journey, dressed in his pontifical robes, at the head of all his priests in their proper habits, and attended by the rest of the people dressed in white garments. Alexander is said to have been seized with such awful respect on seeing this venerable procession, that he embraced the high-priest, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. His followers being surpris'd at this unexpected behaviour, the Macedonian monarch informed them, that he paid that respect not to the priest, but to his God, as an acknowledgment for a vision which he had been favoured with at Dia; where he had been promised the conquest of Persia, and encouraged in his expedition, by a person of much the same aspect and dressed in the same habit with the pontiff before him. He afterwards accompanied Jaddua into Jerusalem, where he offered sacrifices in the temple. The high-priest showed him

4

priest with
Alexander
the Great.

also the prophecies of Daniel, wherein the destruction of the Persian empire by himself is plainly set forth; in consequence of which the king went away highly satisfied, and at his departure asked the high-priest if there was nothing in which he could gratify himself or his people? Jaddua then told him, that, according to the Mosaic law, they neither sowed nor ploughed on the seventh year; therefore would esteem it an high favour if the king would be pleased to remit their tribute in that year. To this request the king readily yielded; and having confirmed them in the enjoyment of all their privileges, particularly that of living under their own laws, he departed.

Whether this story deserves credit or not (for the whole transaction is not without reason called in question by some), it is certain that the Jews were much favoured by Alexander; but with him their good fortune seem'd also to expire. The country of Judea being situated between Syria and Egypt, became subject to all the revolutions and wars which the ambitious successors of Alexander waged against each other. At first it was given, together with Syria and Phœnicia to Leomedon the Mitylenian, one of Alexander's generals, but he being soon after stripped of the other two by Ptolemy, Judea was next summoned to yield to the conqueror. The Jews scrupled to break their oath of fidelity to Leomedon; and were of consequence invaded by Ptolemy at the head of a powerful army. The open country was easily reduced; but the city being strongly fortified both by art and nature, threatened a strong resistance. A superstitious fear for breaking the sabbath, however, prevented the besieged from making any defence on that day; of which Ptolemy being informed, he caused an assault to be made on the sabbath, and easily carried the place. At first he treated them with great severity, and carried 100,000 men of them into captivity; but reflecting soon after on their known fidelity to their conquerors, he restored them to all the privileges they had enjoyed under the Macedonians. Of the captives he put some into garrisons, and others he settled in the countries of Libya and Cyrene. From those who settled in the latter of these countries descended the Cyrenean Jews mentioned by the writers of the New Testament.

5
Miserable
state of the
Jews after
Alexander's
death.

Five years after Ptolemy had subdued Judea, he was forced to yield it to Antigonus, reserving to himself only the cities of Ace, Samaria, Joppa, and Gaza; and carrying off an immense booty, together with a great number of captives, whom he settled at Alexandria, and endowed with considerable privileges and immunities.—Antigonus behaved in such a tyrannical manner, that great numbers of his Jewish subjects fled into Egypt, and others put themselves under the protection of Seleucus, who also granted them considerable privileges. Hence this nation came gradually to be spread over Syria and Asia Minor; while Judea seem'd to be in danger of being depopulated till it was recovered by Ptolemy in 292. The affairs of the Jews then took a more prosperous turn, and continued in a thriving way till the reign of Ptolemy Philopator, when they were grievously oppress'd by the incursions of the Samaritans, at the same time that Antiochus Theos king of Syria invaded Galilee. Ptolemy, however, marched against Antiochus, and defeated him;

Jews. him: after which, having gone to Jerusalem to offer sacrifices, he ventured to profane the temple itself by going into it. He penetrated through the two outer courts; but as he was about to enter the sanctuary, he was struck with such dread and terror that he fell down half dead. A dreadful persecution was then raised against the Jews, who had attempted to hinder him in his impious attempt; but this persecution was stopped by a still more extraordinary accident related under the article EGYPT, N^o 30, and the Jews again received into favour.

6 About the year 204 B. C. the country of Judea was subdued by Antiochus the Great; and on this occasion the loyalty of the Jews to the Egyptians failed them, the whole nation readily submitting to the king of Syria. This attachment so pleased the Syrian monarch, that he sent a letter to his general, wherein he acquainted him that he designed to restore Jerusalem to its ancient splendor, and to recal all the Jews that had been driven out of it: that out of his singular respect to the temple of God, he granted them 20,000 pieces of silver, towards the charges of the victims, frankincense, wine, and oil; 1400 measures of fine wheat, and 375 measures of salt, towards their usual oblations: that the temple should be thoroughly repaired at his cost; that they should enjoy the free exercise of their religion; and restore the public service of the temple, and the priests, Levites, singers, &c. to their usual functions: that no stranger, or Jew that was unpurified, should enter farther into the temple than was allowed by their law; and that no flesh of unclean beasts should be brought into Jerusalem; not even their skins: and all these under the penalty of paying 3000 pieces of silver into the treasury of the temple. He further granted an exemption of taxes for three years to all the dispersed Jews that should come within a limited time to settle in the metropolis; and that all who had been sold for slaves within his dominions should be immediately set free.

7 This sudden prosperity proved of no long duration. About the year 176, a quarrel happened between Onias, at that time high priest, and one Simon, governor of the temple, which was attended with the most fatal consequences. The causes of this quarrel are unknown. The event, however, was, that Simon finding he could not get the better of Onias, informed Apollonius governor of Cœlosyria and Palestine, that there was at that time in the temple an immense treasure, which at his pleasure might be seized upon for the use of the king of Syria. Of this the governor instantly sent intelligence to the king, who dispatched one Heliodorus to take possession of the supposed treasure. This person, through a miraculous interposition, as the Jews pretend, failed in his attempt of entering the temple; upon which Simon accused the high-priest to the people, as the person who had invited Heliodorus to Jerusalem. This produced a kind of civil war, in which many fell on both sides. At last Onias having complained to the king, Simon was banished; but soon after, Antiochus Epiphanes having ascended the throne of Syria, Jason, the high-priest's brother, taking advantage of the necessities of Antiochus, purchased from him the high-priesthood at the price of 350 talents, and obtained an order that his brother should be sent to Antioch, there to be confined for life.

Jews. Jason's next step was to purchase liberty, at the price of 150 talents more, to build a gymnasium at Jerusalem, similar to those which were used in the Grecian cities, and to make as many Jews as he pleased free citizens of Antioch. By means of these powers, he became very soon able to form a strong party in Judea; for his countrymen were exceedingly fond of the Grecian customs, and the freedom of the city of Antioch was a very valuable privilege. From this time therefore a general apostasy took place; the service of the temple was neglected, and Jason abandoned himself without remorse to all the impieties and absurdities of paganism.

8 He did not, however, long enjoy his ill-acquired dignity. Having sent his brother Menelaus with the usual tribute to Antiochus, the former took the opportunity of supplanting Jason in the same manner that he had supplanted Onias. Having offered for the high-priesthood 300 talents more than his brother had given, he easily obtained it, and returned with his new commission to Jerusalem. He soon got himself a strong party: but Jason proving too powerful, forced Menelaus and his adherents to retire to Antioch. Here, the better to gain their point, they acquainted Antiochus that they were determined to renounce their old religion, and wholly conform themselves to that of the Greeks: which so pleased the tyrant, that he immediately gave them a force sufficient to drive Jason out of Jerusalem; who thereupon took refuge among the Ammonites.

9 Menelaus being thus freed from his rival, took care to fulfil his promise to the king with regard to the apostasy, but forgot to pay the money he had promised. At last he was summoned to Antioch; and finding nothing but the payment of the promised sum would do, sent orders to his brother Lyfimachus to convey to him as many of the sacred utensils belonging to the temple as could be spared. As these were all of gold, the apostate soon raised a sufficient sum from them not only to satisfy the king, but also to bribe the courtiers in his favour. But his brother Onias, who had been all this time confined at Antioch, getting intelligence of the sacrilege, made such bitter complaints, that an insurrection was ready to take place among the Jews at Antioch. Menelaus, in order to avoid the impending danger, bribed Andronicus, governor of the city, to murder Onias. This produced the most vehement complaints as soon as Antiochus returned to the capital (he having been absent for some time in order to quell an insurrection in Cilicia); which at last ended in the death of Andronicus, who was executed by the king's order. By dint of money, however, Menelaus still found means to keep up his credit; but was obliged to draw such large sums from Jerusalem, that the inhabitants at last massacred his brother Lyfimachus, whom he had left governor of the city in his absence. Antiochus soon after took a journey to Tyre; upon which the Jews sent deputies to him, both to justify the death of Lyfimachus, and to accuse Menelaus of being the author of all the troubles which had happened. The apostate, however, was never at a loss while he could procure money. By means of this powerful argument, he pleaded his cause so effectually, that the deputies were not only cast, but put to death; and this unjust sentence gave the traitor such a complete victory

over

Jews.

over all his enemies, that from thenceforth he commenced a downright tyrant. Jerusalem was destitute of protectors; and the sanhedrim, if there were any zealous men left among them, were so much terrified, that they durst not oppose him, though they evidently saw that his design was finally to eradicate the religion and liberties of his country.

In the mean time, Antiochus was taken up with the conquest of Egypt, and a report was some how or other spread that he had been killed at the siege of Alexandria. At this news the Jews imprudently showed some signs of joy; and Jason thinking this a proper opportunity to regain his lost dignity, appeared before Jerusalem at the head of about 1000 resolute men. The gates were quickly opened to him by some of his friends in the city; upon which Menelaus retired into the citadel, and Jason, minding nothing but his resentment, committed the most horrid butcheries. At last he was obliged to leave both the city and country, on the news that Antiochus was coming with a powerful army against him; for that prince, highly provoked at this rebellion, and especially at the rejoicings the Jews had made on the report of his death, had actually resolved to punish the city in the severest manner. Accordingly, about 170 B. C. having made himself master of the city, he behaved with such cruelty, that within three days they reckoned no fewer than 40,000 killed, and as many sold for slaves. In the midst of this dreadful calamity, the apostate Menelaus found means not only to preserve himself from the general slaughter, but even to regain the good graces of the king, who, having by his means plundered the temple of every thing valuable, returned to Antioch in a kind of triumph. Before he departed, however, he put Judea under the government of one Philip, a barbarous Phrygian; Samaria under that of Andronicus, a person of a similar disposition; and left Menelaus, the most hateful of all the three, in possession of the high-priesthood.

His mon-
strous
cruelty.

Though the Jews suffered exceedingly under these tyrannical governors, they were still reserved for greater calamities. About 168 B. C. Antiochus having been most severely mortified by the Romans, took it into his head to wreak his vengeance on the unhappy Jews. For this purpose he dispatched Apollonius at the head of 22,000 men, with orders to plunder all the cities of Judea, to murder all the men, and sell the women and children for slaves. Apollonius accordingly came with his army, and to outward appearance with a peaceable intention; neither was he suspected by the Jews, as he was superintendant of the tribute in Palestine. He kept himself inactive till the next sabbath, when they were all in a profound quiet; and then, on a sudden, commanded his men to arms. Some of them he sent to the temple and synagogues, with orders to cut in pieces all whom they found there; whilst the rest going through the streets of the city massacred all that came in their way; the superstitious Jews not attempting to make the least resistance for fear of breaking the sabbath. He next ordered the city to be plundered and set on fire, pulled down all their stately buildings caused the walls to be demolished, and carried away captive about 10,000 of those who had escaped the slaughter. From that time the service of the temple was totally abandoned; that place having

11
The temple
profaned
and the
Jewish re-
ligion abo-
lished.

been quite polluted, both with the blood of multitudes who had been killed, and in various other ways. The Syrian troops built a large fortress on an eminence in the city of David; fortified it with a strong wall and stately towers, and put a garrison in it to command the temple, over-against which it was built, so that the soldiers could easily see and fall upon all those who attempted to come into the temple; so many of whom were continually plundered and murdered by them, that the rest, not daring to stay any longer in Jerusalem, fled for refuge to the neighbouring nations.

Antiochus, not yet satiated with the blood of the Jews, resolved either totally to abolish their religion, or destroy their whole race. He therefore issued out a decree that all nations within his dominions should forsake their old religion and gods, and worship those of the king under the most severe penalties. To make his orders more effectual, he sent overseers into every province to see them strictly put in execution; and as he knew the Jews were the only people who would disobey them, special directions were given to have them treated with the utmost severity. Atheneas, an old and cruel minister, well versed in all the pagan rites, was sent into Judea. He began by dedicating the temple to Jupiter Olympius, and setting up his statue on the altar of burnt-offerings. Another lesser altar was raised before it, on which they offered sacrifices to that false deity. All who refused to come and worship this idol were either massacred or put to some cruel tortures till they either complied or expired under the hands of the executioners. At the same time, altars, groves, and statues, were raised everywhere through the country, and the inhabitants compelled to worship them under the same severe penalties; while it was instant death to observe the sabbath, circumcision, or any other institution of Moses.

At last, when vast numbers had been put to cruel death, and many more had saved their lives by their apostasy, an eminent priest, named *Mattathias*, began to signalize himself by his bravery and zeal for religion. He had for some time been obliged to retire to Modin his native place, in order to avoid the persecution which raged at Jerusalem. During his recess there, Apelles, one of the king's officers, came to oblige the inhabitants to comply with the above-mentioned orders. By him *Mattathias* and his sons were addressed in the most earnest manner, and had the most ample promises made them of the king's favour and protection if they would renounce their religion. But *Mattathias* answered, that though the whole Jewish nation, and the whole world, were to conform to the king's edict, yet both he and his sons would continue faithful to their God to the last minute of their lives. At the same time perceiving one of his countrymen just going to offer sacrifices to an idol, he fell upon him and instantly killed him, agreeable to the law of Moses in such cases. Upon this his sons, fired with the same zeal, killed the officer and his men; overthrew the altar and idol; and running about the city, cried out, that those who were zealous for the law of God should follow them; by which means they quickly saw themselves at the head of a numerous troop, with whom they soon after withdrew into some of the deserts of Judea. They were followed by many others, so that in a short time they found themselves in a condition to resist their enemies; and

Jews. and having considered the danger to which they were exposed by their scrupulous observance of the sabbath, they resolved to defend themselves, in case of an attack, upon that day as well as upon any other.

In the year 167 B. C. Mattathias finding that his followers daily increased in number, began to try his strength by attacking the Syrians and apostate Jews. As many of these as he took he put to death, but forced a much greater number to fly for refuge into foreign countries; and having soon struck his enemies with terror, he marched from city to city, overturned the idolatrous altars, opened the Jewish synagogues, made a diligent search after all the sacred books, and caused fresh copies of them to be written; he also caused the reading of the Scriptures to be resumed, and all the males born since the persecution to be circumcised. In all this he was attended with such success, that he had extended his reformation through a considerable part of Judea within the space of one year: and would probably have completed it, had he not been prevented by death.

13 exploits of Mattathias was Maccabees. Mattathias was succeeded by his son Judas, surnamed *Maccabees*, the greatest uninspired hero of whom the Jews can boast. His troops amounted to no more than 6000 men; yet with these he quickly made himself master of some of the strongest fortresses of Judea, and became terrible to the Syrians, Samaritans, and apostate Jews. In one year he defeated the Syrians in five pitched battles, and drove them quite out of the country; after which he purified the temple, and restored the true worship, which had been interrupted for three years and a half. Only one obstacle now remained, viz. the Syrian garrison above-mentioned, which had been placed over against the temple, and which Judas could not at present reduce. In order to prevent them from interrupting the worship, however, he fortified the mountain on which the temple stood, with a high wall and strong towers round about, leaving a garrison to defend it; making some additional fortifications at the same time to Bethzura, a fortress at about 20 miles distance.

14 reading of the history of Antiochus Epiphanes. In the mean time Antiochus being on his return from an unsuccessful expedition into Persia, received the disagreeable news that the Jews had all to a man revolted, defeated his generals, driven their armies out of Judea, and restored their ancient worship. This threw him into such a fury, that he commanded his charioteer to drive with the utmost speed, threatening utterly to extirpate the Jewish race, without leaving a single person alive. These words were scarce uttered, when he was seized with a violent pain in his bowels, which no remedy could cure or abate. But notwithstanding this violent shock, suffering himself to be hurried away by the transports of his fury, he gave orders for proceeding with the same precipitation in his journey. But while he was thus hastening forward, he fell from his chariot, and was so bruised by the fall, that his attendants were forced to put him into a litter. Not being able to bear even the motion of the litter, he was forced to halt at a town called *Tabæ* on the confines of Persia and Babylonia. Here he kept his bed, suffering inexpressible torments, occasioned chiefly by the vermin which bred in his body, and the stench, which made him insupportable even to himself. But the torments of his mind, caused by his reflecting

on the former actions of his life, surpassed by many degrees those of his body. Polybius, who in his account of this prince's death agrees with the Jewish historians, tells us, that the uneasiness of his mind grew at last to a constant delirium or state of madness, by reason of several spectres and apparitions of evil genii or spirits, which he imagined were continually reproaching him with the many wicked actions of which he had been guilty. At last, having languished for some time in this miserable condition, he expired, and by his death freed the Jews from the most inveterate enemy they had ever known.

Notwithstanding the death of Antiochus, however, the war was still carried on against the Jews; but through the valour and good conduct of Judas, the Syrians were constantly defeated, and in 163 B. C. a peace was concluded upon terms very advantageous to the Jewish nation. This tranquillity, however, was of no long continuance; the Syrian generals renewed their hostilities, and were attended with the same ill success as before. Judas defeated them in five engagements; but in the sixth was abandoned by all his men except 800, who, together with their chief, were slain in the year 161 B. C.

15 exploits of Jonathan, Simon, and Hyrcan. The news of the death of Judas threw his countrymen into the utmost consternation, and seemed to give new life to all their enemies. He was succeeded, however, by his brother Jonathan; who conducted matters with no less prudence and success than Judas had done, till he was treacherously seized and put to death by Tryphon, a Syrian usurper, who shortly after murdered his own sovereign. The traitor immediately prepared to invade Judea; but found all his projects frustrated by Simon, Jonathan's brother. This pontiff repaired all the fortresses of Judea, and furnished them with fresh garrisons, took Joppa and Gaza, and drove out the Syrian garrison from the fortress of Jerusalem; but was at last treacherously murdered by a son-in-law named *Ptolemy*, about 135 B. C.

Simon was succeeded by his son Hyrcan; who not only shook off the yoke of Syria, but conquered the Samaritans, demolished their capital city, and became master of all Palestine, to which he added the provinces of Samaria and Galilee; all which he enjoyed till within a year of his death, without the least disturbance from without, or any internal discord. His reign was no less remarkable on the account of his great wisdom and piety at home than his conquests abroad. He was the first since the captivity who had assumed the royal title; and he raised the Jewish nation to a greater degree of splendor than it had ever enjoyed since that time. The author of the fourth book of the *Maccabees* also informs us, that in him three dignities were centered which never met in any other person, namely, the royal dignity, the high-priesthood, and the gift of prophecy. But the instances given of this last are very equivocal and suspicious. The last year of his reign, however, was embittered by a quarrel with the Pharisees; and which proceeded such a length as was thought to have shortened his days. Hyrcan had always been a great friend to that sect, and they had hitherto enjoyed the most honourable employments in the state; but at length one of them, named *Eleazar*, took it into his head to question Hyrcan's legitimacy, alleging, that his mother had formerly been a slave,

^{Jews.} slave, and consequently that he was incapable of enjoying the high-priesthood. This report was credited, or pretended to be so, by the whole sect; which irritated the high-priest to such a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Pharisees, who therefore raised all the troubles and seditions they could during the short time he lived.

Hyrcan died in 107 B. C. and was succeeded by his eldest son Aristobulus, who conquered Iturea, but proved a most cruel and barbarous tyrant, polluting his hands with the blood even of his mother and one of his brothers, keeping the rest closely confined during his reign, which, however, was but short. He was succeeded in 105 by Alexander Jannæus, the greatest conqueror, next to King David, that ever sat on the Jewish throne. He was hated, however, by the Pharisees, and once in danger of being killed in a tumult excited by them; but having caused his guards to fall upon the mutinous mob, they killed 6000 of them, and dispersed the rest. After this, finding it impossible to remain in quiet in his own kingdom, he left Jerusalem, with a design to apply himself wholly to the extending of his conquests; but while he was busied in subduing his foreign enemies, the Pharisees raised a rebellion at home. This was quashed in the year 86 B. C. and the rebels were treated in the most inhuman manner. The faction, however, was by this means so thoroughly quelled, that they never dared to lift up their heads as long as he lived: and Alexander having made several conquests in Syria, died about 79 B. C.

The king left two sons, Hyrcanus and Aristobulus; but bequeathed the government to his wife Alexandra as long as she lived; but as he saw her greatly afraid, and not without reason, of the resentment of the Pharisees, he desired his queen, just before his death, to send for the principal leaders of that party, and pretend to be entirely devoted to them; in which case, he assured her, that they would support her and her sons after her in the peaceable possession of the government. With this advice the queen complied; but found herself much embarrassed by the turbulent Pharisees, who, after several exorbitant demands, would at last be contented with nothing less than the total extermination of their adversaries the Sadducees. As the queen was unable to resist the strength of the pharisaic faction, a most cruel persecution immediately took place against the Sadducees, which continued for four years; until at last, upon their earnest petition, they were dispersed among the several garrisons of the kingdom, in order to secure them from the violence of their enemies. A few years after this, being seized with a dangerous sickness, her youngest son Aristobulus collected a strong party in order to secure the crown to himself; but the queen being displeas'd with his conduct, appointed her other son Hyrcanus, whom she had before made high-priest, to succeed her also in the royal dignity. Soon after this she expired, and left her two sons competitors for the crown. The Pharisees raised an army against Aristobulus, which almost instantly deserted to him, so that Hyrcanus found himself obliged to accept of peace upon any terms; which, however, was not granted, till the latter had abandoned all title both to the royal and pontifical

dignity, and contented himself with the enjoyment of his peculiar patrimony as a private person.

But this deposition did not extinguish the party of Hyrcanus. A new cabal was raised by Antipater an Idumæan proselyte, and father of Herod the great; who carried off Hyrcanus into Arabia, under pretence that his life was in danger if he remained in Judea. Here he applied to Aretas king of that country, who undertook to restore the deposed monarch; and for that purpose invaded Judea, defeated Aristobulus, and kept him closely besieged in Jerusalem. The latter had recourse to the Romans; and having bribed Scaturus, one of their generals, he defeated Aretas with the loss of 7000 of his men, and drove him quite out of the country. The two brothers next sent presents to Pompey, at that time commander in chief of all the Roman forces in the east, and whom they made the arbitrator of their differences. But he, fearing that Aristobulus, against whom he intended to declare, might obstruct his intended expedition against the Nabatheans, dismissed them with a promise, that as soon as he had subdued Aretas, he would come into Judea and decide their controversy.

This delay gave such offence to Aristobulus, that he suddenly departed for Judea without even taking leave of the Roman general, who on his part was no less offended at this want of respect. The consequence was, that Pompey entered Judea with those troops with which he had designed to act against the Nabatheans, and summoned Aristobulus to appear before him. The Jewish prince would gladly have been excused; but was forced by his own people to comply with Pompey's summons, to avoid a war with that general. He came accordingly more than once or twice to him, and was dismissed with great promises and marks of friendship. But at last Pompey insisted, that he should deliver into his hands all the fortified places he possessed; which let Aristobulus plainly see that he was in the interest of his brother, and upon this he fled to Jerusalem with a design to oppose the Romans to the utmost of his power. He was quickly followed by Pompey; and to prevent hostilities was at last forced to go and throw himself at the feet of the haughty Roman, and to promise him a considerable sum of money as the reward of his forbearance. This submission was accepted; but Gabinius, being sent with some troops to receive the stipulated sum, was repulsed by the garrison of Jerusalem, who shut the gates against him, and refused to fulfil the agreement. This disappointment so exasperated Pompey, that he immediately marched with his whole army against the city.

The Roman general first sent proposals of peace; but finding the Jews resolved to stand out to the last, he began the siege in form. As the place was strongly fortified both by nature and art, he might have found it very difficult to accomplish his design, had not the Jews been suddenly seized with a qualm of conscience respecting the observance of the sabbath-day. From the time of the Maccabees they had made no scruple of taking up arms against an offending enemy on the sabbath; but now they discovered, that though it was lawful on that day to stand on their defence in case they were actually attacked, yet it was unlawful to do any thing towards the preventing of those pre-

paratives which the enemy made towards such future assaults. As therefore they never moved an hand to hinder the erection of mounds and batteries, or the making of breaches in the walls, on the sabbath, the besiegers at last made such a considerable breach on that day, that the garrison could no longer resist them. The city was therefore taken in the year 63 B. C. 12,000 of the inhabitants were slaughtered, and many more died by their own hands; while the priests, who were offering up the usual prayers and sacrifices in the temple, chose rather to be butchered along with their brethren, than suffer divine service to be one moment interrupted. At last, after the Romans had satiated their cruelty with the death of a vast number of the inhabitants, Hyrcanus was restored to the pontifical dignity with the title of *prince*; but forbid to assume the title of *king*, to wear a diadem, or to extend his territories beyond the limits of Judea. To prevent future revolts, the walls were pulled down; and Scarus was left governor with a sufficient force. But before he departed, the Roman general gave the Jews a still greater offence than almost any thing he had hitherto done; and that was by entering into the most sacred recesses of the temple, where he took a view of the golden table, candlestick, censers, lamps, and all the other sacred vessels; but, out of respect to the Deity, forebore to touch any of them, and when he came out commanded the priests immediately to purify the temple according to custom.

Pompey having thus subdued the Jewish nation, set out for Rome, carrying along with him Aristobulus and his two sons Alexander and Antigonus, as captives to adorn his future triumph. Aristobulus himself and his son Antigonus were led in triumph; but Alexander found means to escape into Judea, where he raised an army of 10,000 foot and 1500 horse, and began to fortify several strong-holds, from whence he made incursions into the neighbouring country. As for Hyrcanus, he had no sooner found himself freed from his rival brother, than he relapsed into his former indolence, leaving the care of all his affairs to Antipater, who, like a true politician, failed not to turn the weakness of the prince to his own advantage and the aggrandizing of his family. He foresaw, however, that he could not easily compass his ends, unless he ingratiated himself with the Romans; and therefore spared neither pains nor cost to gain their favour. Scarus soon after received from him a supply of corn and other provisions, without which his army, which he had led against the metropolis of Arabia, would have been in danger of perishing; and after this, he prevailed on the king to pay 300 talents to the Romans, to prevent them from ravaging his country. Hyrcanus was now in no condition to face his enemy Alexander; and therefore had again recourse to the Romans, Antipater at the same time sending as many troops as he could spare to join them. Alexander ventured a battle; but was defeated with considerable loss, and besieged in a strong fortress named *Alexandria*. Here he would have been forced to surrender; but his mother, partly by her address, and partly by the services she found means to do the Roman general, prevailed upon him to grant her son a pardon for what was past. The fortresses were then demolished, that they might not give occasion to fresh revolts; Hyrcanus

was again restored to the pontifical dignity; and the province was divided into five several districts, in each of which a separate court of judicature was erected. The first of these was at Jerusalem, the second at Gadara, the third at Amath, the fourth at Jericho, and the fifth at Sephoris in Galilee. Thus was the government changed from a monarchy to an aristocracy, and the Jews now fell under a set of domineering lords.

Soon after this, Aristobulus found means to escape from his confinement at Rome, and raised new troubles in Judea, but was again defeated and taken prisoner: his son also renewed his attempts; but was in like manner defeated, with the loss of near 10,000 of his followers; after which Gabinius, having settled the affairs of Judea to Antipater's mind, resigned the government of his province to Crassus. The only transaction during his government was his plundering the temple of all its money and sacred utensils, amounting in the whole to 10,000 Attic talents, i. e. above two millions of our money. After this sacrilege, Crassus set out on his expedition against Parthia, where he perished; and his death was by the Jews interpreted as a divine judgment for his impiety.

The war between Cæsar and Pompey afforded the Jews some respite, and likewise an opportunity of ingratiating themselves with the former, which the artful Antipater readily embraced. His services were rewarded by the emperor. He confirmed Hyrcanus in his priesthood, added to it the principality of Judea, to be entailed on his posterity for ever, and restored the Jewish nation to their ancient rights and privileges; ordering at the same time a pillar to be erected, whereon all these grants, and his own decree, should be engraved, which was accordingly done; and soon after, when Cæsar himself came into Judea, he granted liberty also to fortify the city, and rebuild the wall which had been demolished by Pompey.

During the lifetime of Cæsar, the Jews were so highly favoured, that they could scarcely be said to feel the Roman yoke. After his death, however, the nation fell into great disorders; which were not finally quelled till Herod, who was created king of Judea by Marc Antony in 40 B. C. was fully established on the throne by the taking of Jerusalem by his allies the Romans in 37 B. C. The immediate consequence of this was another cruel pillage and massacre: then followed the death of Antigonus the son of Aristobulus, who had for three years maintained his ground against Herod, put to death his brother Phasaël, and cut off Hyrcanus's ears, in order the more effectually to incapacitate him for the high-priesthood.

The Jews gained but little by this change of masters. The new king proved one of the greatest tyrants mentioned in history. He began his reign with a cruel persecution of those who had sided with his rival Antigonus; great numbers of whom he put to death, seizing and confiscating their effects for his own use. Nay, such was his jealousy in this last respect, that he caused guards to be placed at the city gates, in order to watch the bodies of those of the Antigonian faction who were carried out to be buried, lest some of their riches should be carried along with them. His jealousy next prompted him to decoy Hyrcanus, the banished pontiff, from Parthia, where he had taken

Jews.

refuge, that he might put him to death, though contrary to his most solemn promises. His cruelty then fell upon his own family. He had married Mariamne, the daughter of Hyrcanus; whose brother, Aristobulus, a young prince of great hopes, was made high-priest at the intercession of his mother Alexandra. But the tyrant, conscious that Aristobulus had a better right to the kingdom than himself, caused him soon after to be drowned in a bath. The next victim was his beloved queen Mariamne herself. Herod had been summoned to appear first before Marc Antony, and then before Augustus, in order to clear himself from some crimes laid to his charge. As he was, however, doubtful of the event, he left orders, that in case he was condemned, Mariamne should be put to death. This, together with the death of her father and brother, gave her such an aversion for him, that she showed it on all occasions. By this conduct the tyrant's resentment was at last so much inflamed, that having got her falsely accused of infidelity, she was condemned to die, and executed accordingly. She suffered with great resolution; but with her ended all the happiness of her husband. His love for Mariamne increased so much after her death, that for some time he appeared like one quite distracted. His remorse, however, did not get the better of his cruelty. The death of Mariamne was soon followed by that of her mother Alexandra, and this by the execution of several other persons who had joined with her in an attempt to secure the kingdom to the sons of the deceased queen.

Herod, having now freed himself from the greatest part of his supposed enemies, began to show a greater contempt for the Jewish ceremonies than formerly; and introduced a number of heathenish games, which made him odious to his subjects. Ten bold fellows at last took it into their heads to enter the theatre where the tyrant was celebrating some games, with daggers concealed under their clothes, in order to stab him or some of his retinue. In case they should miscarry in the attempt, they had the desperate satisfaction to think, that, if they perished, the tyrant would be rendered still more odious by the punishment inflicted on them. They were not mistaken: for Herod being informed of their design by one of his spies, and causing the assassins to be put to a most excruciating death, the people were so much exasperated against the informer, that they cut and tore him to pieces, and cast his flesh to the dogs. Herod tried in vain to discover the authors of this affront; but at last having caused some women to be put to the rack, he extorted from them the names of the principal persons concerned, whom he caused immediately to be put to death with their families. This produced such disturbances, that, apprehending nothing less than a general revolt, he set about fortifying Jerusalem with several additional works, rebuilding Samaria, and putting garrisons into several fortresses in Judea. Notwithstanding this, however, Herod had shortly after an opportunity of regaining the affections of his subjects in some measure, by his generosity to them during a famine; but as he soon relapsed into his former cruelty, their love was again turned into hatred, which continued till his death.

markable and magnificent of them all, however, was the temple at Jerusalem, which he is said to have raised to a higher pitch of grandeur than even Solomon himself had done. Ten thousand artificers were immediately set to work, under the direction of 1000 priests, the best skilled in carving, masonry, &c. all of whom were kept in constant pay. A thousand carts were employed in fetching materials; and such a number of other hands were employed, that every thing was got ready within the space of two years. After this, they set about pulling down the old building, and rearing up the new one with the same expedition: so that the *holy place*, or temple, properly so called, was finished in a year and a half; during which we are told that it never rained in the daytime, but only in the night. The remainder was finished in somewhat more than eight years. The *temple*, properly so called, or holy place, was but 60 cubits high, and as many in breadth; but in the front he added two wings or shoulders which projected 20 cubits more on each side, and which in all made a front of 120 cubits in length, and as many in height; with a gate 70 cubits high and 20 in breadth, but open and without any doors. The stones were white marble, 25 cubits in length, 12 in height, and 9 in breadth, all wrought and polished with exquisite beauty; the whole resembling a stately palace, whose middle being considerably raised above the extremities of each face, made it afford a beautiful vista at a great distance, to those who came to the metropolis. Instead of doors, the gates closed with very costly veils, enriched with a variety of flowering of gold, silver, purple, and every thing that was rich and curious; and on each side of the gates were planted two stately columns, from whose cornices hung golden festoons and vines, with their clusters of grapes, leaves, &c. curiously wrought. The superstructure, however, which was properly reared on the old foundation without sufficient additions, proved too heavy, and sunk down about 20 cubits; so that its height was reduced to 100. This foundation was of an astonishing strength and height, of which an account is given under the article JERUSALEM. The platform was a regular square of a stadium or furlong on each side. Each front of the square had a spacious gate or entrance, enriched with suitable ornaments; but that on the west had four gates, one of which led to the palace, another to the city, and the two others to the suburbs and fields. This inclosure was surrounded on the outside with a strong and high wall of large stones, well cemented; and on the inside had on each front a stately piazza or gallery, supported by columns of such a bigness, that three men could but just embrace them, their circumference being about 27 feet. There were in all 162 of them, which supported a cedar ceiling of excellent workmanship, and formed three galleries, the middlemost of which was the largest and highest, it being 45 feet in breadth and 100 in height, whereas those on each side were but 30 feet wide and 50 in height.

The piazzas and court were paved with marble of various colours; and, at a small distance from the galleries, was a second inclosure, surrounded with a flight of beautiful marble rails, with stately columns at proper distances, on which were engraven certain admonitions in Greek and Latin, to forbid strangers, and those

Jews.

Herod now, about 23 B. C. began to adorn his cities with many stately buildings. The most re-

^{Jews.} those Jews that were not purified, to proceed farther under pain of death. This inclosure had but one gate on the east side; none on the west; but on the north and south it had three, placed at equal distances from each other.

A third inclosure surrounded the temple, properly so called, and the altar of burnt-offerings; and made what they called *the court of the Hebrews or Israelites*. It was square like the rest: but the wall on the outside was surrounded by a flight of 14 steps, which hid a considerable part of it; and on the top was a terrace, of about 12 cubits in breadth, which went quite round the whole circumference. The east side had but one gate; the west none; and the north and south four, at equal distances. Each gate was ascended by five steps more before one could reach the level of the inward court; so that the wall which inclosed it appeared within to be but 25 cubits high, though considerably higher on the outside. On the inside of each of these gates were raised a couple of spacious square chambers, in form of a pavilion, 30 cubits wide and 40 in height, each supported by columns of 12 cubits in circumference.

This inclosure had likewise a double flight of galleries on the inside, supported by a double row of columns; but the western side was only one continued wall, without gates or galleries. The women had likewise their particular courts separate from that of the men, and one of the gates on the north and south leading to it.

The altar of burnt-offerings was likewise high and spacious, being 40 cubits in breadth, and 15 in height. The ascent to it was, according to the Mosaic law, smooth, and without steps; and the altar of unhewn stones. It was surrounded, at a convenient distance, with a low wall or rail, which divided the court of the priests from that of the lay Israelites; so that these last were allowed to come thus far to bring their offerings and sacrifices; though none but the priests were allowed to come within that inclosure.

Herod caused a new dedication of this temple to be performed with the utmost magnificence, and presented to it many rich trophies of his former victories, after the custom of the Jewish monarchs.

This, and many other magnificent works, however, did not divert the king's attention from his usual jealousies and cruelty. His sister Salome, and one of his sons named *Antipater*, taking advantage of this disposition, prompted him to murder his two sons by Mariamne, named *Alexander* and *Aristobulus*, who had been educated at the court of Augustus in Italy, and were justly admired by all who saw them. His cruelty soon after broke out in an impotent attempt to destroy the Saviour of the world, but which was attended with no other consequence than the destruction of 2000 innocent children of his own subjects. His misery was almost brought to its summit by the discovery of Antipater's designs against himself; who was accordingly tried and condemned for treason. Something still more dreadful, however, yet awaited him; he was seized with a most loathsome and incurable disease, in which he was tormented with intolerable pains, so that his life became a burden. At last he died, to the great joy of the Jews, five days after he had put Antipater to death, and after having divided his kingdom among his

sons in the following manner.—Archelaus had Judea; Antipas, or Herod, was tetrarch of Galilee and Perca; and Philip had the regions of Trachonitis, Gaulon, Batanea, and Pania, which he erected likewise into a tetrarchy. To his sister Salome he gave 50,000 pieces of money, together with the cities of Jamnia, Azotus, and Phasaelis; besides some considerable legacies to his other relations.

The cruelty of this monster accompanied him to his grave; nay, he in a manner carried it beyond the grave. Being well apprised that the Jews would rejoice at being freed from such a tyrant, he bethought himself of the following infernal stratagem to damp their mirth. A few days before his death, he summoned all the heads of the Jews to repair to Jericho under pain of death; and, on their arrival, ordered them all to be shut up in the circus, giving at the same time strict orders to his sister Salome and her husband to have all the prisoners butchered as soon as his breath was gone out. "By this means (said he), I shall not only damp the people's joy, but secure a real mourning at my death." These cruel orders, however, were not put in execution. Immediately after the king's death, Salome went to the Hippodrome, where the heads of the Jews were detained, caused the gates to be swung open, and declared to them, that now the king had no further occasion for their attendance, and that they might depart to their respective homes; after which, and not till then, the news of the king's death was published. Tumults, seditions, and insurrections, quickly followed. Archelaus was opposed by his brethren, and obliged to appear at Rome before Augustus, to whom many complaints were brought against him. After hearing both parties, the emperor made the following division of the kingdom: Archelaus had one half, under the title of *ethnarch*, or governor of a nation; together with a promise that he should have the title of *king*, as soon as he showed himself worthy of it. This ethnarchy contained Judea Propria, Idumea, and Samaria: but this last was exempted from one-fourth of the taxes paid by the rest, on account of the peaceable behaviour of the inhabitants during the late tumults. The remainder was divided between Philip and Herod; the former of whom had Trachonitis, Batanea, and Auranitis, together with a small part of Galilee; the latter had the rest of Galilee and the countries beyond the Jordan. Salome had half a million of silver, together with the cities of Jamnia, Azotus, Phasaelis, and Ascalon.

For some years Archelaus enjoyed his government in peace; but at last, both Jews and Samaritans, tired out with his tyrannical behaviour, joined in a petition to Augustus against him. The emperor immediately summoned him to Rome, where, having heard his accusation and defence, he banished him to the city of Vienne in Dauphiny, and confiscated all his effects, Judea being by this sentence reduced to a Roman province, was ordered to be taxed: and Cyrenius the governor of Syria, a man of consular dignity, was sent thither to see it put in execution: which having done, and sold the palaces of Archelaus, and seized upon all his treasure, he returned to Antioch, leaving the Jews in no small ferment on account of this new tax.

Jews.

Thus were the seeds of dissension sown between the Jews and Romans, which ended in the most lamentable catastrophe of the former. The Jews, always impatient of a foreign yoke, knew from their prophecies, that the time was now come when the Messiah should appear. Of consequence, as they expected him to be a great and powerful warrior, their rebellious and seditious spirit was heightened to the greatest degree; and they imagined they had nothing to do but take up arms, and victory would immediately declare on their side. From this time, therefore, the country was never quiet; and the infatuated people, while they rejected the true Messiah, gave themselves up to the direction of every impostor who chose to lead them to their own destruction. The governors appointed by the Romans were also frequently changed, but seldom for the better. About the 16th year of Christ, Pontius Pilate was appointed governor; the whole of whose administration, according to Josephus, was one continued scene of venality, rapine, tyranny, and every wicked action; of racking and putting innocent men to death, untried and uncondemned; and of every kind of savage cruelty. Such a governor was but ill calculated to appease the ferments occasioned by the late tax. Indeed Pilate was so far from attempting this, that he greatly inflamed them by taking every occasion of introducing his standards with images and pictures, consecrated shields, &c. into their city; and at last attempting to drain the treasury of the temple, under pretence of bringing an aqueduct into Jerusalem. The most remarkable transaction of his government, however, was his condemnation of JESUS CHRIST; seven years after which he was removed from Judea; and in a short time Agrippa, the grandson of Herod the Great, was promoted by Caius to the regal dignity. He did not, however, long enjoy this honour; for, on his coming into Judæa, having raised a persecution against the Christians, and blasphemously suffering himself to be styled a *God* by some deputies from Tyre and Sidon, he was miraculously struck with a disease, which soon put an end to his life. The sacred historian tells us, that he was eaten of worms; and Josephus, that he was seized with most violent pains in his heart and bowels; so that he could not but reflect on the baseness of those flatterers, who had but lately complimented him with a kind of divine immortality, that was now about to expire in all the torments and agonies of a miserable mortal.

29
The kingdom again
reduced to
a Roman
province.

On the death of Agrippa, Judea was once more reduced to a province of the Roman empire, and had new governors appointed over it. These were Ventidius, Felix, Festus Albinus, and Gessus Florus.— Under their government the Jewish affairs went on from bad to worse; the country swarmed with robbers and assassins; the latter committing everywhere the most unheard-of cruelties under the pretence of religion; and about 64 A. C. were joined by 18,000 workmen, who had been employed in further repairing and beautifying the temple. About this time also, Gessus Florus, the last and worst governor the Jews ever had, was sent into the country. Josephus seems at a loss for words to describe him by, or a monster to compare him to. His rapines, cruelties, conniving for large sums with the banditti, and in a word, his whole behaviour, was so open and barefaced, that he was looked upon by the Jews more like

a bloody executioner, sent to butcher, than a magistrate to govern, them. In this distracted state of the country, many of the inhabitants forsook it to seek for an asylum somewhere else; while those who remained applied themselves to Cestius Gallus, governor of Syria, who was at Jerusalem at the passover; beseeching him to pity their unhappy state, and free them from the tyranny of a man who had totally ruined their country. Florus, who was present when these complaints were brought against him, made a mere jest of them; and Cestius, instead of making a strict inquiry into his conduct, dismissed the Jews with a general promise that the governor should behave better for the future; and set himself about computing the number of Jews at that time in Jerusalem, by the number of lambs offered at that festival, that he might send an account of the whole to Nero. By his computation, there were at that time in Jerusalem 2,556,000; though Josephus thinks they rather amounted to 3,000,000.

In the year 67 began the fatal war with the Romans, which was ended only by the destruction of Jerusalem. The immediate cause was the decision of a contest with the Syrians concerning the city of Cæsarea. The Jews maintained that this city belonged to them, because it had been built by Herod; and the Syrians pretended that it had always been reckoned a Greek city, since even that monarch had reared temples and statues in it. The contest at last came to such an height, that both parties took up arms against each other. Felix put an end to it for a time, by sending some of the chiefs of each nation to Rome, to plead their cause before the emperor, where it hung in suspense till this time, when Nero decided it against the Jews. No sooner was this decision made public, than the Jews in all parts of the country flew to arms: and though they were everywhere the sufferers, yet, from this fatal period, their rage never abated. Nothing was now to be heard of but robberies, murders, and every kind of cruelty. Cities and villages were filled with dead bodies of all ages, even sucking babes. The Jews, on their part, spared neither Syrians nor Romans, where they got the better of them; and this proved the destruction of great numbers of their peaceful brethren: 20,000 were massacred at Cæsarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3500 at Jerusalem.

A great number of assassins, in the mean time, having joined the factious Jews in Jerusalem, they beat the Romans out of Antonia, a fortress adjoining to the temple, and another called *Massada*; and likewise out of the towers called *Phasaël* and *Mariamne*, killing all who opposed them. The Romans were at last reduced to such straits, that they capitulated on the single condition that their lives should be spared; notwithstanding which, they were all massacred by the furious zealots: and this treachery was soon revenged on the faithful Jews of Scythopolis. These had offered to assist in reducing their factious brethren; but their sincerity being suspected by the townsmen, they obliged them to retire into a neighbouring wood, where, on the third night, they were massacred to the number of 13,000, and all their wealth carried off. The rebels, in the mean time, crossed the Jordan, and took the fortresses of Macharon and

Jews.

The Jews
terribly
massacred

³² Jews. and Cyprus; which last they razed to the ground, after having put all the Romans to the sword.—This brought Cellius Gallus, the Syrian governor, into Judæa with all his forces; but the Jews, partly by treachery and partly by force, got the better of him, and drove him out of the country with the loss of 5000 men.

All this time such dreadful dissensions reigned among the Jews, that great numbers of the better sort foreseeing the sad effects of the resentment of the Romans, left the city as men do a sinking vessel; and the Christians, mindful of their Saviour's prediction, retired to Pella, a city on the other side of Jordan, whither the war did not reach. Miserable was the fate of such as either could not, or would not, leave that devoted city. Vespasian was now ordered to leave Greece, where he was at that time, and to march with all speed into Judæa. He did so accordingly at the head of a powerful army, ordering his son Titus in the mean time to bring two more legions from Alexandria; but before he could reach that country, the Jews had twice attempted to take the city of Ascalon, and were each time repulsed with the loss of 10,000 of their number. In the beginning of the year 68, Vespasian entered Galilee at the head of an army of 60,000 men, all completely armed and excellently disciplined. He first took and burnt Gadara: then he laid siege to Jotapa, and took it after a stout resistance; at which he was so provoked, that he caused every one of the Jews to be massacred or carried into captivity, not one being left to carry the dreadful news to their brethren. Forty thousand perished on this occasion: only 1200 were made prisoners, among whom was Josephus the Jewish historian. Japha next shared the same fate, after an obstinate siege; all the men being massacred, and the women and children carried into captivity. A week after this, the Samaritans, who had assembled on Mount Gerizzim, were almost all put to the sword, or perished. Joppa fell the next victim to the Roman vengeance. It had been formerly laid waste by Celsus; but was now repeopled and fortified by the seditious Jews who infested the country. It was taken by storm, and shared the same fate with the rest. Four thousand Jews attempted to escape by taking to their ships; but were driven back by a sudden tempest, and all of them were drowned or put to the sword. Tarichea and Tiberias were next taken, but part of their inhabitants were spared on account of their peaceable dispositions. Then followed the sieges of Gamala, Gischala, and Itabyr. The first was taken by storm, with a dreadful slaughter of the Jews; the last by stratagem. The inhabitants of Gischala were inclinable to surrender: but a seditious Jew of that town, named John, the son of Levi, head of the faction, and a vile fellow, opposed it; and, having the mob at his back, overawed the whole city. On the sabbath he begged of Titus to forbear hostilities till to-morrow, and then he would accept his offer; but instead of that, he fled to Jerusalem with as many as would follow him. The Romans, as soon as they were informed of his flight, pursued, and killed 6000 of his followers on the road, and brought back near 3000 women and children prisoners. The inhabitants then surrendered to Titus; and only the factious

were punished; and this completed the reduction of ^{Jews.} Galilee.

The Jewish nation by this time was divided into two very opposite parties: the one foreseeing that this war, if continued, must end in the total ruin of their country, were for putting an end to it by submitting to the Romans; the other, which was the remains of the faction of Judas Gaulonites, breathed nothing but war and confusion, and opposed all peaceable measures with invincible obstinacy. This last, which was by far the most numerous and powerful, consisted of men of the vilest and most profligate characters that can be paralleled in history. They were proud, ambitious, cruel, rapacious, and committed the most horrid and unnatural crimes under the mask of religion. They affirmed everywhere, that it was offering the greatest dishonour to God to submit to any earthly potentate; much less to Romans and to heathens. This, they said, was the only motive that induced them to take up arms, and to bind themselves under the strictest obligations not to lay them down till they had either totally extirpated all foreign authority, or perished in the attempt.—This dreadful dissension was not confined to Jerusalem, but had infected all the cities, towns, and villages, of Palestine. Even houses and families were so divided against each other, that, as our Saviour had expressly foretold, a man's greatest enemies were often those of his own family and household. In short, if we may believe Josephus, the zealots acted more like incarnate devils than like men who had any sense of humanity left them.—This obliged the contrary party likewise to rise up in arms in their own defence against those miscreants; from whom, however, they suffered much more than they did even from the exasperated Romans.—The zealots began their outrages by murdering all that opposed them in the countries round about. Then they entered Jerusalem; but met with a stout opposition from the other party headed by Ananus, who had lately been high-priest. A fierce engagement ensued between them; and the zealots were driven into the inner cincture of the temple, where they were closely besieged. John of Gischala above-mentioned, who had pretended to side with the peaceable party, was then sent with terms of accommodation; but, instead of advising the besieged to accept of them, he persuaded them still to hold out, and call the Idumeans to their assistance. They did so, and procured 20,000 of them to come to their relief; but these new allies were refused admittance into the city. On that night, however, there happened such a violent storm, accompanied with thunder, lightning, and an earthquake, that the zealots from within the inner court saw the bolts and hinges of the temple-gates without being heard, forced the guards of the besiegers, sallied into the city, and led in the Idumeans. The city was instantly filled with butcheries of the most horrid kind. Barely to put any of the opposite party to death was thought too mild a punishment: they must have the pleasure of murdering them by inches: so that they made it now their diversion to put them to the most exquisite tortures that could be invented; nor could they be prevailed upon to dispatch them till the violence of their torments had rendered them quite

³³ Vespasian sent against them.

³⁴ Different factions among the Jews.

³⁵ Cruelty of the zealots.

Jews.

quite incapable of feeling them. In this manner perished 12,000 persons of noble extraction, and in the flower of their age; till at last the Idumeans complained so much against the putting such numbers to death, that the zealots thought proper to erect a kind of tribunal, which, however, was intended not for judgment but condemnation: for the judges having once acquitted a person who was manifestly innocent, the zealots not only murdered him in the temple, but deposed the new-created judges as persons unfit for their office.

56
They turn
their arms
against each
other.

The zealots, after having exterminated all those of any character or distinction, began next to wreak their vengeance on the common people. This obliged many of the Jews to forsake Jerusalem, and take refuge with the Romans, though the attempt was very hazardous; for the zealots had all the avenues well guarded, and failed not to put to death such as fell into their hands. Vespasian in the mean time staid at Cesarea an idle spectator of their outrages; well knowing that the zealots were fighting for him, and that the strength of the Jewish nation was gradually wasting away. Every thing succeeded to his wish. The zealots, after having massacred or driven away the opposite party, turned their arms against each other. A party was formed against John, under one Simon who had his head-quarters at the fortrefs of Massada. This new miscreant plundered, burned, and massacred, wherever he came, carrying the spoil into the fortrefs above-mentioned. To increase his party, he caused a proclamation to be published, by which he promised liberty to the slaves, and proportionable encouragement to the freemen who joined him. This stratagem had the desired effect, and he soon saw himself at the head of a considerable army. Not thinking himself, however, as yet master of force sufficient to besiege Jerusalem, he invaded Idumea with 20,000 men. The Idumeans opposed him with 25,000; and a sharp engagement ensued, in which neither party was victorious. But Simon, soon after, having corrupted the Idumean general, got their army delivered up to him. By this means he easily became master of the country; where he committed such cruelties, that the miserable inhabitants abandoned it to seek for shelter in Jerusalem.

In the city, matters went in the same way. John tyrannized in such a manner, that the Idumeans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people, having taken a notion that he would sally out in the night and set fire to the city, called a council, in which it was resolved to admit Simon with his troops, in order to oppose John and his zealots. Simon's first attempt against his rival, however, was ineffectual, and he was obliged to content himself with besieging the zealots in the temple. In the mean time, the miseries of the city were increased by the starting up of a third party headed by one Eleazar, who seized on the court of the priests, and kept John confined within that of the Israelites. Eleazar kept the avenues so well guarded, that none were admitted to come into that part of the temple but those who came thither to offer sacrifices; and it was by these offerings chiefly that he maintained himself and his men. John by this means found himself hemmed in between two powerful enemies, Simon be-

I

Jews.

low, and Eleazar above. He defended himself, however, against them both with great resolution; and when the city was invested by the Romans, having pretended to come to an agreement with his rivals, he found means totally to cut off or force Eleazar's men to submit to him, so that the factions were again reduced to two.

The Romans, in the year 72, began to advance towards the capital. In their way they destroyed many thousands, wasting the country as they went along; and in the year 73 arrived before the walls of Jerusalem, under Titus afterwards emperor. As he was a man of an exceedingly merciful disposition, and greatly desired to spare the city, he immediately sent offers of peace; but these were rejected with contempt, and he himself put in great danger of his life, so that he resolved to begin the siege in form. In the mean time, Simon and John renewed their hostilities with greater fury than ever. John now held the whole temple, some of the out-parts of it, and the valley of Cedron. Simon had the whole city to range in; in some parts of which John had made such devastations, that they served them for a field of battle, from which they sallied unanimously against the common enemy whenever occasion served; after which they returned to their usual hostilities, turning their arms against each other, as if they had sworn to make their ruin more easy to the Romans. These drew still nearer to the walls, having with great labour and pains levelled all the ground between Scopas and them, by pulling down all the houses and hedges, cutting down the trees, and even cleaving the rocks that stood in their way, from Scopas to the tomb of Herod, and Bethara or the pool of serpents; in which work so many hands were employed, that they finished it in four days.

Whilst this was doing, Titus sent the besieged some offers of peace; and Josephus was pitched upon to be the messenger of them: but they were rejected with indignation. He sent a second time Nicanor and Josephus with fresh offers, and the former received a wound in his shoulder; upon which Titus resolved to begin the assault in good earnest, and ordered his men to raze the suburbs, cut down all the trees, and use the materials to raise platforms against the wall. Every thing was now carried on with invincible ardour; the Romans began to play their engines against the city with all their might. The Jews had likewise their machines upon the walls, which they plied with uncommon fury: they had taken them lately from Cestius: but were so ignorant in their use, that they did little execution with them, till they were better instructed by some Roman deserters: till then, their chief success was rather owing to their frequent sallies; but the Roman legions, who had all their towers and machines before them, made terrible havoc. The least stones they threw were near 100 weight; and these they could throw the length of a quarter of a mile against the city, and with such a force, that they could do mischief on those that stood at some distance behind them. Titus had reared three towers 50 cubits high; one of which happening to fall in the middle of the night, greatly alarmed the Roman camp, who immediately ran to arms at the noise of it; but Titus, upon knowing the cause, dismissed them, and caused it

it

^{Jews.} it to be set up again. These towers, being plated with iron, the Jews tried in vain to set fire to them, but were at length forced to retire out of the reach of their shot: by which the battering-rams were now at full liberty to play against the wall. A breach was soon made in it, at which the Romans entered: and the Jews, abandoning this last inclosure, retired behind the next. This happened about the 28th of April, a fortnight after the beginning of the siege.

John defended the temple and the castle of Antonia, and Simon the rest of the city. Titus marched close to the second wall, and plied his battering-rams so furiously, that one of the towers, which looked towards the north, gave a prodigious shake. The men who were in it, made a signal to the Romans, as if they would surrender; and, at the same time, sent Simon word to be ready to give them a warm reception. Titus, having discovered their stratagem, plied his work more furiously, whilst the Jews that were in the tower set it on fire, and flung themselves into the flames. The tower being fallen, gave them an entrance into the second inclosure, five days after gaining the first; and Titus, who was bent on saving the city, would not suffer any part of the wall or streets to be demolished; which left the breach and lanes so narrow, that when his men were furiously repulsed by Simon, they had not room enough to make a quick retreat, so that there was a number of them killed in it. This oversight was quickly rectified; and the attack renewed with such vigour, that the place was carried four days after their first repulse.

⁴⁰ The famine, raging in a terrible manner in the city, was soon followed by a pestilence; and as these two dreadful judgments increased, so did the rage of the factious, who, by their intestine feuds, had destroyed such quantities of provision, that they were forced to prey upon the people with the most unheard-of cruelty. They forced their houses; and, if they found any victuals in them, they butchered them for not appropriating them of it; and, if they found nothing but bare walls, which was almost everywhere the case, they put them to the most severe tortures, under pretence that they had some provision concealed. "I should (says Josephus) undertake an impossible task, were I to enter into a detail of all the cruelties of those impious wretches; it will be sufficient to say, that I do not think, that since the creation any city ever suffered such dreadful calamities, or abounded with men so fertile in all kinds of wickedness."

⁴¹ Titus, who knew their miserable condition, and was still willing to spare them, gave them four days to cool; during which he caused his army to be mustered, and provisions to be distributed to them in sight of the Jews, who flocked upon the walls to see it. Josephus was sent to speak to them afresh, and to exhort them not to run themselves into an inevitable ruin by obstinately persisting in the defence of a place which could hold out but a very little while, and which the Romans looked upon already as their own. But this stubborn people, after many bitter invectives, began to dart their arrows at him; at which, not at all discouraged, he went on with greater vehemence: but all the effect it wrought on them was, that it prevailed on great numbers to steal away privately to the

^{Jews.} Romans, whilst the rest became only the more desperate and resolute to hold out to the last, in spite of Titus's merciful offers.

To hasten therefore their destined ruin, he caused the city to be surrounded with a strong wall, to prevent either their receiving any succours or provision from abroad, or their escaping his resentment by flight. This wall, which was near 40 stadia or five miles in circuit, was yet carried on with such speed, and by so many hands, that it was finished in three days; by which one may guess at the ardour of the besiegers to make themselves masters of the city.

There was now nothing to be seen through the streets of Jerusalem but heaps of dead bodies rotting above ground, walking skeletons, and dying wretches. As many as were caught by the Romans in their sallies, Titus caused to be sacrificed in sight of the town, to strike terror among the rest: but the zealots gave it out, that they were those who fled to him for protection; which when Titus understood, he sent a prisoner with his hands cut off to undeceive, and assure them, that he spared all that voluntarily came over to him; which encouraged great numbers to accept his offers, though the avenues were closely guarded by the factious, who put all to death who were caught going on that errand. A greater mischief than that was, that even those who escaped safe to the Roman camp were miserably butchered by the soldiers, from a notion which these had taken that they had swallowed great quantities of gold; so that two thousand of them were ripped up in one night, to come at their supposed treasure. When Titus was apprised of this barbarity, he would have condemned all those butchering wretches to death; but they proved so numerous, that he was forced to spare them, and contented himself with sending a proclamation through his camp, that as many as should be suspected thenceforward of that horrid villainy should be put to immediate death: yet did not this deter many of them from it, only they did it more privately than before; so greedy were they of that bewitching metal. All this while the defection increased still more through the inhumanity of the faction within, who made the miseries and dying groans of their starving brethren the subject of their cruel mirth, and carried their barbarity even to the sheathing of their swords in sport in those poor wretches, under pretence of trying their sharpness.

When they found therefore that neither their guards nor severities could prevent the people's flight, they had recourse to another stratagem equally impious and cruel: which was, to hire a pack of vile pretenders to prophecy, to go about and encourage the despairing remains of the people to expect a speedy and miraculous deliverance; and this imposture proved a greater expedient with that infatuated nation than their other precautions.

⁴² Nothing could be more dreadful than the famished condition to which they were now reduced. The poor, having nothing to trust to but the Roman's mercy or a speedy death, ran all hazards to get out of the city; and if in their flight, and wandering out for herbs or any other sustenance, they fell into the hands of any of Titus's parties sent about to guard the avenues, they were numerically scourged, and crucified if they made the least resistance. The rich within the walls were

^{J-w.} now forced, though in the most private manner, to give half, or all they were worth, for a measure of wheat, and the middling sort for one of barley. This they were forced to convey into some private place in their houses, and to feed upon it as it was, without daring to pound or grind it, much less to boil or bake it, lest the noise or smell should draw the rapacious zealots to come and tear it from them. Not that these were reduced to any real want of provisions, but they had a double end in this barbarous plunder; to wit, the starving what they cruelly styled all useless persons, and the keeping their own stores in reserve. It was upon this sad and pinching juncture, that an unhappy mother was reduced to the extremity of butchering and eating her own child.

43
A mother
eats her
own child.

When this news was spread through the city, the horror and consternation were as universal as they were incredible. It was then that they began to think themselves forsaken by the Divine Providence, and to expect the most terrible effects of his anger against the poor remains of their nation; insomuch that they began to envy those that had perished before them, and to wish their turn might come before the sad expected catastrophe. Their fears were but too just; since Titus, at the very first hearing of this inhuman deed, swore the total extirpation of city and people. "Since (said he) they have so often refused my proffers of pardon, and have preferred war to peace, rebellion to obedience, and famine, such a dreadful one especially, to plenty, I am determined to bury that accursed metropolis under its ruins, that the sun may never shoot his beams on a city where the mothers feed on the flesh of their children, and the fathers, no less guilty than they, choose to drive them to such extremities, rather than lay down their arms."

44
Titus
swears the
total ruin
of the city.

The dreadful action happened about the end of July, by which time the Romans, having pursued their attacks with fresh vigour, made themselves masters of the fortress Antonia; which obliged the Jews to set fire to those stately galleries which joined it to the temple, lest they should afford an easy passage to the besiegers into this last. About the same time Titus, with much difficulty, got materials for raising new mounds and terraces, in order to hasten the siege, and save, if possible, the sad remains of that once glorious structure; but his pity proved still worse and worse bestowed on those obdurate wretches, who only became the more furious and desperate by it. Titus at length caused fire to be set to the gates, after having had a very bloody encounter, in which his men were repulsed with loss. The Jews were so terrified at it, that they suffered themselves to be devoured by the flames, without attempting either to extinguish them or save themselves. All this while Josephus did not cease exhorting the insatiated people to surrender, to represent to them the dreadful consequences of an obstinate resistance, and to assure them that it was out of mere compassion to them that he thus hazarded his own life to save theirs: he received one day such a wound in his head by a stone from the battlements, as laid him for dead on the ground. The Jews sallied out immediately, to have seized on his body: but the Romans proved too quick and strong for them, and

45
John plun-
ders the
temple.

carried him off. By this time the two factions within, but especially

^{J-w.} that of John, having plundered rich and poor of all they had, fell also on the treasury of the temple, whence John took a great quantity of golden vessels, together with those magnificent gifts which had been presented to that sacred place by the Jewish kings, by Augustus, Livia, and many other foreign princes, and melted them all to his own use. The repositories of the sacred oil which was to maintain the lamps, and of the wine which was reserved to accompany the usual sacrifices, were likewise seized upon, and turned into common use; and the last of this to such excess, as to make himself and his party drunk with it. All this while, not only the zealots, but many of the people, were still under such an insatiation, that though the fortress Antonia was lost, and nothing left but the temple, which the Romans were preparing to batter down, yet they could not persuade themselves that God would suffer that holy place to be taken by heathens, and were still expecting some sudden and miraculous deliverance. Even that vile monster John, who commanded there, either seemed confident of it, or else endeavoured to make them think him so. For, when Josephus was sent for the last time to upbraid his obstinately exposing that sacred building, and the miserable remains of God's people, to sudden and sure destruction, he only answered him with the bitterest invectives; adding, that he was defending the Lord's vineyard, which he was sure could not be taken by any human force. Josephus in vain reminded him of the many ways by which he had polluted both city and temple; and in particular of the seas of blood which he caused to be shed in both those sacred places, and which, he assured him from the old prophecies, were a certain sign and forerunner of their speedy surrender and destruction. John remained as inflexible as if all the prophets had assured him of a deliverance; till at length Titus, foreseeing the inevitable ruin of that stately edifice, which he was still extremely desirous to save, vouchsafed even himself to speak to them, and to persuade them to surrender. But the factious, looking upon this condescension as the effects of fear rather than generosity, only grew the more furious upon it, and forced him at last to come to those extremities which he had hitherto endeavoured to avoid. That his army, which was to attack the temple, might have the freer passage towards it through the castle Antonia, he caused a considerable part of the wall to be pulled down and levelled; which proved so very strong, that it took him up seven whole days, by which time they were far advanced in the month of July.

It was on the 17th day of that month, as all Josephus's copies have it, that the daily sacrifice ceased for the first time since its restoration by the brave Judas Maccabeus, there being no proper person left in the temple to offer it up. Titus caused the factious to be severely upbraided for it; exhorted John to set up whom he would to perform that office, rather than suffer the service of God to be set aside; and then challenged him and his party to come out of the temple, and fight on a more proper ground, and thereby save that sacred edifice from the fury of the Roman troops. When nothing could prevail on them, they began to set fire again to the gallery which formed a communication between the temple and the castle Antonia. The

Jews

Jews. Jews had already burnt about 20 cubits of it in length; but this second blaze, which was likewise encouraged by the besieged, consumed about 14 more; after which, they beat down what remained standing. On the 27th of July, the Jews, having filled part of the western portico with combustible matter, made a kind of flight; upon which, some of the forwardest of the Romans having scaled up to the top, the Jews set fire to it, which flamed with such sudden fury, that many of the former were consumed in it, and the rest, venturing to jump down from the battlements, were, all but one, crushed to death.

On the very next day, Titus having set fire to the north gallery, which inclosed the outer court of the temple, from Fort Antonia to the valley of Cedron, got an easy admittance into it, and forced the besieged into that of the priests. He tried in vain six days to batter down one of the galleries of that precinct with an helepolis: he was forced to mount his battering-rams on the terrace, which was raised by this time; and yet the strength of this wall was such, that it eluded the force of these also, though others of his troops were busy in sapping it. When they found that neither rams nor sapping could gain ground, they bethought themselves of scaling; but were vigorously repulsed in the attempt, with the loss of some standards, and a number of men. When Titus therefore found that his desire of saving that building was like to cost so many lives, he set fire to the gates, which, being plated with silver, burnt all that night, whilst the metal dropt down in the melting. The flame soon communicated itself to the porticoes and galleries; which the besieged beheld without offering to stop it, but contented themselves with sending whole volleys of impotent curses against the Romans. This was done on the eighth of August; and, on the next day, Titus, having given orders to extinguish the fire, called a council, to determine whether the remainder of the temple should be saved or demolished. That general was still for the former, and most of the rest declared for the latter; alleging, that it was no longer a temple, but a scene of war and slaughter, and that the Jews would never be at rest as long as any part of it was left standing: but when they found Titus stiffly bent on preserving so noble an edifice, against which he told them he could have no quarrel, they all came over to his mind. The next day, August the 10th, was therefore determined for a general assault: and the night before the Jews made two desperate sallies on the Romans; in the last of which, these, being timely succoured by Titus, beat them back into their inclosure.

But whether this last Jewish effort exasperated the besiegers, or, which is more likely, as Josephus thinks, pushed by the hand of Providence, one of the Roman soldiers, of his own accord, took up a blazing fire-brand, and, getting on his comrade's shoulders, threw it into one of the apartments that surrounded the sanctuary, through a window. This immediately set the whole north side in a flame up to the third story, on the same fatal day and month in which it had been formerly burnt by Nebuchadnezzar. Titus, who was gone to rest himself a while in his pavilion, was awaked at the noise, and ran immediately to give orders to have the fire extinguished. He called, prayed, threat-

ened, and even cared his men, but in vain; the confusion was so great, and the soldiers so obstinately bent upon destroying all that was left, that he was neither heard nor minded. Those that stocked thither from the camp, instead of obeying his orders, were busy, either in killing the Jews, or in increasing the flames. When Titus observed that all his endeavours were vain, he entered into the sanctuary and the most holy place, in which he found still such sumptuous utensils and other riches as even exceeded all that had been told him of it. Out of the former he saved the golden candlestick, the table of shew-bread, the altar of perfumes, all of pure gold, and the book or volume of the law, wrapped up in a rich gold tissue: but in the latter he found no utensils, because, in all probability, they had not made a fresh ark since that of Solomon had been lost. Upon his coming out of that sacred place, some other soldiers set fire to it, and obliged those that had itaid behind to come out; they all fell foul on the plunder of it, tearing even the gold plating off the gates and timber work, and carried off all the costly utensils, robes, &c. they found, insomuch that there was not one of them who did not enrich himself by it.

An horrid massacre followed soon after, in which a great many thousands perished; some by the flames, others by the fall from the battlements, and a greater number by the enemy's sword, which destroyed all it met with, without distinction of age, sex, or quality. Among them were upwards of 6000 persons who had been seduced thither by a false prophet, who promised them that they should find a speedy and miraculous relief there on that very day. Some of them remained five whole days on the top of the walls, and afterwards threw themselves on the general's mercy; but were answered that they had outstaid the time, and were led to execution. The Romans carried their fury to the burning of all the treasure-houses of the place, though they were full of the richest furniture, plate, vestments, and other things of value, which had been laid up in those places for security. In a word, they did not cease burning and butchering, till they had destroyed all, except two of the temple-gates, and that part of the court which was destined for the women.

In the mean time the seditious made such a vigorous push, that they escaped the fury of the Romans, at least for the present, and retired into the city. But here they found all the avenues so well guarded, that there was no possibility left for them to get out; which obliged them to secure themselves as well as they could on the south side of it, from whence Simon, and John of Gischala, sent to desire a parley with Titus. They were answered, that though they had been the cause of all this bloodshed and ruin, yet they should have their lives spared, if they laid down their arms and surrendered themselves prisoners. To this they replied, that they had engaged themselves, by the most solemn oaths, never to surrender; and therefore, only begged leave to retire into the mountains with their wives and children: which insolence so exasperated the Roman general, that he caused an herald to bid them stand to their defence; for that not one of them should be spared, since they had rejected his last offers of pardon. Immediately after this, he abandoned

on fire.

^{Jews} done the city to the fury of the soldiers, who fell forthwith on plundering, setting fire everywhere, and murdering all that fell into their hands; whilst the factious, who were left, went and fortified themselves in the royal palace, where they killed 8000 Jews who had taken refuge there.

In the mean time, great preparations were making for a vigorous attack on the upper city, especially on the royal palace; and this took them up from the 20th of August to the 7th of September, during which time great numbers came and made their submission to Titus. The warlike engines then played so furiously on the factious, that they were taken with a sudden panic; and, instead of fleeing to the towers of Hippicos, Phaiac, or Mariamne, which were yet untaken, and so strong that nothing but famine could have reduced them, they ran like madmen towards Sioah, with a design to have attacked the wall of circumvallation, and to have escaped out of the city; but, being there repulsed, they were forced to go and hide themselves in the public sinks and common sewers, some one way and some another. All whom the Romans could find were put to the sword, and the city was set on fire. This was on the eighth of September, when the city was taken and entered by Titus. He would have put an end to the massacre; but his men killed all, except the most vigorous, whom they shut up in the porch of the women just mentioned. Fronto, who had the care of them, reserved the youngest and most beautiful for Titus's triumph; and sent all that were above seventeen years of age into Egypt, to be employed in some public works there; and a great number of others were sent into several cities of Syria, and other provinces, to be exposed on the public theatre, to exhibit fights, or be devoured by wild beasts. The number of those prisoners amounted to 97,000, besides about 11,000 more, who were either starved through neglect, or starved themselves through fullness and despair.—The whole number of Jews who perished in this war is computed at upwards of 1,400,000.

Besides these, however, a vast number perished in caves, woods, wildernesses, common-sewers, &c. of whom no computation could be made. Whilst the soldiers were still busy in burning the remains of the city, and visiting all the hiding-places, where they killed numbers of poor creatures who had endeavoured to evade their cruelty, the two grand rebels Simon and John were found, and reserved for the triumph of the conqueror. John, being pinched with hunger, soon came out; and having begged his life, obtained it; but was condemned to perpetual imprisonment. Simon, whose retreat had been better stored, held out till the end of October. The two chiefs, with 700 of the handsomest Jewish captives, were made to attend the triumphal chariot; after which Simon was dragged through the streets with a rope about his neck, severely scourged, and then put to death; and John was sent into perpetual imprisonment.—Three castles still remained untaken, namely, Herodion, Macheron, and Massada. The two former capitulated; but Massada held out. The place was exceedingly strong both by nature and art, well stored with all kinds of provisions, and defended by a numerous gar-

rison of zealots; at the head of whom was one Eleazar, the grandson of Judas Gaulonites, formerly mentioned. The Roman general having in vain tried his engines and battering-rams against it, bethought himself of surrounding it with a high and strong wall, and then ordered the gates to be set on fire. The wind pushed the flames so fiercely against the Jews, that Eleazar in despair persuaded them first to kill their wives and children, and then to choose ten men by lot, who should kill all the rest; and lastly one out of the surviving ten to dispatch them and himself; only this last man was ordered to set fire to the place before he put an end to his own life. All this was accordingly done; and on the morrow, when the Romans were preparing to scale the walls, they were greatly surprised neither to see nor hear any thing move. On this they made such an hideous outcry, that two women, who had concealed themselves in an aqueduct, came forth and acquainted them with the desperate catastrophe of the besieged.

Thus ended the Jewish nation and worship; nor have they ever since been able to regain the smallest footing in the country of Judea, nor indeed in any other country on earth, though there is scarce any part of the globe where they are not to be found. They continue their vain expectations of a Messiah to deliver them from the low estate into which they are fallen; and, notwithstanding their repeated disappointments, there are few who can ever be persuaded to embrace Christianity. Their ceremonies and religious worship ought to be taken from the law of Moses; but they have added a multitude of absurdities not worth the inquiring after. In many countries, and in different ages, they have been terribly massacred, and in general have been better treated by the Mahometans and Pagans than by Christians. Since the revival of arts and learning, however, they have felt the benefit of that increase of humanity which has diffused itself almost over the globe. It is said, that in this country the life of a Jew was formerly at the disposal of the chief lord where he lived, and likewise all his goods. So strong also were popular prejudices and suspicions against them, that in the year 1348, a fatal endemic distemper raging in a great part of Europe, it was said that they had poisoned the springs and wells; in consequence of which a million and a half of them were cruelly massacred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. Edward I. did the same. In short, they were everywhere persecuted, oppressed, and most rigorously treated.

Jews
Jezides.

⁵¹
State of the
Jews since
the destruction
of
their city.

In this enlightened period a more generous system is followed. France has allowed them the rights of citizens, which induces numbers of the most wealthy Jews to fix their residence in that country. Poland granted them very great privileges and immunities; England, Holland, and Prussia tolerate and protect them; and the emperor has revoked some restrictions, for which an edict was passed: Spain, Portugal, and some of the Italian states, are still, however, it is said, averse to their dwelling among them.

JEZIDES, among the Mahometans; a term of similar import with heretics among Christians.

The Jezides are a numerous sect inhabiting Turkey and

Jezides
||
Iglaw.

and Persia, so called from their head Jezid, an Arabian prince, who slew the sons of Ali, Mahomet's father in law; for which reason he is reckoned a parricide, and his followers heretics. There are about 20,000 Jezides in Turkey and Persia; who are of two sorts, black and white. The white are clad like Turks: and distinguished only by their shirts, which are not slit at the neck like those of others, but have only a round hole to thrust their heads through. This is in memory of a golden ring, or circle of light, which descended from heaven upon the neck of their cheq, the head of their religion, after his undergoing a fast of forty days. The black Jezides, though married, are the monks or religious of the order; and these are called *Fakirs*.

The Turks exact excessive taxes from the Jezides, who hate the Turks as their mortal enemies; and when, in their wrath, they curse any creature, they call it *mussulman*: but they are great lovers of the Christians, being more fond of Jesus Christ than of Mahomet, and are never circumcised but when they are forced to it. They are extremely ignorant, and believe both the bible and the koran without reading either of them: they make vows and pilgrimages, but have no places of religious worship.

All the adoration they pay to God consists of some songs in honour of Jesus Christ, the virgin, Moses, and sometimes Mahomet; and it is a principal point of their religion never to speak ill of the devil, lest he should resent the injury, if ever he should come to be in favour with God again, which they think possible; whenever they speak of him, they call him the *aagel Peacock*. They bury their dead in the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. They go in companies like the Arabians, and change their habitations every 15 days. When they get wine, they drink it to excess; and it is said, that they sometimes do this with a religious purpose, calling it the blood of Christ. They buy their wives; and the market-price is 200 crowns for all women, handsome or not, without distinction.

JEZRAEL, or JEZREEL, a town in the north of Samaria, towards Mount Carmel, where stood a palace of the kings of Israel, (1 Kings xxi. 18). On the borders of Galilee (Joshua xix.) said to be one of the towns of Issachar.—The valley of Jezreel (Judges vi. 17.) was situated to the north of the town, running from west to east for ten miles, between two mountains; the one to the north, commonly called *Hermon*, near Mount Tabor; the other *Gilboa*: in breadth two miles.

IF, an island of France, in Provence, and the most eastern of the three before the harbour of Marseilles. It is very well fortified, and its port one of the best in the Mediterranean.

IGIS, a town of the country of the Grisons, in Caddea, with a magnificent castle, in which is a cabinet of curiosities, and a handsome library; 23 miles south-west of Choira, and 23 south of Glaris. E. Long. 9. o. N. Lat. 49. 10.

IGLAW, a considerable and populous town of Germany, in Moravia, where they have a manufactory of good cloth, and excellent beer. It is seated on the

river Iglaw, 40 miles west of Brin, and 62 south-east of Prague. E. Long. 15. 42. N. Lat. 47. 8.

IGNATIA, a genus of plants, belonging to the pentandria class. See BOTANY Index.

IGNATIUS LOYOLA, (canonized), the founder of the well-known order of the JESUITS, was born at the castle of Loyola, in Biscay, 1491; and became first page to Ferdinand V. king of Spain, and then an officer in his army. In this last capacity, he signalized himself by his valour; and was wounded in both legs at the siege of Pampeluna, in 1521. To this circumstance the Jesuits owe their origin; for, while he was under cure of his wound, a *Life of the Saints* was put into his hands, which determined him to forsake the military for the ecclesiastical profession. His first devout exercise was to dedicate himself to the blessed virgin as her knight: he then went a pilgrimage to the Holy Land; and on his return to Europe, he continued his theological studies in the universities of Spain, though he was then 33 years of age. After this he went to Paris; and in France laid the foundation of this new order, the institutes of which he presented to Pope Paul III. who made many objections to them, but at last in 1540 confirmed the institution. The founder died in 1555, and left his disciples two famous books; 1. Spiritual exercises; 2. Constitutions or rules of the order. But it must be remembered, that though these avowed institutes contain many privileges obnoxious to the welfare of society, the most diabolical are contained in the private rules, intitled *Monita secreta*, which were not discovered till towards the close of the last century; and most writers attribute these, and even the Constitutions, to Laynez, the second general of the order.

IGNATIUS, St, surnamed *Theophrastus*, one of the apostolical fathers of the church, was born in Syria, and educated under the apostle and evangelist St John, and intimately acquainted with some other of the apostles, especially St Peter and St Paul. Being fully instructed in the doctrines of Christianity, he was, for his eminent parts and piety, ordained by St John, and confirmed about the year 67 bishop of Antioch, by these two apostles, who first planted Christianity in that city, where the disciples also were first called *Christians*. Antioch was then not only the metropolis of Syria, but a city the most famous and renowned of any in the east, and the ancient seat of the Roman emperors, as well as of the viceroys and governors. In this important seat he continued to sit somewhat above 40 years, both an honour and safeguard of the Christian religion, till the year 107, when Trajan the emperor, flushed with a victory which he had lately obtained over the Scythians and Daci, about the ninth year of his reign, came to Antioch to make preparations for a war against the Parthians and Armenians. He entered the city with the pomp and solemnities of a triumph; and, as his first care usually was about the concerns of religion, he began presently to inquire into that affair. Christianity had by this time made such a progress, that the Romans grew jealous and uneasy at it. This prince, therefore, had already commenced a persecution against the Christians in other parts of the empire, which he now resolved to carry on here. However, as he was naturally of a

Ignatius
Ignatius

Ignatius mild disposition, though he ordered the laws to be put in force against them if convicted, yet he forbade them to be fought after.

In this state of affairs, Ignatius, thinking it more prudent to go himself than stay to be sent for, of his own accord presented himself to the emperor; and, it is said, there passed a long and particular discourse between them, wherein the emperor expressing a surprise how he dared to transgress the laws, the bishop took the opportunity to assert his own innocency, and to explain and vindicate his faith and freedom. The issue of this was, that he was cast into prison, and this sentence passed upon him, That, being incurably overrun with superstition, he should be carried bound by soldiers to Rome, and there thrown as a prey to wild beasts.

He was first conducted to Seleucia, a port of Syria, at about 16 miles distance, the place where Paul and Barnabas set sail for Cyprus. Arriving at Smyrna in Ionia, he went to visit Polycarp bishop of that place, and was himself visited by the clergy of the Asian churches round the country. In return for that kindness, he wrote letters to several churches, as the Ephesians, Magnesians, and Trallians, besides the Romans, for their instruction and establishment in the faith; one of these was addressed to the Christians at Rome, to acquaint them with his present state, and passionate desire not to be hindered in the course of martyrdom which he was now hastening to accomplish.

His guard, a little impatient of their stay, set sail with him for Troas, a noted city of the lesser Phrygia, not far from the ruins of old Troy; where, at his arrival, he was much refreshed with the news he received of the persecution ceasing in the church of Antioch: hither also several churches sent their messengers to pay their respects to him; and hence too he dispatched two epistles, one to the church of Philadelphia, and the other to that of Smyrna; and, together with this last, as Eusebius relates, he wrote privately to Polycarp, recommending to him the care and inspection of the church of Antioch.

From Troas they sailed to Neapolis, a maritime town in Macedonia; thence to Philippi, a Roman colony, where they were entertained with all imaginable kindness and courtesy, and conducted forwards on their journey, passing on foot through Macedonia and Epirus, till they came to Epidamnium, a city of Dalmatia: where again taking shipping, they sailed through the Adriatic, and arrived at Rhegium, a port-town in Italy; directing their course thence through the Tyrrhenian sea to Puteoli, whence Ignatius desired to proceed by land, ambitious to trace the same way by which St Paul went to Rome: but this wish was not complied with; and, after a stay of 24 hours, a prosperous wind quickly carried them to the Roman port, the great harbour and station for their navy, built near Ostia, at the mouth of the Tyber, about 16 miles from Rome; whither the martyr longed to come, as much desirous to be at the end of his race, as his keepers, weary of their voyage, were to be at the end of their journey.

The Christians at Rome, daily expecting his arrival, were come out to meet and entertain him, and accordingly received him with a mixture of joy and sorrow;

but when some of them intimated, that possibly the populace might be taken off from desiring his death, he expressed a pious indignation, intreating them to cast no rubs in his way, nor do any thing that might hinder him, now he was hastening to his crown. There are many such expressions as this in his epistle to the Romans, which plainly show that he was highly ambitious of the crown of martyrdom. Yet it does not appear that he rashly sought or provoked danger. Among other expressions of his ardour for suffering, he said, that the wild beasts had feared and refused to touch some that had been thrown to them, which he hoped would not happen to him. Being conducted to Rome, he was presented to the præfect, and the emperor's letters probably delivered concerning him. The interval before his martyrdom was spent in prayers for the peace and prosperity of the church. That his punishment might be the more pompous and public, one of their solemn festivals, the time of their Saturnalia, and that part of it when they celebrated their Sigillaria, was pitched on for his execution; at which time it was their custom to entertain the people with the bloody conflicts of gladiators, and the hunting and fighting with wild beasts. Accordingly, on the 13th kal. January, i. e. December 20. he was brought out into the amphitheatre, and the lions being let loose upon him, quickly dispatched their meal, leaving nothing but a few of the hardest of his bones. These remains were gathered up by two deacons who had been the companions of his journey; and being transported to Antioch, were interred in the cemetery, without the gate that leads to Daphne; whence, by the command of the emperor Theodosius, they were removed with great pomp and solemnity to the Tycheon, a temple within the city, dedicated to the public genius of it, but now consecrated to the memory of the martyr.

St Ignatius stands at the head of those Antinicean fathers, who have occasionally delivered their opinions in defence of the true divinity of Christ, whom he calls the *Son of God, and his eternal world*. He is also reckoned the great champion of the doctrine of the episcopal order, as distinct and superior to that of priest and deacon. And one, the most important, use of his writings respects the authenticity of the Holy Scriptures, which he frequently alludes to, in the very expressions as they stand at this day.—Archbishop Uther's edition of his works, printed in 1647, is thought the best: yet there is a fresher edition extant at Amsterdam, where, beside the best notes, there are the dissertations of Uther and Pearson.

St IGNATIUS'S Bean, the fruit of a plant. See *IGNATIA*, *BOTANY Index*.

IGNIS-FATUUS, a kind of light, supposed to be of an electric nature, appearing frequently in mines, marshy places, and near stagnating waters. It was formerly thought, and is still by the superstitious believed, to have something ominous in its nature, and to presage death and other misfortunes. There have been instances of people being decoyed by these lights into marshy places, where they have perished; whence the names of *Ignis-fatuus*, *Will-with-a-wisp*, and *Jack-with-a-lantern*, as if this appearance was an evil spirit which took delight in doing mischief

Ignatius
Ignis-
fatuus.

of that kind. For a further account of the nature and properties of the ignis-fatuus, see METEOROLOGY *Index*.

IGNITION, properly signifies the setting fire to any substance; the sense is sometimes limited to that kind of burning which is not accompanied with flame, such as that of charcoal, cinders, metals, stones, and other solid substances. The effects of ignition, according to the old chemical doctrine, are first to dissipate what is called the *phlogiston* of the ignited substance, after which it is reduced to ashes. Vitrification next follows; and lastly, the substance is totally dissipated in vapour. All these effects, however, depend on the presence of the air; for *in vacuo* the phlogiston of any substance cannot be dissipated. Neither can a body which is totally destitute of phlogiston be ignited in such a manner as those which are not deprived of it: for as long as the phlogiston remains, the heat is kept up in the body by the action of the external air upon it; but when the phlogiston is totally gone, the air always destroys, instead of augmenting, the heat. But for the explanation of the phenomena of ignition, according to the views of modern chemistry, see **IGNITION**, *CHEMISTRY Index*.

IGNOBILES, amongst the Romans, was the designation of such persons as had no right of using pictures and statues. See *Jus Imaginis*.

IGNOMINIA, a species of punishment amongst the Romans, whereby the offender suffered public shame, either by virtue of the prætor's edict, or by order of the censor. This punishment, besides the scandal, deprived the party of the privilege of bearing any offices, and almost all other liberties of a Roman citizen.

IGNORAMUS, in *Law*, is a word properly used by the grand inquest empannelled in the inquisition of causes criminal and public, and written upon the bill whereby any crime is offered to their consideration, when, as they dislike their evidence as defective or too weak to make good the presentment; the effect of which word so written is, that all farther inquiry upon that party for that fault is thereby stopped, and he delivered without farther answer. It hath a resemblance with that custom of the ancient Romans, where the judges, when they absolved a person accused, did write *A.* upon a little table provided for that purpose, i. e. *absolvimus*; if they judged him guilty, they wrote *C. i. e. condemnamus*; if they found the cause difficult and doubtful, they wrote *N. L. i. e. non liquet*.

IGNORANCE, the privation or absence of knowledge. The causes of ignorance, according to Locke, are chiefly these three. 1. Want of ideas. 2. Want of a discoverable connection between the ideas we have. 3. Want of tracing and examining our ideas. See **METAPHYSICS**.

IGNORANCE, in a more particular sense, is used to denote illiteracy. Previous to the taking of Rome by the Gauls, such gross ignorance prevailed among the Romans that few of the citizens could read or write, and the alphabet was almost unknown. During three ages there were no public schools, but the little learning their children had was taught them by their parents; and how little that was may be partly concluded from this circumstance, that a nail was usually driven into the wall of the temple of *Jupiter Capitolinus*, on the 15th of September, to assist the ignorance of the people in reckon-

ing the years, because they were unacquainted with letters or figures. The driving of the nail was afterwards converted into a religious ceremony, and performed by the *dictator*, to avert public calamities.

IGNORANCE, or *mistake*, in *Law*, a defect of will, whereby a person is excused from the guilt of a crime, when, intending to do a lawful act, he does that which is unlawful. For here the deed and the will acting separately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or mistake of fact, and not an error in point of law. As if a man intending to kill a thief or house-breaker in his own house, by mistake kills one of his own family, this is no criminal action: but if a man thinks he has a right to kill a person excommunicated or outlawed wherever he meets him, and does so; this is wilful murder. For a mistake in point of law, which every person of discretion not only may, but is bound and presumed to know, is, in criminal cases, no sort of defence. *Ignorantia juris quod quisque tenetur scire, neminem excusat*, is as well the maxim of our own law as it was of the Roman.

IGUANA, a species of LACERTA. See **ERPETOLOGY Index**.

Mud IGUANA, a species of fish. See **MURENA**, *ICHTHYOLOGY Index*.

IHOR, **JOHOR**, or *Jor*, a town of Asia, in Malacca, and capital of a province of the same name in the peninsula beyond the Ganges. It was taken by the Portuguese in 1603, who destroyed it, and carried off the cannon; but it has since been rebuilt, and was afterwards in possession of the Dutch. E. Long. 93. 55. N. Lat. 1. 15.

JIB, the foremost sail of a ship, being a large stay-sail extended from the outer end of the bowsprit prolonged by the jib-boom, towards the fore-top mast head. See **SAIL**.

The jib is a sail of great command with any side-wind, but especially when the ship is *close hauled*, or has the wind upon her beam; and its effort in *casting* the ship, or turning her head to leeward, is very powerful, and of great utility, particularly when the ship is working through a narrow channel.

Jib-Boom, a boom run out from the extremity of the bowsprit, parallel to its length, and serving to extend the bottom of the jib, and the stay of the fore-top-gallant mast. This boom, which is nothing more than a continuation of the bowsprit forward, to which it may be considered as a top-mast, is usually attached to the bowsprit by means of two large boom-irons, or by one boom-iron, and a cap on the outer end of the bowsprit; or, finally, by the cap without and a strong lashing within, instead of a boom-iron, which is generally the method of securing it in small merchant-ships. It may therefore be drawn in upon the bowsprit as occasion requires; which is usually practised when the ship enters a harbour, where it might very soon be broken or carried away, by the vessels which are moored therein, or passing by under sail.

JIBBEL or **GEBBEL AUREY**, the Mons Aurarius of the middle age, an assemblage of many very rocky mountains in Africa, in the kingdom of Algiers. Here Mr Bruce met with a race of people much fairer in the complexion than any of the nations to the southward of Britain: their hair was red, and their eyes blue: they

Iguana
||
Jibbel
Aurey.

Jidda.

maintain their independence, and are of a savage disposition, so that our traveller found it difficult to approach them with safety. They are called Nearchia; and each of them has a Greek cross in the middle between the eyes, marked with antimony. They are divided into tribes, but, unlike the other Arabs, have huts in the mountains built of mud and straw; and are, by our author, supposed to be a remnant of the Vandals. He even thinks that they may be descended from the remainder of an army of Vandals mentioned by Procopius, which was defeated among these mountains. They live in perpetual war with the Moors, and boast that their ancestors were Christians. They pay no taxes.

JIDDA, a town of Arabia, situated, according to Mr Bruce, in N. Lat. $28^{\circ} 0' 1''$, E. Long. $39^{\circ} 16' 55''$, while others make it $21^{\circ} 28'$, and E. Long. $39^{\circ} 22'$. It is situated in a very unwholesome, barren, and desert part of the country. Immediately without the gate to the eastward is a desert plain filled with the kuts of the Bedouens or country Arabs, built of long bundles of spartum or bent-grass put together like fascines. These people supply the town with milk and butter. "There is no stirring out of the town (says Mr Bruce) even for a walk, unless for about half a mile on the south side by the sea, where there is a number of stinking pools of stagnant water, which contributes to make the town very unwholesome."

From the disagreeable and inconvenient situation of this port, it is probable, that it would have been long ago abandoned, had it not been for its vicinity to Mecca, and the vast annual influx of wealth occasioned by the India trade; which, however, does not continue, but passes on to Mecca, whence it is dispersed all over the east. The town of Jidda itself receives but little advantage, for all the customs are immediately sent to the needy and rapacious Sheriff of Mecca and his dependents. "The gold (says Mr Bruce) is returned in bags and boxes, and passes on as rapidly to the ships as the goods do to the market, and leaves as little profit behind. In the mean time provisions rise to a prodigious price, and this falls upon the townsmen, while all the profit of the traffic is in the hands of strangers; most of whom, after the market is over (which does not last six weeks), retire to Yemen and other neighbouring countries, which abound in every sort of provision.

From this scarcity, Mr Bruce supposes it is that polygamy is less common here than in any other part of Arabia. "Few of the inhabitants of Jidda (says our author) can avail themselves of the privilege granted by Mahomet. He cannot marry more than one wife, because he cannot maintain more; and from this cause arises the want of people and the number of unmarried women."

The trade at Jidda is carried on in a manner which appeared very strange to our traveller. "Nine ships (says he) were there from India; some of them worth, I suppose 200,000*l*. One merchant, a Turk, living at Mecca, 30 hours journey off, where no Christian dares go, whilst the continent is open to the Turk for escape, offers to purchase the cargoes of four out of these nine ships himself; another of the same cast comes and says he will buy none unless he has them all. The samples are shown, and the cargoes of the

whole nine ships are carried into the wildest parts of Arabia by men with whom one would not wish to trust himself alone in the field. This is not all; two India brokers come into the room to settle the price; one on the part of the India captain, the other on that of the buyer the Turk. They are neither Mahometans nor Christians, but have credit with both. They sit down on the carpet, and take an India shawl which they carry on their shoulder like a napkin, and spread it over their hands. They talk in the mean time indifferent conversation, as if they were employed in no serious business whatever. After about 20 minutes spent in handling each others fingers below the shawl, the bargain is concluded, say for nine ships, without one word ever having been spoken on the subject, or pen or ink used in any shape whatever. There never was one instance of a dispute happening in these sales. But this is not all; the money is yet to be paid. A private Moor, who has nothing to support him but his character, becomes responsible for the payment of these cargoes. This man delivers a number of coarse hempen bags full of what is supposed to be money. He marks the contents upon the bag, and puts his seal upon the string that ties the mouth of it. This is received for what is marked upon it without any one ever having opened one of the bags; and in India it is current for the value marked upon it as long as the bag lasts.

The port of Jidda is very extensive, and contains numberless shoals, small islands, and sunk rocks, with deep channels, however, between them; but in the harbour itself ships may ride secure, whatever wind blows. The only danger is in the coming in or going out; but as the pilots are very skilful, accidents are never known to happen. The charts of this harbour, as Mr Bruce informs us, are exceedingly erroneous. While he staid here, he was desired by Captain Thornhill to make a new chart of the harbour; but finding that it had been undertaken by another gentleman, Captain Newland, he dropped it. He argues in the strongest terms against the old maps, which he says can be of no use, but the contrary; and he gives it as a characteristic of the Red sea, "scarce to have soundings in any part of the channel, and often on both sides; whilst ashore, soundings are hardly found a boat length from the main. To this, says he, I will add, that there is scarce one island on which I ever was, where the bowspirit was not over the land, while there were no soundings by a line heaved over the stern. Of all the vessels in Jidda, only two had their log-lines properly divided, and yet all were so fond of their supposed accuracy, as to aver they had kept their course within five leagues between India and Babelmandel. Yet they had made no estimation of the currents without the straits, nor the different very strong ones soon after passing Socotra; their half-minute glasses, upon a medium, ran 57 seconds; they had made no observations on the tides or currents in the Red sea, either in the channel or in the inward passage; yet there is delineated in this map a course of Captain Newland's, which he kept in the middle of the channel, full of sharp angles and short stretches; you would think every yard was measured and sounded!"

JILLIFRE²,

Jidda.
Fig.

JILLIFREE, a town on the northern bank of the river Gambia, opposite to James's island, where the English had formerly a small port. The kingdom of Barra, in which it is situated, produces abundance of the necessaries of life; but the chief trade of the inhabitants is in salt, which they carry up the river in canoes; and, in return, bring down Indian corn, cotton-cloths, elephants teeth, small quantities of gold dust, &c. The number of canoes and people continually employed in this trade, make the king of Barra, according to Mr Park, more formidable to Europeans, than any other chieftain on the river, and have encouraged him to establish those extravagant duties, which traders of all nations are obliged to pay at entry, amounting almost to 20l. on each vessel, great and small. These duties are commonly collected in person by the governor of Jillifree, who is attended by a troublesome train of dependants, who have some knowledge of the English language, in consequence of their intercourse with them, and beg with such importunity, that traders are often under the necessity of complying with their demands, in order to get rid of them. N. Lat. 13. 16. W. Long. 16. 10. from Greenwich.

JIN. See GENII.

IKENILD STREET, one of the four famous ways which the Romans made in England, called *Stratum Icenorum*, because it began in the country of the *Iceni*, who inhabited Norfolk, Suffolk, and Cambridgeshire.

ILA, ILAY, or *Isla*, one of the chief of the Hebrides or Western isles of Scotland, lying to the west of Jura, from which it is separated by a narrow channel. It extends 24 miles in length from north to south, and is 18 in breadth from east to west. On the east side there are many lofty sterile mountains; but in the interior, and to the southward and westward, the land is in good cultivation. A great body of limestone of a bluish colour lying in the middle part of the island, stretches almost through its whole length, and is now extensively employed for the purposes of manure. Marl, which is also abundant, is applied to the same use. Lead-ore has been dug out in several places, and at so early a period as the time of the Danes. The principal harbour in Isla is at Lochindaal, but there are several others which are safe and commodious. Here are several rivers and lakes well stored with trout, eels, and salmon. In the centre is Loch Finlagan, about three miles in circuit, with the little isle of that name in the middle. Here the great lord of the isles once resided in all the pomp of royalty; but his palaces and offices are now in ruins. Instead of a throne, Macdonald stood on a stone seven feet square, in which there was an impression made to receive his feet; here he was crowned and anointed by the bishop of Argyle and seven inferior priests, in presence of the chieftains. This stone still exists. The ceremony (after the new lord had collected his kindred and vassals) was truly patriarchal. After putting on his armour, his helmet, and his sword, he took an oath to rule as his ancestors

had done; that is, to govern as a father would his children: his people in return swore that they would pay the same obedience to him as children would to their parent. The dominions of this potentate, about the year 1586, consisted only of Ilay, Jura, Knapdale, and Cantyre: so reduced were they from what they had been before the deprivation of the great earl of Ross in the reign of James III. Near this is another little isle, where he assembled his council, *Ilan na Corlle*, or "the island of council;" where 13 judges constantly sat to decide differences among his subjects; and received for their trouble the 11th part of the value of the affair tried before them. In the first island were buried the wives and children of the lords of the isles; but their own persons were deposited in the more sacred ground of Iona. On the shores of the lake are some marks of the quarters of his *Carnauch* and *Gilli-glasser*, "the military of the isles;" the first signifying a strong man, the last a grim-looking fellow. The first were light-armed, and fought with darts and daggers; the last with sharp hatchets. These are the troops that Shakespeare alludes to, when he speaks of a Donald, who

Da.

————— From the Western isles
Of Kernes and Gallow-glasses was supplied.

Besides those already mentioned, the lords had a house and chapel at Laggan, on the south side of Lochindaal: a strong castle on a rock in the sea, at Dunowalk, at the south-east end of the country; for they made this island their residence after their expulsion from that of Man in 1304.—There is a tradition, that while the isle of Man was part of the kingdom of the isles, the rents were for a time paid in this country: those in silver were paid on a rock, still called *Creig-a-nione*, or "the rock of the silver rent;" the other, *Creig-a-naig'id*, or "the rock of rents in kind." These lie opposite to each other, at the mouth of a harbour on the south side of this island. There are several forts built on the isles in fresh water lakes, and divers caverns in different parts of the island, which have been used occasionally as places of strength. The island is divided into four parishes, viz. Kildalton, Killarow, Kilchoman, and Kilmenie. The produce is corn of different kinds; such as bear, which sometimes yields eleven fold; and oats six fold. Much flax is raised here, and about 2000l. worth sold out of the island in yarn, which might better be manufactured on the spot, to give employ to the poor natives. Notwithstanding the excellency of the land, above 1000l. worth of meal is annually imported (A). Ale is frequently made in this island of the young tops of heath, mixing two-thirds of that plant with one of malt, sometimes adding hops. Boethius relates, that this liquor was much used among the Picts; but when that nation was extirpated by the Scots, the secret of making it perished with them. Numbers of cattle are bred here, and about 1700 are annually exported at the

(A) This might have been the case in the time of Pennant, from whom the above account is taken. It is not so now, although the population has increased to nearly 12,000. Isla indeed enjoys the peculiar advantages of being not only a grazing but a corn country, and can thus afford a very considerable exportation of both species of produce. The number of cattle now exported far exceeds that stated above by Pennant.

the price of 50 shillings each. The island is often overstocked, and numbers die in March for want of fodder. None but milch-cows are housed: cattle of all other kinds, except the saddle-horses, run out during winter.

The number of inhabitants, when Ilay was visited by Pennant, is computed to have been between seven and eight thousand. About 700, says he, are employed in the mines and in the fishery: the rest are gentlemen-farmers, and subtenants or servants. The women spin. The servants are paid in kind; the sixth part of the crop. They have houses gratis; the master gives them the feed for the first year, and lends them horses to plough annually the land annexed.

The quadrupeds of this island, as enumerated by Mr Pennant*, are stots, weefels, otters, and hares: the last small, dark-coloured, and bad runners. The birds are eagles, peregrine falcons, black and red game, and a very few ptarmigans. Red-breasted goofanders breed on the shore among the loose stones, wild geese in the moors, and herons in the island in Loch-guirm. The fish are plaise, sneardab, large dabs, mullets, ballan, lump-fish, black goby, greater dragonet, and that rare fish the lepadogaster of M. Gouan. Vipers swarm in the heath: the natives retain the vulgar error of their stinging with their forked tongues (B); that a sword on which the poison has fallen will hiss in water like a red-hot iron; and that a poultice of human ordure is an infallible cure for the bite.

In this island, Mr Pennant informs us, several ancient diversions and superstitions are still preserved: the last indeed are almost extinct, or at most lurk only amongst the very meanest of the people. The late-wakes or funerals, like those of the Romans, were attended with sports, and dramatic entertainments composed of many parts, and the actors often changed their dresses suitably to their characters. The subject of the drama was historical, and preserved by memory.—The power of fascination is as strongly believed here as it was by the shepherds of Italy in times of old.

Nescio quis teneros oculis mihi fascinat agnos?

But here the power of the evil eye affects more the milch-cows than lambs. If the good housewife perceives the effect of the malicious on any of her kine, she takes as much milk as she can drain from the enchanted herd (for the witch commonly leaves very little). She then boils it with certain herbs, and adds to them flints and untempered steel; after that she secures the door, and invokes the three sacred persons. This puts the witch into such an agony, that she comes nilling-willing to the house, begs to be admitted, to obtain relief by touching the powerful pot: the good woman then makes her terms; the witch restores the milk to the cattle, and in return is freed from her pains. But sometimes, to save the trouble of those charms (for it may happen that the disorder may arise from other causes than an evil-eye), the trial is made by immersing in milk a certain herb, and if the cows are supernaturally affected, it instantly distils blood. The unsuccessful lover revenges himself on his happy

rival by charms potent as those of the shepherd Alpheisbæus, and exactly similar:

*Necte tribus nodis ternos, Amarylli, colores:
Necte, Amarylli, modo.*

Donald takes three threads of different hues, and ties three knots on each, three times imprecating the most cruel disappointments on the nuptial bed: but the bridegroom, to avert the harm, stands at the altar with an untied shoe, and puts a sixpence beneath his foot.

History furnishes very few materials for the great events or revolutions of Ilay. It seems to have been long a seat of empire, probably jointly with the isle of Man, as being most conveniently situated for the government of the rest of the Hebrides; for Crovan the Norwegian, after his conquest of that island in 1066, retired and finished his days in Ilay. There are more Danish or Norwegian names of places in this island than any other: almost all the present farms derive their titles from them; such as Persibus, Torridale, Torribolse, and the like. On the retreat of the Danes it became the seat of their successors the lords of the isles; and continued, after their power was broken, in the reign of James III. in their descendants the Macdonalds, who held or ought to have held it from the crown. It was in the possession of a Sir James Macdonald, in the year 1598, the same who won the battle of Traii-dhruinard. His power gave umbrage to James VI. who directed the lord of Macleod, Cameron of Lochiel, and the Macneiles of Barra, to support the Macleans in another invasion. The rival parties met near the hill of Benbigger, east of Killarow; a fierce engagement ensued, and the Macdonalds were defeated and almost entirely cut off. Sir James escaped to Spain; but returned in 1620, was pardoned, received a pension, and died the same year at Glasgow; and in him expired the last of the great Macdonalds. But the king, irritated by the disturbances raised by private wars waged between these and other clans, resumed the grant made by his predecessor, and transferred it to Sir John Campbell of Calder, who held it on paying an annual feu-duty of five hundred pounds sterling, which is paid to this day. The island was granted to Sir John as a reward for his undertaking the conquest; but the family considered it as a dear acquisition, by the loss of many gallant followers, and by the expences incurred in support of it.

ILCHESTER, a town of Somersetshire in England, seated on the river Yeovil, 129 miles from London, is so called, because it once had a castle, and stands on the river Ivel. It is a place of great antiquity, as appears by the Roman coins which are sometimes dug up. It is likewise evident, from the ruins and from two towers on the bridge, that it was once a large place, and encompassed with a double wall. It also had several parish-churches, though now but one. It is governed by two bailiffs, who with the twelve burgesses are lords of the manor. In the reign of Edward III. the assizes for the county were fixed here, which have since been held

(B) This vulgar error is by no means limited to the natives of Ilay.

Na. the price of 50 shillings each. The island is often overstocked, and numbers die in March for want of fodder. None but milch-cows are housed: cattle of all other kinds, except the saddle-horses, run out during winter.

Voyage to the Hebrides, ii. 263.

Na, Ilchester.

held alternately at Wells, Taunton, and Bridgewater. The knights of the shire are always chosen here, and it is the place for the county courts and jail. On the latter is its chief dependence, and therefore it cannot be very polite. It is noted for being the birth-place of Roger the famous Friar Bacon. Ilchester is an earldom in the Fox family.

ILDEFONSO, Sr, a celebrated royal residence of Spain, distant about two miles from Segovia. It was erected by Philip V. in the midst of a solitary wood, and in the bosom of sleep mountains. It is chiefly remarkable for its gardens. There is nothing magnificent in the palace, particularly in its exterior appearance. The front on the side of the garden is of the Corinthian order, and not destitute of elegance. Here are the king's apartments, which look upon a parterre surrounded with vases and marble statues, and a cascade which, for the richness of its decorations, may be compared with the finest of the kind.

The purity and clearness of the water is indeed incomparable. Philip V. could not, in this respect, be better served by nature. From the mountains which shade the palace descend several rivulets, which supply the reservoirs. These waters answer the double purpose of supplying numerous fountains, and of diffusing life and verdure through the magnificent gardens, the sight of which alone is a sufficient recompense for a journey into Spain. They are on the inside a league in circumference. The inequality of the ground affords every moment new points of view. The principal alleys answer to different summits of neighbouring mountains; and one in particular produces the most agreeable effect. It is terminated at one end by the grand front of the palace. From this point are seen, at one view, five fountains, ornamented with elegant groups, rising into an amphitheatre, above which appear the summits of lofty mountains. The most elevated of these groups is that of Andromeda fastened to a rock. When seen at a little distance it is perhaps defective, because the rock appears too diminutive by the side of the monster which threatens Andromeda; and of Perseus, by whom it is attacked; but the whole contributes to the beauty of the view. The most remarkable of the five groups is that of Neptune.

"Genius (says M. Bourgoanne †) presided at the composition and in the choice of the situation; the deity of the ocean appears erect, surrounded by the marine court. His attitude, his threatening countenance, and the manner of holding his trident, announce that he has just imposed silence on the mutinous waves; and the calm which reigns in the basin, defended from every wind by the triple wall of verdure by which it is surrounded, seems to indicate that he has not issued his commands in vain. Often have I seated myself, with Virgil in my hand, by the side of this silent water, under the shade of the verdant foliage, nor ever did I fail to recollect the famous *Quos Ego!*"

"There are other fountains worthy of the attention of the curious; such as that of Latona, where the limpid sheaves, some perpendicularly, and others in every direction, fall from the hoarse throats of the Lycian peasants, half transformed into frogs, and spouting them forth in such abundance, that the statue of the goddess disappears under the wide mantle of liquid crystal; that also of Diana in the bath, sur-

rounded by her nymphs; in the twinkling of an eye all the chaste court is hidden beneath the waters; the spectator imagines he hears the whistling of aquatic birds, and the roaring of lions, from the place whence this momentary deluge escapes by a hundred canals. The fountain of Fame is formed by a single jet-d'eau, which rises 130 feet, exhibiting to the distance of several leagues round the triumph of art over nature, and falls in a gentle shower upon the gazing spectators. There are some situations in the gardens of St Ildefonso, whence the eye takes in the whole or the greater part of these fountains, and where the ear is delighted with the harmony of their murmurs. The traveller who wishes to charm all his senses at once, must take his station on the high flat ground in front of the king's apartment. In the thick part of the foliage are contrived two large arbours, from the top of which are seen twenty crystal columns rising into the air to the height of the surrounding trees, mixing their resplendent whiteness with the verdure of the foliage, uniting their confused noise to the rustling of the branches, and refreshing and embalming the air: if the traveller here experience no pleasing sensations, let him return home; he is utterly incapable of feeling either the beauties of art or nature.

"The reader may here imagine (continues our author) my enthusiasm too extravagant. He is mistaken; let him follow me to the great reservoir of abundant and limpid waters. He will have to climb for some minutes, but will not regret the trouble he has taken. Let us suppose ourselves arrived at the long and narrow alley which takes up the whole of the upper part of the gardens; proceed to the middle, and turn your face towards the castle. To the vast horizon around you, no other boundaries are discovered but those which limit the human sight; these alone prevent you from discovering the Pyrenees. Observe the steeple, which seems but a point in the immense extent: you will perhaps imagine it to be that of the parish-church of St Ildefonso; but, in reality, it is the cathedral of Segovia, at two leagues distance. The gardens, through which you have passed, become narrower to the eye. You suppose yourself close to the royal habitation; the alleys, fountains, and parterres, have all disappeared; you see but one road, which, in the form of a vessel, upon the prow of which you seem to stand, has its stern on the top of the palace. Afterward turn and take a view of the little lake behind you, of which the irregular borders do not, like what we call our English gardens, merely ape the disorder of nature. Nature herself has traced them, except on the side where you stand. This straight alley is united at each end to the curve which surrounds the reservoir. The waters, which stream in abundance from the sides of the mountain in front, meet in this reservoir, and thence descend by a thousand invisible tubes to other reservoirs, whence they are spouted in columns or sheets upon the flowery soil to which they were strangers. The birds, drawn by their clearness, come to skim and agitate their crystal. The image of the tufted woods which surround them is reflected from their immovable surface, as is also that of some simple and rural houses, thrown, as by accident, into this delightful picture, which Lorrain would have imitated, but perhaps could not have imagined. The opposite bank is obscured

Ildefonso, secured by thick shades. Some hollows, overshadowed by arching trees, seem to be the asylums of the Naiades. Disturb them not by indiscreet loquacity, but silently admire and meditate.

"It is impossible, however, not to go to the source of these waters; let us follow the meandering of their course, and observe the winding paths which terminate, after appearing and disappearing at intervals through the copse. Let us listen to the bubbling of the rivulets which from time to time escape from our sight, and hasten to the rendezvous assigned them by the descendants of Louis XIV. They formerly lost themselves in the valleys, where they quenched the thirst of their humble inhabitants, but are now consecrated to the pleasures of kings. Ascending the back of the pyramidal mountain, behind which their source is concealed, we arrive at the wall which confines a part of them in the garden, and which was hidden by the trees; nothing, however, ought here to recal to mind exclusive property and slavery. Woods, waters, and the majestic solitude of mountains, which are at a distance from the tumult of courts and cities, are the property of ever man.—Beyond this wall, which forms the exterior enclosure of the gardens, is an empty and flat ground, where the infant Don Louis, brother to the king, chose a place which he consecrated to cultivation. Farther on, the mountain becomes more steep, and is covered with trees to its summit. Let us now return; as we seek amusement and not fatigue. We will follow the course of the waters, they descend in bubbling streams from one level of the gardens to the other. In their course, in one place they water the feet of the trees, in others they cross an alley to nourish more slowly the plants of a parterre. From the basin of Andromeda they run between two rows of trees in the form of a canal, the too sudden inclination of which is taken off by cascades and windings. They receive and carry with them from the gardens the rivulets; which after having played amongst the gods and nymphs, and moistened the throats of the swans, tritons, and lions, humbly descend under ground, and run on into the bosom of the neighbouring meadows, where they fulfil purposes less brilliant but more useful.

"We must not quit these magnificent gardens without stopping at a place which appears to promise much, but produces not any very great effect. This is the square of the eight alleys, *Plaza de las ocho calles*. In the centre is the group of Pandora, the only one which is of whitened stone, all the others are of white marble or lead painted of a bronze colour. Eight alleys answer to this centre, and each is terminated by a fountain. Plats of verdure fill up the intervals between the alleys, and each has an altar under a portico of white marble by the side of a basin sacred to some god or goddess. These eight altars, placed at equal distances, and decorated among other jets-d'eau, have two which rise in the form of tapers on each side of their divinities. This cold regularity displeased Philip V. who a little before his death, when visiting the gardens, made some severe reproaches to the inventor upon the subject. Philip had not the pleasure of completely enjoying what he had created; death surprised him when the works he had begun were but half finished. The undertaking was however the most expensive one of his

reign. The finances of Spain, so deranged under the princes of the house of Austria, (thanks to the wise calculations of Orry, to the subsidies of France, and still more to the courageous efforts of the faithful Castilians) would have been sufficient for three long and ruinous wars, and for all the operations of a monarchy which Philip V. had conquered and formed anew, as well as to have resisted the shocks of ambition and political intrigue; but they sunk beneath the expensive efforts of magnificence."

It is singular that the castle and gardens of St Ildefonso should have cost about 45,000,000 of piastres, precisely the sum in which Philip died indebted. This enormous expence will appear credible, when it is known that the situation of the royal palace was at the beginning of this century the sloping top of a pile of rocks: that it was necessary to dig and hew out the stones, and in several places to level the rock; to cut out of its sides a passage for a hundred different canals, to carry vegetative earth to every place in which it was intended to substitute cultivation for sterility, and to work a mine to clear a passage to the roots of the numerous trees which are there planted. All these efforts were crowned with success. In the orchards, kitchen-gardens, and parterres, there are but few flowers, espaliers, or plants, which do not thrive; but the trees, naturally of a lofty growth, and which consequently must strike their roots deep into the earth, already prove the insufficiency of art when it attempts to struggle against nature. Many of them languish with withered trunks, and with difficulty keep life in their almost naked branches. Every year it is necessary to call in the aid of gunpowder to make new beds for those which are to supply their place; and none of them are covered with that tufted foliage which belongs only to those that grow in a natural soil. In a word, there are in the groves of St Ildefonso, marble statues, basins, cascades, limpid waters, verdure, and delightful prospects, every thing but that which would be more charming than all the rest, thick shades.

The court of Spain comes hither annually during the heat of the dog-days. It arrives towards the end of July, and returns at the beginning of October. The situation of St Ildefonso, upon the declivity of the mountains which separate the two Castiles, and fronting a vast plain where there is no obstacle to the passage of the north wind, renders this abode delightful in summer. The mornings and evenings of the hottest days are agreeably cool. Yet as this palace is upwards of 20 leagues from Madrid, and half of the road which leads to it crosses the broad tops of mountains, extremely steep in many places, it is much more agreeable to the lovers of the chase and solitude than to others.

ILERDA, in *Ancient Geography*, the capital of the Iligertes; situated on an eminence between the rivers Sicoris and Cinga: An unhappy city, often besieged, and often taken, because lying exposed to the incursions from Gaul; and under Gallienus it was destroyed by the Germans. Now *Lerida*, in Catalonia, on the river Segra.

ILEX, the HOLM or *Holly Tree*; a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 43d order, *Dumosa*. See *BOTANY Index*.

Ilfracomb
Ilkuch.

ILFRACOMB, a town of Devonshire, seated on the Severn sea, almost opposite to Swansea in Glamorganshire, 186 miles from London. It is a populous, rich, trading sea-port, especially with herrings in the Bristol-channel; noted for maintaining constant lights to direct the sailors; for its convenience of building and repairing ships; and for the safe shelter ships from Ireland find here, when it is extremely dangerous for them to run into the mouth of the Taw, which they call Barnstaple-water; and this is one reason why the Barnstaple merchants do so much of their business at this port. The harbour, with its quay, warp-house, lighthouse, pilot-boats, and tow-boats, were formerly maintained at the expence of the ancestors of the lord of the manor; and then it had a quay or pier 850 feet long; but by time and the violence of the sea all went to decay; to remedy which, the parliament passed an act in 1731, for both repairing and enlarging the piers, harbour, &c. It is governed by a mayor, bailiffs, &c. and consists chiefly of one street of scattered houses almost a mile long. The parish is large, containing several tythings and manors.

ILIAC PASSION, a violent and dangerous kind of colic; called also *volvulus*, *miserere mei*, and *chordapsus*. It takes its name from the intestine *ilion*, on account of its being usually affected in this distemper; or perhaps from the Greek verb *ιλαειν*, "to wind or twist;" whence also it is the Latins call it *volvulus*. See **MEDICINE Index**.

ILIAD, the name of an ancient epic poem, the first and finest of those composed by Homer.

The poet's design in the Iliad was to show the Greeks, who were divided into several little states, how much it was their interest to preserve a harmony and good understanding among themselves; for which end he sets before them the calamities that befel their ancestors from the wrath of Achilles, and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The Iliad is divided into 24 books or rhapsodies, which are marked with the letters of the alphabet.

ILISSUS, a river running to the east of Athens; which, with the Eridanus running on the west side, falls below the city into the sea. Sacred to the muses, called *Iliassides*; on whose bank their altar stood, and where the lustration in the less mysteries was usually performed.

ILIUM, **ILION**, or *Ilios*, in *Ancient Geography*, a name for the city of Troy, but most commonly used by the poets, and distinguished by the epithet *Vetus*; at a greater distance from the sea than what was afterwards called *Ilium Novum*, and thought to be the *Ilienium Pagus* of Strabo. New or modern Ilium was a village nearer the sea, with a temple of Minerva; where Alexander, after the battle of Granicus, offered gifts, and called it a city, which he ordered to be enlarged. His orders were executed by Lyfimachus, who encompassed it with a wall of 40 stadia. It was afterwards adorned by the Romans, who granted it immunities as to their mother-city. From this city the *Ilias* of Homer takes its name, containing an account of the war carried on between the Greeks and Trojans on account of the rape of Helen; a variety of disasters being the consequence, gave rise to the proverb *Ilias Malorum*.

ILKUCH, a town of Poland, in the palatinate of

Cracow, remarkable for its mines of silver and lead. It is seated in a barren and mountainous country, in E. Long. 20. 0. N. Lat. 50. 26.

ILLECEBRUM, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 12th order, *Holoraceae*. See **BOTANY Index**.

ILLENOIS, a people of North America, inhabiting a country lying near a large lake of the same name (called also *Michigan*), formed by the river St Lawrence. The country is fertile: and the people plant Indian corn, on which they chiefly subsist. They are civil, active, lively, and robust; and are much less cruel in their dispositions than the other Indian nations. They are, however, said to be great libertines, and to marry a number of wives; but some of their villages have embraced Christianity.

ILLICIUM, a genus of plants belonging to the decandria class; and in the natural method ranking with those of which the order is doubtful. See **BOTANY Index**.

ILLUMINATI, the name of a secret society, or order, in Germany and other countries of Europe, whose professed object, it is said, was to propagate the purest principles of virtue; but whose real views were to subvert every established government and religion, and delivering mankind from the necessary and salutary restraints of civil society, to bring them to an imaginary state of freedom and independence. Of this order much has been said, and much has been written; but that a society has existed, regularly organized in the way this has been represented, working in secret, and, at the same time, possessing such extensive power and influence, no proof whatever has been adduced. The thing indeed seems impossible. See **MASONRY, Free**.

ILLUMINATING, a kind of miniature painting, anciently much practised for illustrating and adorning books. Besides the writers of books, there were artists whose profession was to ornament and paint manuscripts, who were called *illuminators*; the writers of books first finished their part, and the illuminators embellished them with ornamented letters and paintings. We frequently find blanks left in manuscripts for the illuminators, which were never filled up. Some of the ancient manuscripts are gilt and burnished in a style superior to later times. Their colours were excellent, and their skill in preparing them must have been very great.

The practice of introducing ornaments, drawings, emblematical figures, and even portraits, into manuscripts, is of great antiquity. Varro wrote the lives of 700 illustrious Romans, which he enriched with their portraits, as Pliny attests in his *Natural History* (lib. xxxv. chap. 2.). Pomponius Atticus, the friend of Cicero, was the author of a work on the actions of the great men amongst the Romans, which he ornamented with their portraits, as appears in his life by Cornelius Nepos (chap. 18.). But these works have not been transmitted to posterity. There are, however, many precious documents remaining, which exhibit the advancement and decline of the arts in different ages and countries. These inestimable paintings and illuminations display the manners, customs, habits ecclesiastical, civil, and military, weapons and instruments of war, utensils and architecture of the ancients; they are of the greatest use in illustrating many important facts relative

Illuminat- ing. relative to the history of the times in which they were executed. In these treasures of antiquity, are preserved a great number of specimens of Grecian and Roman art, which were executed before the arts and sciences fell into neglect and contempt. The manuscripts containing these specimens form a valuable part of the riches preserved in the principal libraries of Europe. The Royal, Cottonian, and Harleian libraries, as also those in the two universities in England, the Vatican at Rome, the imperial at Vienna, the royal at Paris, St Mark's at Venice, and many others.

A very ancient MS. of Genesis, which was in the Cottonian library, and almost destroyed by a fire in 1731, contained 250 curious paintings in water colours. Twenty-one fragments, which escaped the fire, are engraved by the society of antiquarians of London. Several specimens of curious paintings also appear in Lambecius's catalogue of the imperial library at Vienna, particularly in vol. iii. where 48 drawings of nearly equal antiquity with those in the Cottonian library are engraved; and several others may be found in various catalogues of the Italian libraries. The drawings in the Vatican Virgil made in the fourth century, before the arts were entirely neglected, illustrate the different subjects treated of by the Roman poet. A miniature drawing is prefixed to each of the gospels brought over to England by St Augustin in the 6th century, which is preserved in the library of Corpus Christi college, Cambridge: in the compartments of these drawings are depicted representations of several transactions in each gospel. The curious drawings, and elaborate ornaments in St Cuthbert's gospels made by St Ethelwald, and now in the Cottonian library, exhibit a striking specimen of the state of the arts in England in the 7th century. The same may be observed with respect to the drawings in the ancient copy of the four gospels preserved in the cathedral church of Litchfield, and those in the Codex Rulworthianus in the Bodleian library at Oxford. The life of St Paul the hermit, now remaining in Corpus Christi college, Cambridge, (G. 2.), affords an example of the style of drawing and ornamenting letters in England in the 8th century; and the copy of Prudentius's *Psycomachia* in the Cottonian library (Cleop. c. 8.) exhibits the style of drawing in Italy in the 9th century. Of the 10th century there are Roman drawings of a singular kind in the Harleian library (N^o 2820.) N^{os} 5280, 1802, and 432, in the same library, contain specimens of ornamented letters, which are to be found in Irish MSS. from the 12th to the 14th century. Cædmon's Poetical Paraphrase of the book of Genesis, written in the 11th century, which is preserved amongst F. Junius's MSS. in the Bodleian library, exhibits many specimens of utensils, weapons, instruments of music, and implements of husbandry used by the Anglo-Saxons. The like may be seen in extracts from the Pentateuch of the same age in the Cottonian library (Claud. B. 4.). The manuscript copy of Terence in the Bodleian library (D. 17.) displays the dresses, masks, &c. worn by comedians in the 12th century, if not earlier. The very elegant Psalter in the library of Trinity college, Cambridge, exhibits specimens of the art of drawing in England in the same century. The Virgil in the Lambeth library of the 13th century (N^o 471.), written in Italy, shows both by the drawings and writing, that the Italians produced

works much inferior to ours at that period. The copy of the Apocalypse in the same library (N^o 209.), contains a curious example of the manner of painting in the 14th century.—The beautiful paintings in the history of the latter part of the reign of King Richard II. in the Harleian library (N^o 1319.), afford curious specimens of manners and customs, both civil and military, at the close of the 14th and in the beginning of the 15th century; as does N^o 2278. in the same library.—Many other instances might be produced; but those who desire farther information may consult Strutt's *Regal and Ecclesiastical Antiquities*, 4to, and his *Horde-Angelynnan* lately published in 3 vols.

This art was much practised by the clergy, and even by some in the highest stations in the church. "The famous Osmund (says Bromton), who was consecrated bishop of Salisbury, A. D. 1076, did not disdain to spend some part of his time in writing, binding, and *illuminating* books." Mr Strutt, as already noticed, has given the public an opportunity of forming some judgment of the degree of delicacy and art with which these illuminations were executed, by publishing prints of a prodigious number of them, in his "*Regal and Ecclesiastical Antiquities of England*," and "*View of the Customs, &c. of England*." In the first of these works we are presented with the genuine portraits, in miniature, of all the kings, and several of the queens of England, from Edward the Confessor to Henry VII. mostly in their crowns and royal robes, together with the portraits of many other eminent persons of both sexes.

The illuminators and painters of this period seem to have been in possession of a considerable number of colouring materials, and to have known the arts of preparing and mixing them, so as to form a great variety of colours: for in the specimens of their miniature-paintings that are still extant, we perceive not only the five primary colours, but also various combinations of them. Though Strutt's prints do not exhibit the bright and vivid colours of the originals, they give us equally a view, not only of the persons and dresses of our ancestors, but also of their customs, manners, arts, and employments, their arms, ships, houses, furniture, &c. and enable us to judge of their skill in drawing. The figures in these paintings are often stiff and formal; but the ornaments are in general fine and delicate, and the colours clear and bright, particularly the gold and azure. In some of these illuminations the passions are strongly painted. How strongly, for example, is terror painted in the faces of the earl of Warwick's sailors, when they were threatened with a shipwreck, and grief in the countenances of those who were present at the death of that hero *? After the introduction of print-
ing, this elegant art of illuminating gradually declined, and at length was quite neglected.

Before concluding, it may not be improper to observe, that from the 5th to the 10th century, the miniature paintings which we meet with in Greek manuscripts are generally good, as are some which we find among those of Italy, England, and France. From the 10th to the middle of the 14th century they are commonly very bad, and may be considered as so many monuments of the barbarity of those ages; towards the latter end of the 14th, the paintings in manuscripts were much improved; and in the two succeeding centuries,

* See Strutt, vol. ii. plates 56,

Illuminators
Illyrius.
turies, many excellent performances were produced, especially after the happy period of the restoration of the arts, when great attention was paid to the works of the ancients, and the study of antiquity became fashionable.

ILLUMINATORS. See ILLUMINATING.

ILLUMINED, ILLUMINATI, a church term, anciently applied to such persons as had received baptism. This name was occasioned by a ceremony in the baptism of adults; which consisted in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINED, *Illuminati*, is also the name of a sect of heretics, who sprang up in Spain about the year 1575, and were called by the Spaniards *Alambrados*. Their principal doctrines were, that by means of a sublime manner of prayer, which they had attained to, they entered into so perfect a state, that they had no occasion for ordinances, sacraments, nor good works; and that they could give way, even to the vilest actions, without sin. The sect of Illumined was revived in France in the year 1634, and were soon after joined by the Guerinets, or disciples of Peter Guerin, who together made but one body, called also *Illumined*; but they were so hotly pursued by Louis XIII. that they were soon destroyed. The brothers of the Rosy Cross are sometimes also called *Illumined*. See ROSYCRUSIAN.

ILLUSTRIOUS, ILLUSTRIS, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain rank. It was first given to the most distinguished among the knights, who had a right to bear the *latus clavus*: afterwards, those were intitled *illustrious* who held the first rank among those called *honorati*; that is, the *præfecti prætorii*, *præfecti urbis*, treasurers, *comites*, &c.

There were, however, different degrees among the *illustrious*: as in Spain they have *grandees* of the first and second class, so in Rome they had their *illustres*, whom they called great, *majores*; and others less, called *illustres minores*.—For instance; the *præfectus prætorii* was a degree below the master of the offices, though they were both *illustres*.

The Novels of Valentinian distinguish as far as five kinds of *illustres*; among whom, the *illustres administratores* bear the first rank.

ILLYRICUM, (*Solum* perhaps understood) Livy, Herodian, St Paul; called *Illyris* by the Greeks, and sometimes *Illyria*; the country extending from the Adriatic to Pannonia thus called. Its boundaries are variously assigned. Pliny makes it extend in length from the river Arsia to the Drinius, thus including Liburnia to the west, and Dalmatia to the east: which is also the opinion of Ptolemy; who settles its limits from Mount Scardus and the Upper Moesia on the east, to Istria in the west. A Roman province, divided by Augustus into the Superior and Inferior, but of which the limits are left undetermined both by ancient historians and geographers. *Illyrii* the people; called *Illyres* by the Greeks. The country is now called *Slavonia*.

ILLYRIUS, MATTHIAS, FLACCUS, or FRANOWITZ, one of the most learned divines of the Augsburg confession, born in Istria, anciently called *Illyrica*, in 1520. He is said to have been a man of vast genius, extensive

learning, of great zeal against Popery; but of such a restless and passionate temper, as overbalanced all his good qualities, and occasioned much disturbance in the Protestant church. He published a great number of books, and died in 1575.

IMAGE, in a religious sense, is an artificial representation or similitude of some person or thing, used either by way of decoration and ornament, or as an object of religious worship and adoration: in which last sense it is used indifferently with the word **IDOL**.

The noble Romans preserved the *images* of their ancestors with a great deal of care and concern, and had them carried in procession at their funerals and triumphs: these were commonly made of wax, or wood, though sometimes of marble or brass. They placed them in the vestibules of their houses; and they were to stay there, even if the houses happened to be sold, it being accounted impious to displace them. Appius Claudius was the first who brought them into the temples, in the year of Rome 259, and he added inscriptions to them, showing the origin of the persons represented, and their brave and virtuous achievements.—It was not, however, allowed for all, who had the *images* of their ancestors in their houses, to have them carried at their funerals; this was a thing only granted to such as had honourably discharged themselves of their offices; for those who failed in this respect forfeited that privilege; and in case they had been guilty of any great crime, their *images* were broken in pieces. See **IGNOBILES** and **JUS**.

The Jews absolutely condemn all *images*, and do not so much as suffer any statues or figures in their houses, much less in their synagogues or places of worship.

The use and adoration of *images* are things that have been a long time controverted in the world.

It is plain, from the practice of the primitive church, recorded by the earlier fathers, that Christians, for the first three centuries after Christ, and the greater part of the fourth, neither worshipped *images* nor used them in their worship. However, the greater part of the Popish divines maintain, that the use and worship of *images* were as ancient as the Christian religion itself: to prove this, they allege a decree, said to have been made in a council held by the Apostles at Antioch, commanding the faithful, that they may not err about the object of their worship, to make *images* of Christ and worship them. Baron. ad ann. 102. But no notice is taken of this decree, till 700 years after the Apostolic times, after the dispute about *images* had commenced. The first instance that occurs in any credible author of *images* among Christians, is that recorded by Tertullian de Pudicit. c. 10. of certain cups, or chalices, as Bellarmine pretends, on which was represented the parable of the good shepherd carrying the lost sheep on his shoulders: but this instance only proves, that the church, at that time did not think emblematical figures unlawful ornaments of cups or chalices. Another instance is taken from Eusebius, Hist. Eccl. lib. vii. cap. 18. who says, that in his time there were to be seen two brass statues in the city of Paneas or Cafarea Philippi; the one of a woman on her knees, with her arms stretched out, the other of a man over against her, with his hand extended to receive her: these statues were said to be the *images* of our Saviour
and!

Image.

and the woman whom he cured of an issue of blood. From the foot of the statue representing our Saviour, says the historian, sprung up an exotic plant, which, as soon as it grew to touch the border of his garment, was said to cure all sorts of distempers. Eusebius, however, vouches none of these things: nay, he supposes that the woman who erected this statue of our Saviour was a pagan, and ascribes it to a pagan custom. Farther, Philostorgius, Eccl. Hist. lib. vii. c. 3. expressly says, that this statue was carefully preserved by the Christians, but that they paid no kind of worship to it, because it is not lawful for Christians to worship brass, or any other matter. The primitive Christians abstained from the worship of *images*, not, as the Papists pretend, from tenderness to heathen idolaters, but because they thought it unlawful in itself to make any *images* of the Deity. Justin Mart. Apol. ii. p. 44. Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 46. Aug. de Civit. Dei. lib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symb. c. 7. Lactant. lib. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. p. 202. Some of the fathers, as Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, by the second commandment, the arts of painting and engraving were rendered unlawful to a Christian, styling them evil and wicked arts. Tert. de Idol. cap. 3. Clem. Alex. Admon. ad. Gent. p. 41. Orig. contra Celsum. lib. vi. p. 182. The use of *images* in churches as ornaments, was first introduced by some Christians in Spain, in the beginning of the fourth century; but the practice was condemned as a dangerous innovation, in a council held at Eliberis in 305. Epiphanius, in a letter preserved by Jerome, tom. ii. ep. 6. bears strong testimony against *images*, and may be considered as one of the first ICONOCLASTS. The custom of admitting pictures of saints and martyrs into the churches (for this was the first source of *image-worship*) was rare in the latter end of the fourth century; but became common in the fifth: however, they were still considered only as ornaments; and even in this view, they met with very considerable opposition. In the following century the custom of thus adorning churches became almost universal, both in the east and west. Petavius expressly says (de Incar. lib. xv. cap. 14.), that no statues were yet allowed in the churches; because they bore too near a resemblance to the idols of the Gentiles. Towards the close of the fourth or beginning of the fifth century, *images*, which were introduced by way of ornament, and then used as an aid to devotion, began to be actually worshipped. However, it continued to be the doctrine of the church in the sixth and in the beginning of the seventh century, that *images* were to be used only as helps to devotion, and not as objects of worship. The worship of them was condemned in the strongest terms by Pope Gregory the Great; as appears by two letters of his written in 601. From this time to the beginning of the eighth century, there occurs no single instance of any worship given or allowed to be given to *images* by any council or assembly of bishops whatever. But they were commonly worshipped by the monks and populace in the beginning of the eighth century; inasmuch, that in the year 726, when Leo published his famous edict, it had already spread into all the provinces subject to the empire.

The Lutherans condemn the Calvinists for breaking the *images* in the churches of the Catholics, look-

ing on it as a kind of sacrilege; and yet they condemn the Romanists (who are professed *image-worshippers*) as idolaters: nor can these last keep pace with the Greeks, who go far beyond them in this point; which has occasioned abundance of disputes among them. See ICONOCLASTS.

The Mahometans have a perfect aversion to *images*; which was what led them to destroy most of the beautiful monuments of antiquity, both sacred and profane, at Constantinople.

IMAGE, in *Rhetoric*, also signifies a lively description of any thing in discourse.

Images in discourse are defined by Longinus, to be, in general, any thoughts proper to produce expressions, and which present a kind of picture to the mind.

But, in the more limited sense, he says, *images* are such discourses as come from us, when, by a kind of enthusiasm, or an extraordinary emotion of the soul, we seem to see the things whereof we speak, and present them before the eyes of those who hear us.

Images, in rhetoric, have a very different use from what they have among the poets: the end principally proposed in poetry is, astonishment and surprize; whereas the thing chiefly aimed at in prose, is to paint things naturally, and to show them clearly. They have this, however, in common, that they both tend to move, each in its kind.

These *images*, or *pictures*, are of vast use, to give weight, magnificence, and strength, to a discourse. They warm and animate it; and when managed with art, according to Longinus, seem, as it were, to tame and subdue the hearer, and put him in the power of the speaker.

IMAGE, in *Optics*, a figure in the form of any object, made by the rays of light issuing from the several points of it, and meeting in so many other points, either at the bottom of the eye, or on any other ground, or on any transparent medium, where there is no surface to reflect them. Thus we are said to see all objects by means of their images formed in the eye.

IMAGINARY QUANTITIES, or *Impossible Quantities*, in *Algebra*, are the even roots of negative quantities; which expressions are imaginary, or impossible, or opposed to real quantities; as $\sqrt{-aa}$, or $\sqrt[4]{-a^4}$, &c. For as every even power of any quantity whatever, whether positive or negative, is necessarily positive, or having the sign +, because + by +, or - by -, give equally +; hence it follows that every even power, as the square for instance, which is negative, or having the sign -, has no possible root; and therefore the even roots of such powers or quantities are said to be impossible or imaginary. The mixt expressions arising from imaginary quantities joined to real ones, are also imaginary; as $a - \sqrt{-aa}$, or $b + \sqrt{-aa}$.

IMAGINARY Roots of an equation, are those roots or values of the unknown quantity, which contain some imaginary quantity. Thus, the roots of the equation $xx + aa = 0$, are the two imaginary quantities $+\sqrt{-aa}$ and $-\sqrt{-aa}$, or $+a\sqrt{-1}$ and $-a\sqrt{-1}$.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of sense. See METAPHYSICS.

Force of IMAGINATION. See MONSTER.

IMAGO, in *Natural History*, is a name given by Linnæus

Image

||

Imago.

Imeretia.

Linnaeus to the third state of insects, when they appear in their proper shape and colours, and undergo no further transformation.

IMAM, or **IMAN**, a minister in the Mahometan church, answering to a parish priest among us. The word properly signifies what we call a prelate, *antistes*, one who presides over others; but the Mussulmans frequently apply it to a person who has the care and intendency of a mosque, who is always there at first, and reads prayers to the people, which they repeat after him.

IMAM is also applied, by way of excellence, to the four chiefs or founders of the four principal sects in the Mahometan religion. Thus Ali is the *imam* of the Persian, for of the sect of the Schiaites; Abu-beker the *imam* of the Sunnites, which is the sect followed by the Turks; Saphii, or Safi-y, the *imam* of another sect, &c.

The Mahometans do not agree among themselves about this *imamate* or dignity of the *imam*. Some think it of divine right and attached to a single family, as the pontificate of Aaron.—Others hold, that it is indeed of divine right, but deny it to be so attached to any single family, as that it may not be transferred to another. They add, that the *imam* is to be clear of all gross sins; and that otherwise he may be deposed, and his dignity may be conferred on another. However this be, it is certain, that after an *imam* has once been owned as such by the Mussulmans, he who denies that his authority comes immediately from God is accounted impious; he who does not obey him is a rebel; and he who pretends to contradict what he says is esteemed a fool, among the orthodox of that religion. The *imams* have no outward mark of distinction; their habit is the same with that of the Turks in common, except that the turban is a little larger, and folded somewhat differently.

IMAUS, in *Ancient Geography*, the largest mountain of Asia (Strabo); and a part of Taurus (Pliny); from which the whole of India runs off into a vast plain, resembling Egypt. It extends far and wide through Scythia, as far as to the Mare Glaciale, dividing it into the Hither or *Scythia intra Imaum*, and into the Farther or *Scythia extra Imaum* (Ptolemy); and also stretching out along the north of India to the eastern ocean, separates it from Scythia. It had various names according to the different countries it run through: Postellus thinks it is the *Sephar* of Scripture.

IMBECILITY, a languid infirm state of body, which, being greatly impaired, is not able to perform its usual exercises and functions.

IMBIBING, the action of a dry porous body, that absorbs or takes up a moist or fluid one: thus, sugar imbibes water; a sponge, the moisture of the air, &c.

IMBRICATED, is used by some botanists, to express the figure of the leaves of some plants, which are hollowed like an *imbrex*, or gutter-tile, or are laid in close series over one another like the tiles of a house.

IMERETIA, or **IMERETTA**, the name of a kingdom, or rather principality, of Georgia, consisting of four provinces, is under the dominion of a prince named *David*. See **GEORGIA**.

The capital, where Prince David resides, is called *Curtays*. The remains of a church announce that *Curtays* was formerly a large city; but at present it can scarcely be accounted a village.

Solomon, the father of the present sovereign, ordered the city to be destroyed as well as the ramparts of the city; for he thought, and very wisely, that Caucasus was the only fortification capable of being defended by an army of 6000 men undisciplined and destitute of artillery.

The number of the inhabitants of Imeretta is reckoned to be 20,000 families; but the greater part of them live neither in towns nor villages, but are dispersed throughout the level country, each of them possessing a small hut or cottage. These people have fewer strangers among them, and they are more engaging in their appearance, than the Georgians. They are of a milder and less pusillanimous character; and the principal branch of their commerce consists in wines, a considerable quantity of which they export in skins as far as the confines of Georgia. They are acquainted with no other trade; for they are poor and miserable, and greatly oppressed by their lords.

The ordinary revenues of Imeretta, like those of Georgia, arise from a tythe which vassals are obliged to pay in wines, cattle, and corn, and some subsidies furnished annually by neighbouring princes. The extraordinary revenues for the most part arise from confiscations of every kind; but notwithstanding this, the finances of the prince are so limited, that he is often under the necessity of going from house to house, to live at the expence of his vassals, never quitting their habitations until the pressing wants of his hosts absolutely compel him. It is therefore probable, that the court of the sovereign of Imeretta is as deficient in brilliancy as his table is in splendour when he dines at home. His principal dishes consist of a certain food called *gom*, which is a kind of millet boiled, and a piece of roast meat, with some high-seasoned sauce. He never eats but with his fingers, for forks and spoons are unknown in Imeretta. At table he generally gives audiences respecting affairs of the first consequence, which he determines as he thinks proper; for in every country subject to his dominions there is no other law but his will.

On Friday, which is the market day, all his new edicts are published by a kind of herald, who climbs up into some tree, in order to proclaim the will of his sovereign. The Imerettans profess the religion of the Greek church. Their patriarch must be of the royal family; but it is seldom that he can either read or write; the priests who compose the rest of the clergy are not much more enlightened. The greater part of their churches are pitiful edifices, which can scarcely be distinguished from the common huts of the inhabitants but by a pasteboard crucifix, and a few coarse-paintings of the Virgin, which are seen in them.

IMITATION, derived from the Latin *imitare*, to "represent or repeat," a sound or action, either exactly or nearly in the same manner as they were originally exhibited.

IMITATION, in *Music*, admits of two different senses. Sound and motion are either capable of imitating themselves by a repetition of their own particular modes, or of imitating other objects of a nobler and more ab-

stracted

Imeretia, Imitation.

Imitation. stracted nature. Nothing perhaps is so purely mental, nothing so remote from external sense, as not to be imitable by music. But as the description of this in M. Rousseau, article *Imitation*, is nobly animated, and comprehends all that is necessary to be said on the subject, we translate it as follows.

“Dramatic or theatrical music (says he) contributes to imitation no less than painting or poetry: it is in this common principle that we must investigate both the origin and the final cause of all the fine arts; as M. le Batteaux has shown*. But this imitation is not equally extensive in all the imitative arts. Whatever the imagination can represent to itself is in the department of poetry. Painting, which does not present its pictures to the imagination immediately, but to external sense, and to one sense alone, paints only such objects as are discoverable by sight. Music might appear subjected to the same limits with respect to the ear; yet it is capable of painting every thing, even such images as are objects of ocular perception alone: by a magic almost inconceivable, it seems to transform the ears into eyes, and endow them with the double function of perceiving visible objects by the mediums of their own; and it is the greatest miracle of an art, which can only act by motion, that it can make that very motion represent absolute quiescence. Night, sleep, silence, solitude, are the noble efforts, the grand images, represented by a picturesque music. We know that noise can produce the same effect with silence, and silence the same effect with noise; as when one sleeps at a lecture insipidly and monotonically delivered, but wakes the instant when it ends. But music acts more intimately upon our spirits, in exciting by one sense dispositions similar to those which we find excited by another; and, as the relation between these images cannot be sensible unless the impression be strong, painting, when divested of this energy, cannot restore to music that assistance in imitations which she borrows from it. Though all nature should be asleep, he who contemplates her does not sleep; and the art of the musician consists in substituting, for this image of insensibility in the object, those emotions which its presence excites in the heart of the contemplator. He not only ferments and agitates the ocean, animates the flame to conflagration, makes the fountain murmur in his harmony, calls the rattling shower from heaven, and swells the torrent to resistless rage; but he paints the horrors of a boundless and frightful desert, involves the subterraneous dungeon in tenfold gloom, soothes the tempest, tranquillizes the disturbed elements, and from the orchestra diffuses a recent fragrance through imaginary groves; nay, he excites in the soul the same emotions which we feel from the immediate perception and full influence of these objects.”

Under the word *Harmony*, Rousseau has said, that no assistance can be drawn from thence, no original principle which leads to musical imitation; since there cannot be any relation between chords and the objects which the composer would paint, or the passions which he would express. In the article *Melody*, he imagines he has discovered that principle of imitation which harmony cannot yield, and what resources of nature are employed by music in representing these objects and these passions.

It is hoped, however, that in our article of *MELODY*, *Imitation* we have shown upon what principle musical imitation may be compatible with harmony; though we admit, that from melody it derives its most powerful energy, and its most attractive graces. Yet we must either be deceived beyond all possibility of cure, or we have felt the power of imitative harmony in a high degree. We are certain that the fury, the impetuosity, the rapid vicissitudes, of a battle, may be successfully and vividly represented in harmony. We have participated the exultation and triumph of a conquest, inspired by the sound of a full chorus. We have felt all the solemnity and grandeur of devotion from the slow movement, the deep chords, the swelling harmony, of a sentimental composition played upon the organ. Nor do we imagine harmony less capable of presenting the tender depression, the fluctuating and tremulous agitation, of grief. As this kind of imitation is the noblest effort of music, it is astonishing that it should have been overlooked by M. d'Alembert. He has indeed apologized, by informing us, that his treatise is merely elementary: but we are uncertain how far this apology ought to be regarded as sufficient, when it is at the same time considered, that he has given an account of imitation in its mechanical, or what Rousseau calls its *technical*, sense; which, however, to prevent ambiguity, we should rather choose to call *mimesis*, or *ancephaliosis*. To Rousseau's account of the word in this acceptance, we return.

“Imitation (says he), in its technical sense, is a reiteration of the same air, or of one which is similar, in several parts where it is repeated by one after the other, either in unison, or at the distance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough pursued even though several notes should be changed; provided the same air may always be recognized, and that the composer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more sensible, it is preceded by a general rest, or by long notes which seem to obliterate the impression formerly made by the air till it is renewed with greater force and vivacity by the commencement of the imitation. The imitation may be treated as the composer chooses; it may be abandoned, resumed, or another begun, at pleasure; in a word, its rules are as much relaxed as those of the fugue are severe; for this reason, it is despised by the most eminent masters; and every imitation of this kind too much affected, almost always betrays a novice in composition.”

IMITATION, in *Oratory*, is an endeavour to resemble a speaker or writer in those qualities with regard to which we propose them to ourselves as patterns. The first historians among the Romans, says Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how closely Virgil has imitated Homer in his *Æneid*, Hesiod in his *Georgics*, and Theocritus in his *Eclogues*. Terence copied after Menander; and Plautus after Epicarmus, as we learn from Horace, lib. ii. ep. ad August. who himself owes many of his beauties to the Greek lyric poets. Cicero appears, from many passages in his writings, to have imitated the Greek orators. Thus Quintilian says of him, that he has expressed the strength and sublimity of Demosthenes,

Immacu-
late
||
Impale.

mosthenes, the copiousness of Plato, and the delicacy of Isocrates.

IMMACULATE, something without stain, chiefly applied to the conception of the holy Virgin. See *CONCEPTION, Immaculate*.

IMMATERIAL, something devoid of matter, or that is pure spirit. See *METAPHYSICS*.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we say, an immediate cause, in opposition to a mediate or remote one.

IMMEMORIAL, an epithet given to the time or duration of any thing whose beginning we know nothing of.

In a legal sense, a thing is said to be *of time immemorial*, or *time out of mind*, that was before the reign of our king Edward II.

IMMENSITY, an unlimited extension, or which no finite and determinate space, repeated ever so often, can equal.

IMMER, the most easterly island of all the New Hebrides in the South sea. It lies about four leagues from *TANNA*, and seems to be about five leagues in circumference; it is of a considerable height, with a flat top.

IMMERETTA, or *IMERETIA*. See *IMERETIA*.

IMMERSION, that act by which any thing is plunged into water or other fluid.

It is used in chemistry for a species of calcination, when any body is immersed in a fluid to be corroded: or it is a species of lotion; as when a substance is plunged into any fluid, in order to deprive it of a bad quality, or communicate to it a good one.

IMMERSION, in *Astronomy*, is when a star or planet is so near the sun with regard to our observations, that we cannot see it; being, as it were, enveloped and hid in the rays of that luminary. It also denotes the beginning of an eclipse of the moon, or that moment when the moon begins to be darkened, and to enter into the shadow of the earth.

IMMOLATION, a ceremony used in the Roman sacrifices; it consisted in throwing upon the head of the victim some sort of corn and frankincense, together with the *mola* or salt cake, and a little wine.

IMMORTAL, that which will last to all eternity, as having in it no principle of alteration or corruption.

IMMUNITY, a privilege or exemption from some office, duty, or imposition, as an exemption from tolls, &c.

Immunity is more particularly understood of the liberties granted to cities and communities.

IMMUTABILITY, the condition of a thing that cannot change. Immutability is one of the divine attributes. See *GOD*.

IMOLA, a town of Italy, in the territory of the church, and in Romagna, with a bishop's see. It is a very handsome populous place; and is seated on the river Santerno, in E. Long. 11. 43. N. Lat. 44. 28.

IMPACT, the simple or single action of one body upon another to put it in motion. Point of impact is the place or point where a body acts.

IMPALE, in *Heraldry*, is to conjoin two coats of

arms pale-wise. Women impale their coats of arms with those of their husbands. See *HERALDRY*.

To impale cities, camps, fortifications, &c. is to inclose them with pallisades.

To *IMPALE* or *Empale*, signifies also to put to death by spitting on a stake fixed upright.

IMPALPABLE, that whose parts are so extremely minute, that they cannot be distinguished by the senses, particularly by that of feeling.

IMPANATION, a term used by divines to signify the opinion of the Lutherans with regard to the eucharist, who believe that the species of bread and wine remain together with the body of our Saviour after consecration.

IMPANNELLING, in *Law*, signifies the writing down or entering into a parchment, list, or schedule, the names of a jury summoned by the sheriff to appear for such public services as juries are employed in.

IMPARLANCE, in *Law*, a petition in court for a day to consider or advise what answer the defendant shall make to the plaintiff's action; and is the continuance of the cause till another day, or a longer time given by the court.

IMPASSIBLE, that which is exempt from suffering; or which cannot undergo pain or alteration. The Stoics place the soul of their wise men in an impassible, imperturbable state. See *APATHY*.

IMPASTATION, the mixture of various materials of different colours and consistencies, baked or bound together with some cement, and hardened either by the air or by fire.

IMPATIENS, *TOUCH-ME-NOT*, and *Balsamine*: a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 24th order, *corydales*. See *BOTANY Index*.

IMPEACHMENT, an accusation and prosecution for treason and other crimes and misdemeanours. Any member of the lower house of parliament may impeach any one belonging either to that body, or to the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is always tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an impeachment. 12 Will. III. cap. ii.

IMPECCABLES, in church history, a name given to those heretics who boasted that they were impeccable, and that there was no need of repentance: such were the Gnostics, Priscillianists, &c.

IMPECCABILITY, the state of a person who cannot sin; or a grace, privilege, or principle, which puts him out of a possibility of sinning.

The schoolmen distinguish several kinds and degrees of impeccability: that of God belongs to him by nature: that of Jesus Christ, considered as man, belongs to him by the hypostatical union: that of the blessed is a consequence of their condition: that of men is the effect of a confirmation in grace, and is rather called *impeccance* than *impeccability*; accordingly divines distinguish between these two: this distinction is found necessary in the disputes against the Pelagians, in order to explain certain terms in the Greek and Latin fathers,

Impale
||
Impecca-
bility.

Impedi-
ments
||
Imperial.

fathers, which without this distinction are easily con-
founded.

IMPEDIMENTS, in *Law*, are such hinderances as
put a stop or stay to a person's seeking for his right
by a due course of law. Persons under impediments
are those under age or coverture, *non compos mentis*,
in prison, beyond sea, &c. who, by a saving in our
laws, have time to claim and prosecute their rights,
after the impediments are removed, in case of fines lev-
ied, &c.

IMPENETRABILITY, in *Philosophy*, that prop-
erty of body, whereby it cannot be pierced by ano-
ther: thus, a body which so fills a space as to exclude
all others, is said to be impenetrable.

IMPERATIVE, one of the moods of a verb, used
when we would command, intreat, or advise: thus, *go
read, take pity, be advised*, are imperatives in our lan-
guage. But in the learned languages, this mood has
a peculiar termination to distinguish it from others,
as *i*, or *ito*, "go;" *lege*, or *legito*, "read," &c. and
not only so, but the termination varies, according as
you address one or more persons, as *audi* and *audite*;
αυτιςω, αυτιςων, αυτιςωται, &c.

IMPERATOR, in Roman antiquity, a title of
honour conferred on victorious generals by their armies,
and afterwards confirmed by the senate.

Imperator was also the title adopted by the Roman
emperors.

IMPERATORIA, **MASTERWORT**, a genus of plants
belonging to the pentandria class; and in the natural meth-
od ranking under the 45th order, *Umbellatæ*. See *BO-
TANY Index*.

IMPERFECT, something that is defective, or that
wants some of the properties found in other beings of
the same kind.

IMPERFECT Number, is that whose aliquot parts, taken
all together, do not make a sum that is equal to the
number itself, but either exceed it, or fall short of it;
being an abundant number in the former case, and a de-
fective number in the latter. Thus, 12 is an abundant
imperfect number, because the sum of all its aliquot
parts, 1, 2, 3, 4, 6, makes 16, which exceeds the num-
ber 12. And 10 is a defective imperfect number, be-
cause its aliquot parts, 1, 2, 5, taken all together, make
only 8, which is less than the number 10 itself.

IMPERFECT Tense, in *Grammar*, a tense that denotes
some preterite case, or denotes the thing to be at that
time present, and not quite finished; as *scribebam*, "I
was writing." See *GRAMMAR*.

IMPERIAL, something belonging to an emperor,
or empire. See *EMPEROR* and *EMPIRE*.—Thus we
say, his *imperial* majesty, the *imperial* crown, *imperial*
arms, &c.

IMPERIAL Crown. See *HERALDRY*.

IMPERIAL Chamber, is a sovereign court, established
for the affairs of the immediate states of the empire.
See *CHAMBER*, and *GERMANY*.

IMPERIAL Cities, in Germany, are those which own
no other head but the emperor.

These are a kind of little commonwealths; the chief
magistrate whereof does homage to the emperor, but
in other respects, and in the administration of justice, is
sovereign.

Imperial cities have a right of coining money, and
of keeping forces and fortified places. Their deputies

assist at the imperial diets, where they are divided in-
to two branches, that of the Rhine and that of Suabia.
There were formerly 22 in the former and 37 in the lat-
ter; but there are now only 48 in all.

IMPERIAL Diet, is an assembly or convention of all
the states of the empire. See *DIET* and *GERMANY*.

IMPERSONAL VERB, in *Grammar*, a verb to
which the nominative of any certain person cannot be
prefixed; or, as others define it, a verb destitute of
the two first and primary persons, as *decet, oportet*, &c.
The impersonal verbs of the active voice end in *t*, and
those of the passive in *tur*; they are conjugated through
the third person singular of almost all the tenses and
moods: they want the imperative, instead of which we
use the present of the subjunctive; as *peniteat, pugnetur*,
&c. nor, but a few excepted, are they to be met with
in the supines, participles, or gerunds.

IMPERVIOUS, a thing not to be pervaded or
passed through, either by reason of the closeness of its
pores, or the particular configuration of its parts.

IMPETIGO, in *Medicine*, an extreme roughness
and foulness of the skin, attended with an itching and
plentiful scurf.

The *impetigo* is a species of dry pruriginous itch,
wherein scales or scurf succeed apace; arising from sal-
line corrosive humours thrown out upon the exterior
parts of the body, by which means the internal parts
are usually relieved.

IMPETRATION, the act of obtaining any thing
by request or prayer.

IMPETRATION was more particularly used in our
statutes in England from the court of Rome, which did
belong to the disposal of the king and other lay patrons
of the realm; the penalty whereof is the same with that
of provisors, 25 Ed. III.

IMPETUS, in *Mechanics*, the force with which
one body strikes or impels another.

IMPLICATION, in *Law*, is where something is
implied that is not expressed by the parties themselves
in their deeds, contracts, or agreements.

To **IMPLY**, or **CARRY**, in *Music*. These we have
used as synonymous terms in that article. They are
intended to signify those sounds which ought to be
the proper concomitants of any note, whether by its
own nature, or by its position in artificial harmony.
Thus every note considered as an independent sound,
may be said to *carry* or *imply* its natural harmonics,
that is to say, its octave, its twelfth, and its seven-
teenth; or, when reduced, its eighth, its fifth, and its
third. But the same sound, when considered as consti-
tuting any part of harmony, is subjected to other laws
and different limitations. It can then only be said to
carry or *imply* such simple sounds, or complications of
sound, as the preceding and subsequent chords admit
or require. For these the laws of melody and har-
mony must be consulted. See *MELODY* and *HAR-
MONY*.

IMPORTATION, in *Commerce*, the bringing
merchandise into a kingdom from foreign countries;
in contradistinction to exportation. See *EXPORTA-
TION*.

For the principal laws relating to importation, see
Customhouse Laws.

IMPOSITION of hands, an ecclesiastical action by
which

Imperial
||
Imposition.

IMPOSSIBLE which a bishop lays his hand on the head of a person, in ordination, confirmation, or in uttering a blessing. This practice is also frequently observed by the dissenters at the ordination of their ministers, when all the ministers present place their hands on the head of him whom they are ordaining, while one of them prays for a blessing on him and his future labours. This some of them retain as an ancient practice, justified by the example of the apostles, when no extraordinary gifts are conveyed. However, they are not agreed as to the propriety of this ceremony; nor do they consider it as an essential part of ordination.

Imposition of hands was a Jewish ceremony, introduced not by any divine authority, but by custom; it being the practice among those people whenever they prayed to God for any person to lay their hands on his head.

Our Saviour observed the same custom, both when he conferred his blessing on children, and when he cured the sick; adding prayer to the ceremony. The apostles likewise laid hands on those upon whom they bestowed the Holy Ghost.—The priests observed the same custom when any one was received into their body.—And the apostles themselves underwent the imposition of hands afresh every time they entered upon any new design. In the ancient church imposition of hands was even practised on persons when they married, which custom the Abyssinians still observe.

IMPOSSIBLE, that which is not possible, or which cannot be done or effected. A proposition is said to be impossible, when it contains two ideas which mutually destroy each other, and which can neither be conceived nor united together. Thus it is impossible that a circle should be a square; because we conceive clearly that squareness and roundness destroy each other by the contrariety of their figure.

There are two kinds of impossibilities, *physical* and *moral*.

Physical impossibility is that which is contrary to the law of nature.

A thing is *morally* impossible, when of its own nature it is possible, but yet is attended with such difficulties, as that, all things considered, it appears impossible. Thus it is morally impossible that all men should be virtuous; or that a man should throw the same number with three dice a hundred times successively.

A thing which is impossible in law, is the same with a thing impossible in nature: and if any thing in a bond or deed be impossible to be done, such deed, &c. is void. 21 Car. I.

IMPOST, in *Architecture*, a capital or plinth, to a pillar or pilaster, or pier that supports an arch, &c.

IMPOST, in *Law*, signifies in general a tribute or custom, but is more particularly applied to signify that tax which the crown receives for merchandises imported into any port or haven.

IMPOSTHUME, or abscess, a collection of matter or pus in any part of the body, either owing to an obstruction of the fluids in that part, which makes them change into such matter, or to a translation of it from some other part where it was generated. See *SURGERY Index*.

IMPOSTOR, in a general sense, denotes a person who cheats by a fictitious character. Impostor

Religious IMPOSTORS, are such as falsely pretend to an extraordinary commission from heaven; and who terrify and abuse the people with false denunciations of judgments. These are punishable in the temporal courts with fine, imprisonment, and infamous corporal punishment. Imp. tency.

IMPOTENCE, or **IMPOTENCY**, in general, denotes want of strength, power, or means, to perform any thing.

Divines and philosophers distinguish two sorts of impotency; natural and moral. The first is a want of some physical principle, necessary to an action; or where a being is absolutely defective, or not free and at liberty to act: The second only imports a great difficulty; as a strong habit to the contrary, a violent passion, or the like.

IMPOTENCY is a term more particularly used for a natural inability to coition. Impotence with respect to men is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotence; as, a natural defect in the organs of generation, which seldom admits of a cure: accidents or diseases; and in such cases the impotence may or may not be remedied, according as these are curable or otherwise.—The most common causes are, early and immoderate venery, or the venereal disease. We have instances, however, of unfitness for generation in men by an impediment to the ejection of the semen in coition, from a wrong direction which the orifice at the *verumontanum* got, whereby the seed was thrown up into the bladder. M. Petit cured one patient under such a difficulty of emission, by making an incision like to that commonly made in the great operation for the stone.

On this subject we have some curious and original observations by the late Mr John Hunter in his *Treatise on the Venereal Disease* *. He considers impotency as depending upon two causes. One he refers to the mind; the other to the organs.

1. *As to impotency depending upon the mind*, he observes, that as the "parts of generation are not necessary for the existence or support of the individual, but have a reference to something else in which the mind has a principal concern; so a complete action in those parts cannot take place without a perfect harmony of body and of mind: that is, there must be both a power of body and disposition of mind; for the mind is subject to a thousand caprices, which affect the actions of these parts.

"Copulation is an act of the body, the spring of which is in the mind; but it is not volition: and according to the state of the mind, so is the act performed. To perform this act well, the body should be in health, and the mind should be perfectly confident of the powers of the body; the mind should be in a state entirely disengaged from every thing else: it should have no difficulties, no fears, no apprehensions, not even an anxiety to perform the act well; for even this anxiety is a state of mind different from what should prevail; there should not be even a fear that the mind itself may find a difficulty at the time the act should be performed. Perhaps no function of

Impotency the machine depends so much upon the state of the mind as this.

“The will and reasoning faculty have nothing to do with this power; they are only employed in the act, so far as voluntary parts are made use of: and if they ever interfere, which they sometimes do, it often produces another state of mind which destroys that which is proper for the performance of the act; it produces a desire, a wish, a hope, which are all only diffidence and uncertainty, and create in the mind the idea of a possibility of the want of success, which destroys the proper state of mind or necessary confidence.

“There is perhaps no act in which a man feels himself more interested, or is more anxious to perform well; his pride being engaged in some degree, which if within certain bounds would produce a degree of perfection in an act depending upon the will, or an act in voluntary parts; but when it produces a state of mind contrary to that state on which the perfection of the act depends, a failure must be the consequence.

“The body is not only rendered incapable of performing this act by the mind being under the above influence, but also by the mind being, though perfectly confident of its power, yet conscious of an impropriety in performing it; this, in many cases, produces a state of mind which shall take away all power. The state of a man's mind respecting his sister takes away all power. A conscientious man has been known to lose his powers on finding the woman he was going to be connected with unexpectedly a virgin.

“Shedding tears arises entirely from the state of the mind, although not so much a compound action as the act in question; for none are so weak in body that they cannot shed tears; it is not so much a compound action of the mind and strength of body joined, as the other act is; yet if we are afraid of shedding tears, or are desirous of doing it, and that anxiety is kept up through the whole of an affecting scene, we certainly shall not shed tears, or at least not so freely as would have happened from our natural feelings.

“From this account of the necessity of having the mind independent respecting the act, we must see that it may very often happen that the state of mind will be such as not to allow the animal to exert its natural powers; and every failure increases the evil. We must also see from this state of the case, that this act must be often interrupted; and the true cause of this interruption not being known, it will be laid to the charge of the body or want of powers. As these cases do not arise from real inability, they are to be carefully distinguished from such as do; and perhaps the only way to distinguish them is, to examine into the state of mind respecting this act. So trifling often is the circumstance which shall produce this inability depending on the mind, that the very desire to please shall have that effect, as in making the woman the sole object to be gratified.

“Cases of this kind we see every day; one of which I shall relate as an illustration of this subject, and also of the method of cure.—A gentleman told me, that he had lost his virility. After above an hour's investigation of the case, I made out the following facts: that he had at unnecessary times strong erections, which showed that he had naturally this power; that the erections were accompanied with desire, which are all

the natural powers wanted; but that there was still a Impotency defect somewhere, which I supposed to be from the mind. I inquired if all women were alike to him? his answer was, No; some women he could have connection with as well as ever. This brought the defect, whatever it was, into a smaller compass: and it appeared that there was but one woman that produced this inability, and that it arose from a desire to perform the act with this woman well; which desire produced in the mind a doubt or fear of the want of success, which was the cause of the inability of performing the act. As this arose entirely from the state of the mind produced by a particular circumstance, the mind was to be applied to for the cure; and I told him that he might be cured, if he could perfectly rely on his own power of self-denial. When I explained what I meant, he told me that he could depend upon every act of his will or resolution. I then told him, that, if he had a perfect confidence in himself in that respect, he was to go to bed to this woman, but first promise to himself that he would not have any connection with her for six nights, let his inclinations and powers be what they would; which he engaged to do, and also to let me know the result. About a fortnight after, he told me, that this resolution had produced such a total alteration in the state of his mind, that the power soon took place; for instead of going to bed with the fear of inability, he went with fears that he should be possessed with too much desire, too much power, so as to become uneasy to him; which really happened; for he would have been happy to have shortened the time; and when he had once broke the spell, the mind and powers went on together, and his mind never returned to its former state.”

2. *Of impotency from a want of proper correspondence between the actions of the different organs.* Our author, in a former part of his Treatise, when considering the diseases of the urethra and bladder, had remarked, that every organ in an animal body, without exception, was made of different parts, whose functions or actions were totally different from one another, although all tending to produce one ultimate effect. In all such organs, when perfect (he observes), there is a succession of motions, one naturally arising out of the other, which in the end produces the ultimate effect; and an irregularity alone in these actions will constitute disease, at least will produce very disagreeable effects, and often totally frustrate the intention of the organ. This principle Mr Hunter, on the present occasion, applies to the “actions of the testicles and penis: for we find that an irregularity in the actions of these parts sometimes happens in men, producing impotence; and something similar probably may be one cause of barrenness in women.

“In men, the parts subservient to generation may be divided into two; the essential and the accessory. The testicles are the essential; the penis, &c. the accessory. As this division arises from their uses or actions in health, which exactly correspond with one another, a want of exactness in the correspondence or susceptibility of those actions may also be divided into two: where the actions are reversed, the accessory taking place without the first or essential, as in erections of the penis, where neither the mind nor the testicles are stimulated to action; and the second is where the testicles perform

Impotency. the action of secretion too readily for the penis, which has not a corresponding erection. The first is called *priapism*; and the second is what ought to be called *seminal weakness*.

“The mind has considerable effect on the correspondence of the actions of these two parts: but it would appear in many instances, that erections of the penis depend more on the state of the mind than the secretion of the semen does; for many have the secretion, but not the erection; but in such, the want of erection appears to be owing to the mind only.

“Priapism often arises spontaneously; and often from visible irritation of the penis, as in the venereal gonorrhœa, especially when violent. The sensation of such erections is rather uneasy than pleasant; nor is the sensation of the glans at the time similar to that arising from the erections of desire, but more like to the sensation of the parts immediately after coition. Such as arise spontaneously are of more serious consequence than those from inflammation, as they proceed probably from causes not curable in themselves or by any known methods. The priapism arising from inflammation of the parts, as in a gonorrhœa, is attended with nearly the same symptoms; but generally the sensation is that of pain, proceeding from the inflammation of the parts. It may be observed, that what is said of priapism is only applicable to it when a disease is itself, and not when a symptom of other diseases, which is frequently the case.

“The common practice in the cure of this complaint is to order all the nervous and strengthening medicines; such as bark, valerian, nutk, camphor, and also the cold bath. I have seen good effects from the cold bath; but sometimes it does not agree with the constitution, in which case I have found the warm bath of service. Opium appears to be a specific in many cases; from which circumstance I should be apt, upon the whole, to try a soothing plan.

“Seminal weakness, or a secretion and emission of the semen without erections, is the reverse of a priapism, and is by much the worse disease of the two. There is great variety in the degrees of this disease, there being all the gradations from the exact correspondence of the actions of all the parts to the testicles acting alone; in every case of the disease, there is too quick a secretion and evacuation of the semen. Like to the priapism, it does not arise from desires and abilities; although when mild it is attended with both, but not in a due proportion; a very slight desire often producing the full effect. The secretion of the semen shall be so quick, that simple thought, or even toying, shall make it flow.

“Dreams have produced this evacuation repeatedly in the same night; and even when the dreams have been so slight, that there has been no consciousness of them when the sleep has been broken by the act of emission. I have known cases where the testicles have been so ready to secrete, that the least friction on the glans has

produced an emission: I have known the same action *Impotency.* of walking or riding produce this effect, and that repeatedly, in a very short space of time.

“A young man, about four or five and twenty years of age, not so much given to venery as most young men, had these last mentioned complaints upon him. Three or four times in the night he would emit; and if he walked fast, or rode on horseback, the same thing would happen. He could scarcely have connection with a woman before he emitted, and in the emission there was hardly any spasm. He tried every supposed strengthening medicine, as also the cold bath and sea-bathing, but with no effect. By taking 20 drops of laudanum on going to bed, he prevented the night emissions; and by taking the same quantity in the morning, he could walk or ride without the before-mentioned inconvenience. I directed this practice to be continued for some time, although the disease did not return, that the parts might be accustomed to this healthy state of action; and I have reason to believe the gentleman is now well. It was found necessary, as the constitution became more habituated to the opiate, to increase the dose of it.

“The spasms, upon the evacuation of the semen in such cases, are extremely slight, and a repetition of them soon takes place; the first emission not preventing a second; the constitution being all the time but little affected (A). When the testicles act alone, without the accessory parts taking up the necessary and natural consequent action, it is still a more melancholy disease; for the secretion arises from no visible or sensible cause, and does not give any visible or sensible effect, but runs off similar to involuntary stools or urine. It has been observed that the semen is more fluid than natural in some of these cases.

“There is great variety in the diseased actions of these parts; of which the following case may be considered as an example. A gentleman has had a stricture in the urethra for many years, for which he has frequently used a bougie, but of late has neglected it. He has had no connection with women for a considerable time, being afraid of the consequences. He has often in his sleep involuntary emissions, which generally awake him at the paroxysm; but what surprises him most is, that often he has such without any semen passing forwards through the penis, which makes him think that at those times it goes backwards into the bladder. This is not always the case, for at other times the semen passes forwards. At the time the semen seems to pass into the bladder, he has the erection, the dream; and is awaked with the same mode of action, the same sensation, and the same pleasure, as when it passes through the urethra, whether dreaming or waking. My opinion is, that the same irritation takes place in the bulb of the urethra without the semen that takes place there when the semen enters, in consequence of all the natural preparatory steps, where-by the very same actions are excited as if it came into the

(A) “It is to be considered, that the constitution is commonly affected by the spasms only, and in proportion to their violence, independent of the secretion and evacuation of the semen. But in some cases even the erection going off without the spasms on the emission, shall produce the same debility as if they had taken place.”

Impotency
||
Impressing.

the passage. from which one would suppose, that either semen is not secreted; or if it be, that a retrograde motion takes place in the actions of the acceleratores urine. But if the first be the case, then we may suppose, that in the natural state the actions of those muscles do not arise simply from the stimulus of the semen in the part, but from their action being a termination of a preceding one making part of a series of actions. Thus they may depend upon the friction, or the imagination of a friction, on the penis; the testicles not doing their part, and the spasm in such cases arising from the friction and not from the secretion. In many of these cases of irregularity, when the erection is not strong, it shall go off without the emission; and at other times an emission shall happen almost without an erection; but these arise not from debility, but affections of the mind.

“In many of the preceding cases, washing the penis, scrotum, and perinæum, with cold water, is often of service; and to render it colder than it is in some seasons of the year, common salt may be added to it, and the parts washed when the salt is almost dissolved.”

IMPOTENCY is a canonical disability, to avoid marriage in the spiritual court. The marriage is not void *ab initio*, but voidable only by sentence of separation during the life of the parties.

IMPRECATION, (derived from *in*, and *precor*, “I pray;”) a curse or wish that some evil may befall any one.

The ancients had their goddesses called *Imprecations*, in Latin *Diræ*, i. e. *Deorum diræ*, who were supposed to be the executioners of evil consciences. They were called *Diræ* in heaven, *Furiet* on earth, and *Eumenides* in hell. The Romans owned but three of these *Imprecations*, and the Greeks only two. They invoked them with prayers and pieces of verses to destroy their enemies.

IMPREGNATION, the getting a female with child. See CONCEPTION.

The term *impregnation* is also used, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digestion, &c.

IMPRESSING SEAMEN. The power of impressing sea-faring men for the sea-service by the king's commission, has been a matter of some dispute, and submitted to with great reluctance; though it hath very clearly and learnedly been shown by Sir Michael Foster, that the practice of impressing, and granting powers to the admiralty for that purpose, is of very ancient date, and hath been uniformly continued by a regular series of precedents to the present time: whence he concludes it to be part of the common law. The difficulty arises from hence, that no statute has expressly declared this power to be in the crown, though many of them very strongly imply it. The statute 2 Rich. II. c. 4. speaks of mariners being arrested and retained for the king's service, as of a thing well known, and practised without dispute; and provides a remedy against their running away. By a later statute, if any waterman, who uses the river Thames, shall hide himself during the execution of any commission of pressing for the king's service, he is liable to heavy penalties. By another (5 Eliz. c. 5.) no fisherman shall be taken by the queen's commission to serve as a mariner; but the com-

mission shall be first brought to two justices of the peace, inhabiting near the sea coast where the mariners are to be taken, to the intent that the justices may choose out and return such a number of able-bodied men, as in the commission are contained, to serve her majesty. And by others, especially protections are allowed to seamen in particular circumstances, to prevent them from being impressed. Ferry-men are also said to be privileged from being impressed, at common law. All which do most evidently imply a power of impressing to reside somewhere; and if anywhere, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, reside in the crown alone. — After all, however, this method of manning the navy is to be considered as only defensible from public necessity, to which all private considerations must give way.

The following persons are exempted from being impressed: Apprentices for three years: the master, mate, and carpenter, and one man for every 100 tons, of vessels employed in the coal trade; all under 18 years of age, and above 55; foreigners in merchant-ships and privateers; landmen betaking themselves to sea for two years; seamen in the Greenland fishery, and harpooners, employed, during the interval of the fishing season, in the coal-trade, and giving security to go to the fishing next season.

IMPRESSION is applied to the species of objects which are supposed to make some mark or impression on the senses, the mind, and the memory. The Peripatetics assert, that bodies emit species resembling them, which are conveyed to the common *sensorium*, and they are rendered intelligible by the active intellect; and, when thus spiritualized, are called *expressions*, or *express species*, as being expressed from the others.

IMPRESSION also denotes the *edition* of a book, regarding the mechanical part only; whereas *edition*, besides this, takes in the care of the editor, who corrects or augmented the copy, adding notes, &c. to render the work more useful.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another.

No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of some force and violence, for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute exactly pursues the statute in the manner of doing it; for otherwise it will be deemed false imprisonment, and of consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, “till delivered by due course of law,” and “not until farther order;” which has been held ill: and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed. See ARREST and COMMITMENT.

False IMPRISONMENT. Every confinement of the person is an imprisonment, whether it be in a common prison, or in a private house, or in the stocks, or even

Impressio
Imprison-
ment.

prison-
ment
||
purity.

by forcibly detaining one in the public streets. Unlawful or *false imprisonment* consists in such confinement or detention without sufficient authority: which authority may arise either from some process from the courts of justice; or from some warrant from a legal power to commit, under his hand and seal, and expressing the cause of such commitment; or from some other special cause warranted, for the necessity of the thing, either by common law or act of parliament; such as the arresting of a felon by a private person without warrant, the impressing of mariners for the public service, or the apprehending of waggoners for misbehaviour in the public highways. False imprisonment also may arise by executing a lawful warrant or process at an unlawful time, as on a Sunday; or in a place privileged from arrests, as in the verge of the king's court. This is the injury. The remedy is of two sorts; the one removing the injury, the other *making satisfaction* for it.

The means of removing the actual injury of false imprisonment are fourfold: 1. By writ of *MAINPRIZE*. 2. By writ *De ODIO et Atia*. 3. By writ *De HOMINE Replegiando*. 4. By writ of *HABEAS Corpus*. See those articles.

The *satisfactory* remedy for this injury of false imprisonment, is by an action of trespass *vi et armis*, usually called an *action of false imprisonment*; which is generally, and almost unavoidably, accompanied with a charge of assault and battery also: and therein the party shall recover damages for the injuries he has received; and also the defendant is, as for all other injuries committed with force, or *vi et armis*, liable to pay a fine to the king for the violation of the public peace.

IMPROMPTU, or *INPROMPTU*, a Latin word frequently used among the French, and sometimes in English, to signify a piece made off-hand, or *extempore*, without any previous meditation, by mere force and vivacity of imagination.

IMPROBATION, in *Scots Law*, the name of any action brought for setting any deed or writing aside upon the head of forgery.

IMPROPRIATION, in ecclesiastical law. See *APPROPRIATION*.

IMPULSION, in *Mechanical Philosophy*, a term employed for expressing a supposed peculiar exertion of the powers of body, by which a moving body changes the motion of another body by hitting or striking it. The plainest case of this action is when a body in motion hits another body at rest, and puts it in motion by the stroke. The body thus put in motion is said to be *IMPULLED* by the other; and this way of producing motion is called *IMPULSION*, to distinguish it from *PRESSION*, *THRUSTING*, or *PROTRUSION*, by which we push a body from its place without striking it. The term has been gradually extended to every *change* of motion occasioned by the collision of bodies. See *MECHANICS*.

IMPURITY, in the law of Moses, is any legal defilement. Of these there were several sorts. Some were voluntary, as the touching a dead body, or any animal that died of itself, or any creature that was esteemed unclean; or the touching things holy, by one who was not clean, or was not a priest; the touching one who had a leprosy, one who had a gonorrhœa, or who was polluted by a dead carcase, &c. Sometimes

these impurities were involuntary; as when any one inadvertently touched bones, or a sepulchre, or any thing polluted; or fell into such diseases as pollute, as the leprosy, &c.

Impurity
||
Inaniry.

The beds, clothes, and moveables, which had touched any thing unclean, contracted also a kind of impurity, and in some cases communicated it to others.

These legal pollutions were generally removed by bathing, and lasted no longer than the evening. The person polluted plunged over head in the water, and either had his clothes on when he did so, or washed himself and his clothes separately. Other pollutions continued seven days, as that which was contracted by touching a dead body. That of women in their monthly courses lasted till this was over with them. Other impurities lasted 40 or 50 days; as that of women who were lately delivered, who were unclean 40 days after the birth of a boy, and 50 after the birth of a girl. Others again lasted till the person was cured.

Many of these pollutions were expiated by sacrifices; and others by a certain water or ley made with the ashes of a red heifer, sacrificed on the great day of expiation. When the leper was cured, he went to the temple, and offered a sacrifice of two birds, one of which was killed and the other set at liberty. He who had touched a dead body, or had been present at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if she was poor, two turtles or two young pigeons.

These impurities, which the law of Moses has expressed with the greatest accuracy and care, were only figures of other more important impurities, such as the sins and iniquities committed against God, or faults committed against our neighbour. The saints and prophets of the Old Testament were sensible of this; and our Saviour, in the gospel, has strongly inculcated, that they are not outward and corporeal pollutions which render us unacceptable to God, but such inward pollutions as infect the soul, and are violations of justice, truth, and charity.

IMPUTATION, in general, the charging some thing to the account of one which belonged to another: thus, the assertors of original sin maintain, that Adam's sin is imputed to all his posterity.

In the same sense, the righteousness and merits of Christ are imputed to true believers.

INACCESSIBLE, something that cannot be approached, by reason of intervening obstacles, as a river, rock, &c. It is chiefly used in speaking of heights and distances. See *MENSURATION*.

INACHUS, founder of the kingdom of Argos, 1856 B. C. See *ARGOS*.

INALIENABLE, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the estates of a minor, &c. are inalienable, otherwise than with a reserve of the right of redemption.

INANIMATE, a body that has either lost its soul, or that is not of a nature capable of having any.

INANITION, among physicians, denotes the state of the stomach when empty, in opposition to repletion.

INANITY, the school term for emptiness or absolute

Inarching
||
Incarnat-
tion.

solute vacuity, and implies the absence of all body and matter whatsoever; so that nothing remains but mere space.

INARCHING, in *Gardening*, a method of grafting, commonly called *grafting by approach*. See **GARDENING Index**.

INAUGURATION, the coronation of an emperor or king, or the consecration of a prelate: so called from the ceremonies used by the Romans, when they where received into the college of augurs.

INCA, or **YNCA**, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieca, in his *Chronicles of Peru*, gives the origin of the incas; and says, that that country was, for a long time, the theatre of all manner of crimes, of war, dissension, and the most dreadful disorders, till at last two brothers appeared, one of whom was called *Mangocapa*; of this person the Peruvians relate many wonderful stories. He built the city of Cusco, made laws, established order and harmony by his wise regulations; and he and his descendants took the name of *inca*, which signifies king or great lord. These incas became so powerful, that they rendered themselves masters of all the country from Pasco to Chili, and from the river Maule on the south to the river Augasmago on the north; these two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the divisions between Inca Guascar and Atabalipa; which the Spaniards laying hold of, made themselves masters of the country, and destroyed the empire of the incas. See **PERU**.

INCAMERATION, a term used in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope's domain.

INCANTATION, denotes certain ceremonies, accompanied with a formula of words, and supposed to be capable of raising devils, spirits, &c. See **CHARM**, &c.

INCAPACITY, in the canon-law, is of two kinds: 1. The want of a dispensation for age in a minor, for legitimation in a bastard, and the like: this renders the provision of a benefice void in its original. 2. Crimes and heinous offences, which annul provisions at first valid.

INCARNATION, in *Theology*, signifies the act whereby the Son of God assumed the human nature; or the mystery by which Jesus Christ, the eternal word, was made man, in order to accomplish the work of our salvation. The era used among Christians, whence they number their years, is the time of the incarnation, that is, of Christ's conception in the virgin's womb.

This era was first established by Dionysius Exiguus, about the beginning of the sixth century, till which time the era of Dioclesian had been in use.

Some time after this, it was considered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occasioned them to postpone the beginning of this era for the space of one year, retaining the cycle of Dionysius entire in every thing else.

At Rome they reckon their years from the incarnation or birth of Christ, that is, from the 25th of December, which custom has obtained from the year

1431. In France, and several other countries, they also reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it, after the primitive manner, not to the day of the birth, but conception of our Saviour; though the Florentines retain the day of the birth, and begin their year from Christmas.

INCARNATION (formed from *in* and *caro* "flesh,") in *Surgery*, signifies the healing and filling up of ulcers and wounds with new flesh. See **SURGERY**.

INCARNATIVES, in *Surgery*, medicines which were supposed to assist nature in filling up wounds or ulcers with flesh.

INCENDIARY, in *Law*, is applied to one who is guilty of maliciously setting fire to another's dwelling-house, and all outhouses that are parcel thereof, though not contiguous to it, or under the same roof, as barns and stables. A bare intent or attempt to do this, by actually setting fire to a house, unless it absolutely burns, does not fall within the description of *incendit et combussit*. But the burning and consuming of any part is sufficient; though the fire be afterwards extinguished. It must also be a malicious burning; otherwise it is only a trespass. This offence is called *arson* in our law.

Among the ancients, criminals of this kind were to be burnt. *Qui ædes, acervumque frumenti juxta domum positum sciens, prudensque dolo malo combusserit, vinculus igni necatur*.

The punishment of *arson* was death by our ancient Saxon laws and by the Gothic constitutions: and in the reign of Edward I. incendiaries were burnt to death. The stat. 8 Hen. VI. c. 6. made the wilful burning of houses, under special circumstances, high treason; but it was reduced to felony by the general acts of Edward VI. and Queen Mary. This offence was denied the benefit of clergy by 21 Hen. VIII. c. 1. which statute was repealed by 1 Edw. VI. c. 12.; and arson was held to be ousted of clergy, with respect to the principal, by inference from the stat. 4 and 5 P. and M. c. 4. which expressly denied it to the accessory; though now it is expressly denied to the principal also, by 9 Geo. I. c. 22.

INCENCE, or **FRANKINCENSE**, in the *Materia Medica*, &c. a dry resinous substance, known among authors by the names **THUS** and **OLIBANUM**.

Incense is a rich perfume, with which the Pagans and the Roman Catholics still perfume their temples, altars, &c.—The word comes from the Latin *incensum*, q. d. *burnt*; as taking the effect for the thing itself.

The burning of incense made part of the daily service of the ancient Jewish church. The priests drew lots to know who should offer it: the destined person took a large silver dish, in which was a censer full of incense; and being accompanied by another priest carrying some live coals from the altar, went into the temple. There, in order to give notice to the people, they struck upon an instrument of brass placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incense having said a prayer or two, waited the signal, which was the burning of the holocaust; immediately upon which he set fire to the incense, the whole multitude continuing

Incarnat-
tion
||
Incense.

Inceptive all the time in prayer. The quantity of incense offered each day was half a pound in the morning and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims that were continually offered up, would have made the temple smell like a slaughter-house, and consequently have inspired the comers rather with disgust and aversion, than awe and reverence, had it not been overpowered by the agreeable fragrance of those perfumes.

INCEPTIVE, a word used by Dr Wallis to express such moments, or first principles, which, though of no magnitude themselves, are yet capable of producing such as are. Thus a point has no magnitude itself, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCEST, the crime of venereal commerce between persons who are related in a degree wherein marriage is prohibited by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection so necessary in marriage might be heightened by this double tie: yet the rules of this church have formerly extended this prohibition even to the seventh degree; but time has now brought it down to the third or fourth degree.

Most nations look on incest with horror, Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with instances of the brother's marrying the sister; the reason was, because they thought it too mean to join in alliance with their own subjects, and still more so to have married into any foreign family.

INCEST Spiritual, a crime committed in like manner between persons who have a spiritual alliance by means of baptism or confirmation.

Spiritual incest is also understood of a vicar, or other beneficiary, who enjoys both the mother and daughter; that is, holds two benefices, the one whereof depends upon the collation of the other.

Such a spiritual incest renders both the one and the other of these benefices vacant.

INCH, a well-known measure of length; being the twelfth part of a foot, and equal to three barley-corns in length.

Inch of Candle, (sale by). See **CANDLE**.

INCH (contracted from the Gaelic *innis* "an island"), a word prefixed to the names of different places in Scotland and Ireland.

INCH Colm or **Columba**, the isle of Columba, an island situated in the frith of Forth in Scotland, and famous for its monastery. See **FORTH**.

This monastery was founded about 1123, by Alexander I. on the following occasion. In passing the frith of Forth he was overtaken with a violent storm, which drove him to this island, where he met with the most hospitable reception from a poor hermit, then residing here in the chapel of St Columba, who, for the three days that the king remained there tempest-bound, entertained him with the milk of his cow, and a few shell-fish. His majesty, from the sense of the danger he had escaped, and in gratitude to the saint to whom

he attributed his safety, vowed some token of respect; and accordingly founded here a monastery of Augustines, and dedicated it to St Columba. Allan de Mortimer, lord of Aberdour, who attended Edw. III. in his Scotch expedition, bestowed half of those lands on the monks of this island, for the privilege of a family burial-place in their church. The buildings made in consequence of the piety of Alexander were very considerable. There are still to be seen a large square tower belonging to the church, the ruins of the church, and of several other buildings. The wealth of this place in the time of Edward III. proved so strong a temptation to his fleet, then lying in the Forth, as to suppress all the horror of sacrilege and respect to the sanctity of the inhabitants. The English landed, and spared not even the furniture more immediately consecrated to divine worship. But due vengeance overtook them; for in a storm which instantly followed, many of them perished; those who escaped, struck with the justice of the judgment, vowed to make ample recompense to the injured saint. The tempest ceased; and they made the promised atonement.—The Danish monument, figured by Sir Robert Sibbald, lies on the south-east side of the building, on a rising ground. It is of a rigid form, and the surface ornamented with scale-like figures. At each end is the representation of a human head.

INCH Keith, a small island situated in the same frith, midway between the port of Leith and Kinghorn on the opposite shore. See **FORTH**.

This island is said to derive its name from the gallant Keith who so greatly signalized himself by his valour in 1010, in the battle of Barry, in Angus, against the Danes; after which he received in reward the barony of Keith, in Lothian, and this little isle. In 1549 the English fleet, sent by Edward VI. to assist the lords of the congregation against the queen-dowager, landed, and began to fortify this island, of the importance of which they grew sensible after their neglect of securing the port of Leith, so lately in their power. They left here five companies to cover the workmen under the command of Cotterel; but their operations were soon interrupted by M. Desse, general of the French auxiliaries, who took the place, after a gallant defence on the part of the English. The Scots kept possession for some years; but at last the fortifications were destroyed by act of parliament, to prevent it from being of any use to the former. The French gave it the name of *L'isle des chevaux*, from its property of soon fattening horses.—In 1497, by order of council, all venereal patients in the neighbourhood of the capital were transported there to prevent their disease from spreading, *ne quid detrimenti respublica caperet*. A lighthouse, which must prove highly beneficial to the shipping which frequent the Forth, was erected in 1805.

INCH Garvie, a small island, also lying in the frith of Forth, near Queensferry. See **FORTH**.

INCHANTMENT. See **WITCHCRAFT**.

INCHOATIVE, a term signifying the beginning of a thing or action; the same with what is otherwise called *inceptive*.

INCHOATIVE verbs, denote, according to Priscian and other grammarians, verbs that are characterized by the

Inch Keith.
Inch active verbs.

Incidence termination *see* or *scor*, added to their primitives: as *augeo* from *augere*, *caleo* from *caleo*, *dulcesco* from *dulcis*, *irascor* from *ira*, &c.

Incombustible cloth.

INCIDENCE, denotes the direction in which one body strikes on another. See **OPTICS** and **MECHANICS**.
Angle of INCIDENCE. See **ANGLE**.

INCIDENT, in a general sense, denotes an event, or a particular circumstance of some event.

INCIDENT, in *Law*, is a thing appertaining to, or following another that is more worthy or principal. A court baron is inseparably incident to a manor; and a court of pie powders to a fair.

INCIDENT Diligence, in *Scots Law*, a warrant granted by a lord ordinary in the court of session for citing witnesses for proving any point, or for production of any writing necessary for preparing the cause for a final determination, or before it goes to a general proof.

INCIDENT, in a poem, is an episode, or particular action, joined to the principal action, or depending on it.

A good comedy is to be full of agreeable incidents, which divert the spectators, and form the intrigue. The poet ought always to make choice of such incidents as are susceptible of ornament suitable to the nature of his poem. The variety of incidents well conducted makes the beauty of an heroic poem, which ought always to take in a certain number of incidents to suspend the catastrophe, that would otherwise break out too soon.

INCINERATION, (derived from *in*, and *cinis*, "ashes,") in chemistry, the reduction of any substance into ashes by burning.

INCISIVE, an appellation given to whatever cuts or divides: thus, the fore teeth are called *dentes incisivi*, or cutters; and medicines of an attenuating nature, incidents, or incisive medicines.

INCLE, a kind of tape made of linen yarn.

INCLINATION, is a word frequently used by mathematicians, and signifies the mutual approach, tendency, or leaning of two lines or two planes towards each other, so as to make an angle.

INCLINATION, in a moral sense. See **APPETITE**.

INCLINED PLANE, in *Mechanics*, one that makes an oblique angle with the horizon. See **MECHANICS**.

INCOGNITO, or **INCOG**, is applied to a person who is in any place where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train or the usual marks of their distinction and quality.

INCOMBUSTIBLE CLOTH. See **ASBESTOS**, **MINERALOGY Index**. On this Cronstedt observes, that the natural fibre of the asbesti is in proportion to their economical use, both being very inconsiderable. "It is an old tradition (says he), that in former ages they made clothes of the fibrous asbesti, which is said to be composed by the word *byssus*; but it is not very probable, since if one may conclude from some trifles now made of it, as bags, ribbons, and other things, such a dress could neither have an agreeable appearance, nor be of any convenience or advantage. It is more probable that the Scythians dressed their dead bodies which were to be burned, in a cloth manufactured of this stone; and this perhaps has occasioned the above

fable." M. Magellan confirms this opinion of Cronstedt's, and informs us that some of the Romans also inclosed dead bodies in cloth of this kind. In the year 1756 or 1757 he tells us, that he saw a large piece of asbestos cloth found in a stone tomb, with the ashes of a Roman, as appeared by the epitaph. It was kept, with the tomb also, if our author remembers rightly, in the right-hand wing of the Vatican library at Rome. The under-librarian, in order to show that it was incombustible, lighted a candle, and let some drops of wax fall on the cloth, which he set on fire with a candle in his presence without any detriment to the cloth. Its texture was coarse, but much softer than he could have expected.

INCOMBUSTIBLE, something that cannot be burnt or consumed by fire. See **ASBESTOS**.

INCOMMENSURABLE, a term in *Geometry*, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE Numbers, are such as have no common divisor that will divide them both equally.

INCOMPATIBLE, that which cannot subsist with another without destroying it: thus cold and heat are incompatible in the same subject, the strongest overcoming and expelling the weakest.

INCONTINENCE, inordinacy of the sexual appetite; lust. It is the opposite of chastity. See **CHASTITY** and **CONTINENCE**.

INCONTINENCE, in the eye of law, is of divers kinds; as in cases of bigamy, rapes, sodomy, or buggery, getting bastards; all which are punished by statute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. Incontinency of priests is punishable by the ordinary, by imprisonment, &c. 1 Hen VII. cap. 4.

INCONTINENCE, in *Medicine*, signifies an inability in any of the organs to retain what should not be discharged without the concurrence of the will. It is most frequently applied to an involuntary discharge of urine. See **MEDICINE Index**.

INCORPORATION, in *Pharmacy*, is the reduction of dry substances to the consistence of a paste, by the admixture of some fluid: thus pills, boles, &c. are made by incorporation.

INCORPORATION, or *Body-Corporate*. See **CORPORATION**.

INCORPOREAL, spiritual; a thing, or substance, which has no body. Thus the soul of man is incorporeal, and may subsist independent of the body. See **METAPHYSICS**.

INCORRUPTIBLE, that which cannot be corrupted. Thus spiritual substances, as angels, human souls, &c. and thus also, glass, gold, mercury, &c. may be called *incorruptible*.

INCORRUPTIBLES, **INCORRUPTIBLES**, the name of a sect which sprang out of the Eutychians.—Their distinguishing tenet was, that the body of Jesus Christ was incorruptible; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c. so that he

crassatingate without any occasion, before his death, as well as after his resurrection. And hence it was that they took their name.

INCRASSATING, in *Pharmacy*, &c. the rendering of fluids thicker by the mixture of other substances less fluid, or by the evaporation of the thinner parts.

INCUBATION, the action of a hen, or other fowl, brooding on her eggs. See **HATCHING**.

INCUBUS, NIGHT-MARE, a disease consisting in an oppression of the breast, so very violent, that the patient cannot speak or even breathe. The word is derived from the Latin *incubare*, to "lie down" on any thing and press it: the Greeks call it *επιπληξ*; q. d. *saltaior*, "leaper," or one that rusheth on a person.

In this disease the senses are not quite lost, but drowned and astonished, as is the understanding and imagination; so that the patient seems to think some huge weight thrown on him, ready to strangle him. Children are very liable to this distemper; so are fat people, and men of much study and application of mind: by reason the stomach in all these finds some difficulty in digestion.

INCUMBENT, a clerk or minister who is resident on his benefice; he is called *incumbent*, because he does, or at least ought to, bend his whole study to discharge the cure of his church.

INCURVATION of the RAYS of LIGHT, their bending out of a rectilinear straight course, occasioned by refraction. See **OPTICS**.

INCUS, in *Anatomy*, a bone of the internal ear, somewhat resembling one of the anterior dentes molares. See **ANATOMY**, N^o 141.

INDEFEASIBLE, a term in law for what cannot be defeated or made void; as an indefeasible estate of inheritance, &c.

INDEFEASIBLE Right to the Throne. See **HEREDITARY Right**.

INDEFINITE, that which has no certain bounds, or to which the human mind cannot affix any.

INDEFINITE, in *Grammar*, is understood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate sense, and not fixed to any particular time, thing, or other circumstance.

INDELIBLE, something that cannot be cancelled or effaced.

INDEMNITY, in *Law*, the saving harmless; or a writing to secure one from all damage and danger that may ensue from any act.

INDEDENTED, in *Heraldry*, is when the outline of an ordinary is notched like the teeth of a saw.

INDENTURE, in *Law*, a writing which comprises some contract between two at least; being indented at top, answerable to another part which has the same contents. See **DEED**.

INDEPENDENTS, a sect of Protestants so called from their maintaining that each congregation of Christians, which meets in one house for public worship, is a complete church, has sufficient power to act and perform every thing relating to religious government within itself, and is in no respect subject or accountable to other churches.

The Independents, like every other Christian sect, derive their own origin from the practice of the apostles in planting the first churches; but they were unknown in modern times till they arose in England during the reign of Elizabeth. The hierarchy established by that prince in the churches of her dominions, the vestments worn by the clergy in the celebration of divine worship, the book of common prayer, and above all the sign of the cross used in the administration of baptism, were very offensive to many of her subjects, who during the persecution of the former reign had taken refuge among the Protestants of Germany and Geneva. Those men thought that the church of England resembled, in too many particulars, the antichristian church of Rome; and they called perpetually for a more thorough reformation and a purer worship. From this circumstance they were stigmatized by their adversaries with the general name of *Puritans*, as the followers of Novatian (A) had been in the ancient church. Elizabeth was not disposed to comply with their demands; and it is difficult to say what might have been the issue of the contest, had the Puritans been united among themselves in sentiments, views, and measures. But the case was quite otherwise. That large body, composed of persons of different ranks, characters, opinions, and intentions, and unanimous in nothing but in their antipathy to the forms of doctrine and discipline that were established by law, was all of a sudden divided into a variety of sects. Of these the most famous was that which was formed about the year 1581 by *Robert Brown*, a man insinuating in his manners, but unsteady and inconsistent in his views and notions of men and things. See **BROWN**.

This innovator differed not in point of doctrine either from the church of England, or from the rest of the Puritans; but he had formed notions then new and singular concerning the nature of the church and the rules of ecclesiastical government. He was for dividing the whole body of the faithful into separate societies or congregations; and maintained, that such a number of persons as could be contained in an ordinary place of worship ought to be considered as a church, and enjoy all the rights and privileges that are competent to an ecclesiastical community. These small societies he pronounced *independent jure divino*, and entirely exempt from the jurisdiction of the bishops, in whose hands the court had placed the reins of spiritual government; and also from that of presbyteries

Z 2

and

(A) The followers of Novatian were called *Puritans*, because they would not communicate with the Catholic church, under pretence that her communion was polluted by admitting those to the sacred mysteries who through infirmity had sacrificed to idols in times of persecution. These unhappy men were not received by the church till after a long course of penance. The Novatians would not receive them at all, however long their penance, or however sincere their sorrow, for their sin. In other respects, the ancient Puritans were, like the English, orthodox in the faith, and of irreproachable morals.

Independents.

and synods, which the Puritans regarded as the supreme visible sources of ecclesiastical authority. He also maintained, that the power of governing each congregation resided in the people; and that each member had an equal share in this government, and an equal right to order matters for the good of the whole society. Hence all points both of doctrine and discipline were submitted to the discussion of the whole congregation; and whatever was supported by a majority of voices passed into a law. It was the congregation also that elected certain of the brethren to the office of pastors, to perform the duty of public instruction, and the several branches of divine worship; reserving, however, to themselves the power of dismissing these ministers, and reducing them to the condition of private members, whenever they should think such a change conducive to the spiritual advantage of the community. It is likewise to be observed, that the right of the pastors to preach was by no means of an exclusive nature, or peculiar to them alone; since any member that thought proper to exhort or instruct the brethren, was abundantly indulged in the liberty of *prophesying* to the whole assembly. Accordingly, when the ordinary teacher or pastor had finished his discourse, all the other brethren were permitted to communicate in public their sentiments and illustrations upon any useful or edifying subject.

The zeal with which BROWN and his associates maintained and propagated these notions was in a high degree intemperate and extravagant. He affirmed, that all communion was to be broken off with those religious societies that were founded upon a different plan from his; and treated, more especially the church of England, as a spurious church, whose ministers were unlawfully ordained, whose discipline was popish and antichristian, and whose sacraments and institutions were destitute of all efficacy and virtue. The sect of this hot-headed innovator, not being able to endure the severe treatment which their own violence had brought upon them from an administration that was not distinguished by its mildness and indulgence, retired into the Netherlands, and founded churches at Middlebourg in Zealand, and at Amsterdam and Leyden in the province of Holland; but their establishments were neither solid nor lasting. Their founder returned into England; and having renounced his principles of separation, took orders in the established church, and obtained a benefice. The Puritan exiles, whom he thus abandoned, disagreed among themselves, were split into parties, and their affairs declined from day to day. This engaged the wiser part of them to mitigate the severity of their founder's plan, and to soften the rigour of his uncharitable decisions.

And progress.

The persons who had the chief merit of bringing about this reformation was one of their pastors called *John Robinson*, a man who had much of the solemn piety of the times, and no inconsiderable portion of learning. This well-meaning reformer, perceiving the defects that reigned in the discipline of Brown, and in the spirit and temper of his followers, employed his zeal and diligence in correcting them, and in new-modelling the society in such a manner as to render it less odious to its adversaries, and less liable to the just censure of those true Christians, who looked upon charity as the end of the commandments. Hitherto the

sect had been called *Brownists*; but Robinson having, in his Apology, affirmed, *Cætum quemlibet particularem, esse totam, integram, et perfectam ecclesiam ex suis partibus constantem immediate et INDEPENDENTER (quoad alias ecclesias) sub ipso Christo*,—the sect was henceforth called *Independents*, of which the apologist was considered as the founder.

Independents.

The Independents were much more commendable than the Brownists. They surpassed them both in the moderation of their sentiments, and in the order of their discipline. They did not, like Brown, pour forth bitter and uncharitable invectives against the churches which were governed by rules entirely different from theirs, nor pronounce them on that account unworthy of the Christian name. On the contrary, though they considered their own form of ecclesiastical government as of divine institution, and as originally introduced by the authority of the apostles, nay by the apostles themselves; they had yet candour and charity enough to acknowledge, that true religion and solid piety might flourish in those communities which were under the jurisdiction of bishops or the government of synods and presbyteries. This is put beyond all doubt by Robinson himself, who expresses his own private sentiments and those of his community in the following clear and precise words: "*Profitemur coram Deo et hominibus, adeo nobis convenire cum ecclesiis reformatis Belgicis in re religionis, ut omnibus et singulis earundem ecclesiarum fidei articulis, prout habentur in harmonia confessionum fidei, parati sumus subscribere. Ecclesias reformatas pro veris et genuinis habemus, cum iisdem in sacris Dei communionem profitemur, et, quantum in nobis est, colimus.*" They were also much more attentive than the Brownists, in keeping on foot a regular ministry in their communities: for while the latter allowed promiscuously all ranks and orders of men to teach in public, the Independents had, and still have, a certain number of ministers, chosen respectively by the congregations where they are fixed; nor is any person among them permitted to speak in public, before he has submitted to a proper examination of his capacity and talents, and been approved of by the heads of the congregation.

This religious society still subsists, and has produced divines as eminent for learning, piety, and virtue, as any church in Christendom. It is now distinguished from the other Protestant communities chiefly by the two following circumstances.

1. The Independents reject the use of all creeds and confessions drawn up by fallible men, requiring of their teachers no other test of orthodoxy than a declaration of their belief in the gospel of Jesus; and their adherence to the Scriptures as the sole standard of faith and practice.

2. They attribute no virtue whatever to the rite of ordination, upon which some other churches lay so much stress; for the Independents declare, that the qualifications which constitute a regular minister of the New Testament, are, a firm belief in the gospel, a principle of sincere and unaffected piety, a competent stock of knowledge, a capacity for leading devotion and communicating instruction, a serious inclination to engage in the important employment of promoting the everlasting salvation of mankind, and ordinarily an invitation to the pastoral office from some particular society.

3
In what they are now distinguished from other Protestants

society

ciety of Christians. Where these things concur, they consider a person as fitted and authorised for the discharge of every duty which belongs to the ministerial function; and they believe that the imposition of the hands of bishops or presbyters would convey to him no powers or prerogatives of which he was not before possessed.

When the reformers separated from the church of Rome, they drew up public confessions of faith or articles of religion, to which they demanded subscription from their respective followers. Their purpose in this was to guard against dangerous heresies, to ascertain the meaning of Scripture-language, and, we doubt not, to promote the unity of the spirit in the bond of peace. These were laudable ends; but of the means chosen for attaining them, the late Dr Taylor of Norwich, the glory of the Independent churches, and whose learning would have done honour to any church, expresses his opinion in the following indignant language: "How much so ever the Christian world valetueth these creeds and confessions, I confess, for my own part, that I have no opinion of them. But we are told that they were generally drawn up by the ablest divines. But what evidence is there of this? are divines in vogue and power commonly the most knowing and upright? But granting that the reformers were in those days the ablest divines; the ablest divines educated in popish schools, notwithstanding any pretended learning, might comparatively be very weak and defective in scripture knowledge, which was a thing in a manner new to them. In times of great ignorance they might be men of eminence; and yet far short of being qualified to draw up and decide the true and precise rules of faith for all Christians. Yea, their very attempting to draw up, decide, and establish, such rules of faith, is an incontestable evidence of their surprizing ignorance and weakness. How could they be able divines, when they imposed upon the consciences of Christians their own decisions concerning gospel-faith and doctrine? Was not this in fact to teach and constrain Christians to depart from the most fundamental principle of their religion, *subjection and allegiance to Christ, the only teacher and lawgiver?* But if they were able men, were they infallible? No: they publicly affirmed their own fallibility; and yet they acted as if they had been infallible, and could not be mistaken in prescribing faith and doctrine.

"But even if they were infallible, who gave them commission to do what the Spirit of God had done already? Could the first reformers hope to deliver the truths of religion more fully and more clearly than the Spirit of God? Had they found out more apt expressions than had occurred to the Holy Spirit? The Son of God spake not of himself; but as the Father said unto him, so he spake, (John xii. 50.). 'The Spirit of truth spake not of himself; but whatsoever he heard, that he spake,' (John xvi. 13.). 'The things of God the apostles spake, not in the words which man's wisdom teacheth, but which the Holy Ghost teacheth.' (1 Cor. ii. 13.). If the Christian revelation was thus handed down to us from the Fountain of Light with so much care and exactness, both as to matter and words, by the *Son of God*, by the *Spirit*, and by the *apostles*, who were the ancient doctors and bishops? or who were the first reformers? or who were any synods

or assemblies of *divines*, that they *dared* to model Christian faith into their own invented forms, and impose it upon the minds of men in their own devised terms and expressions?

"Hath Christ given authority to all his ministers to the end of the world, to new-mould his doctrines by the rules of human learning whenever they think fit? or hath he delegated his power to any particular persons? Neither the one nor the other. His doctrines are not of such a ductile nature; but stand fixed, both as to matter and words, in the Scripture. And it is at any man's *peril*, who pretends to put them, *as they are rules of faith*, into any new dress or shape. I conclude, therefore, that the first reformers, and all councils, synods, and assemblies, who have met together to collect, determine, and decide, to prescribe and impose matters pertaining to Christian faith, have acted without any warrant from Christ, and therefore have invaded the prerogative of him who is the sole Prophet and Lawgiver to the church. Peace and unity, I know, is the pretended good design of those creeds and confessions. But as God never sanctified them for those ends, so all the world knows they have produced the contrary effects; discord, division, and the spilling of whole seas of Christian blood for 1400 years together."

Such sentiments as these are now maintained by Christians of various denominations; but they were first avowed by the Independents, to whom therefore the merit or demerit of bringing them to light properly belongs. Our readers will think differently of them according to their preconceived opinions; but it is not our province either to confirm or to confute them. They rise almost necessarily out of the independent scheme of congregational churches; and we could not suppress them without deviating from our fixed resolution of doing justice to all religious parties, as well those from whom we differ as those with whom we agree. It ought not, however, to be rashly concluded, that the Independents of the present age, merely because they reject the use of all creeds of human composition, doubt or disbelieve the doctrines deemed orthodox in other churches. Their predecessors in the last century were thought to be more rigid Calvinists than the Presbyterians themselves; as many of those may likewise be who in the present century admit not the confessions and formulas of the Calvinistic churches. They acknowledge as divine truth every doctrine contained in the Scriptures; but they think that scripture-doctrines are most properly expressed in scripture-language; and the same spirit of religious liberty, which makes them reject the authority of bishops and synods in matters of discipline, makes them reject the same authority in matters of faith. In either case, to call any man or body of men their masters, would, in their opinion, be a violation of the divine law, since "one is their master, even Christ, and they are all brethren."

In support of their scheme of congregational churches, they observe, that the word *ἐκκλησία*, which we translate *church*, is always used in Scripture to signify either a *single congregation*, or the *place* where a single congregation meets. Thus that unlawful assembly at Ephesus brought together against Paul by the craftsmen, is called *ἐκκλησία*, a *church*, (Acts xix. 32, 39, 41.). The word, however, is generally applied to a more sacred use;

use; but still it signifies either the *body* assembling, or the *place* in which it assembles. The whole body of the disciples at Corinth is called *the church*, and spoken of as coming together into *one place*, (1 Cor. xiv. 23.) The place into which they came together we find likewise called *a church*; "when ye come together in the church,—when ye come together into one place," (1 Cor. xi. 18, 25.). Wherever there were more congregations than one, there were likewise more *churches* than one: Thus, "Let your women keep silence in the churches," *εν ταις εκκλησιαις*, (1 Cor. xi. 18.). The whole nation of Israel is indeed called *a church*, but it was no more than a single congregation; for it had but one place of public worship, viz. the first tabernacle, and afterwards the temple. The Catholic church of Christ, his holy nation and kingdom, is likewise a single congregation, having one place of worship, viz. *heaven*, where all the members assemble by faith and hold communion; and in which, when they shall all be fully gathered together, they will in fact be one glorious assembly. We find it called "the general assembly and church of the first-born, whose names are written in heaven."

Besides these, the Independent can find no other description of a church in the New Testament; not a trace of a diocese or presbytery consisting of several congregations all subject to one jurisdiction. The number of disciples in Jerusalem was certainly great before they were dispersed by the persecution in which Paul bore so active a part: yet they are never mentioned as forming distinct assemblies, but as *one* assembly meeting with its elders in *one place*; sometimes in the temple, sometimes in Solomon's porch, and sometimes in an upper room. After the dispersion, the disciples who fled from Jerusalem, as they could no longer assemble in one place, are never called a church by themselves, or *one church*, but the *churches* of Judea, Samaria, and Galilee, (Acts ix. 31. Gal. i. 22.) Whence the Independent concludes, that in Jerusalem the words *church* and *congregation* were of the same import; and if such was the case there, where the gospel was first preached, he thinks we may reasonably expect to find it so in other places. Thus when Paul on his journey calls the elders of the church of Ephesus to Miletus, he speaks to them as the joint overseers of a single congregation: "Take heed to yourselves, and to all the flock, over which the Holy Ghost hath made you overseers," (Acts xx. 28.). Had the church at Ephesus consisted of different congregations united under such a jurisdiction as that of a modern presbytery, it would have been natural to say, "Take heed to yourselves, and to the *flocks* over which the Holy Ghost hath made you overseers." but this is a way of speaking of which the Independent finds not an in-

stance in the whole New Testament. The sacred writers, when speaking of all the Christians in a nation or province, never call them *the church* of such a nation or province, but *the churches* of Galatia (Gal. i. 2.), *the churches* of Macedonia (2 Cor. viii. 1.), *the churches* of Asia (1 Cor. xvi. 10.) On the other hand, when speaking of the disciples in a city or town, who might ordinarily assemble in one place, they uniformly call them *a church*; laying, the church of Antioch, the church at Corinth, the church of Ephesus, and the like.

In each of these churches or congregations there were *elders* or *presbyters* and *deacons*: and in every church there seems to have been more than one elder, in some a great many, who all "laboured in word and doctrine." Thus we read (Acts xiv. 23.) of Paul and Barnabas ordaining *elders* in every church; and (Acts xx. 17.) of a *company* of elders in the church of Ephesus, who were exhorted to "feed the flock, and to take heed to themselves and to all the flock over which the Holy Ghost had made them overseers:" but of such elders as are to be found in modern presbyterian churches, who neither teach nor are apt to teach, the Independent finds no vestige in the Scriptures, nor in the earliest uninspired writers of the Christian church. The rule or government of this presbytery or eldership in a church is not their own, but Christ's. They are not lords over God's heritage, nor can they pretend to more power over the disciples than the apostles had. But when the administration of the apostles in the church of Jerusalem, and other churches where they acted as elders, is inquired into by an Independent, it does not appear to him that they did any thing of common concern to the church without the consent of the multitude; nay, it seems they thought it necessary to judge and determine in discipline in presence of the whole church (Acts vi. 1—6. xv. 22. 1 Cor. v. 3, 4, 5.) Excommunication and absolution were in the power of the *church* at Corinth, and not of the elders as distinguished from the congregation (1 Cor. v. 2 Cor. ii.) The apostle indeed speaks of his delivering some unto Satan (1 Tim. i. 20.): but it is by no means clear that he did it by himself, and not after the manner pointed at 1 Cor. v. 4, 5; even as it does not appear, from his saying, in one epistle, that the gift was given unto Timothy by the putting on of *his* hands, that this was not done in the *presbytery* of a church, as in the other epistle we find it actually was. The trying and judging of false apostles was a matter of the first importance: but it was done by the elders with the flock at Ephesus (Rev. ii. 2. Acts xx. 28.); and that whole flock did in the days of Ignatius all partake of the Lord's supper, and pray together in one (B) place. Even the power of binding and loosing, or the power of the *keys*,

(B) The evidence upon which this is said by Mr Glas (for the whole of this reasoning is extracted from his works) is probably the following passage in the epistle of Ignatius to the Ephesians: *Ει γαρ εως και δευτερου προσευχη*, "For if the prayer of one or two be of such force as we are told, how much more prevalent must that be which is made by the bishop and the whole church? He then that does not come together into the *same place* with it, is proud, and hath condemned himself; for it is written, God resisteth the proud. Let us not therefore resist the bishop, that we may be the servants of God." The sentence, as it thus stands by itself, certainly countenances Mr Glas's scheme; but the reader who thinks any regard due to the testimony of Ignatius, will do well to peruse the whole epistle as published by Vossius.

as it has been called, was by our Saviour conferred not upon a particular order of disciples, but upon the church: "If thy brother shall trespass against thee, go and tell him his fault between thee and him alone: if he shall hear thee, thou hast gained thy brother. But if he will not hear thee, then take with thee one or two more, that in the mouth of one or two witnesses every word may be established. And if he shall neglect to hear them, tell it unto the church: but if he neglect to hear the church, let him be unto thee as an heathen man and a publican. Verily I say unto you, whatsoever ye shall bind on earth, shall be bound," &c. (St Mat. xviii. 15, 16, 17, 18.). It is not said, if he shall neglect to hear the one or two, tell it to the elders of the church; far less can it be meant that the offended person should tell the cause of his offence to all the disciples in a presbytery or diocese consisting of many congregations: but he is required to tell it to that particular church or congregation to which they both belong; and the sentence of that assembly, pronounced by its elders, is in a very solemn manner declared to be final, from which there lies no appeal to any jurisdiction on earth.

With respect to the constituting of elders in any church or congregation, the Independent reasons in the following manner: The officers of Christ's appointment are either ordinary and permanent in the church, or they were extraordinary and peculiar to the planting of Christianity. The extraordinary were those who were employed in laying the plan of the gospel churches, and in publishing the New Testament revelation. Such were the apostles, the chosen witnesses of our Saviour's resurrection; such were the prophets inspired by the Holy Ghost for explaining infallibly the Old Testament by the things written in the New; and such were the evangelists, the apostles ministers. These can be succeeded by none in that which was peculiar to them, because their work was completed by themselves. But they are succeeded in all that was not peculiar to them by elders and deacons, the only two ordinary and permanent orders of ministers in the church. We have already seen, that it belongs to the office of the elder to feed the flock of Christ: and the only question to be settled is, how men are ordinarily called to that office? for about the office of the deacon there is little or no dispute. No man now can pretend to be so called of God to the ministry of the word as the apostles and other inspired elders were, whom he chose to be the publishers of his revealed truth, and to whose mission he bore witness in an extraordinary manner. But what the apostles were to those who had the divine oracles from their mouths, that their writings are to us; and therefore as no man can lawfully pretend a call from God to make any addition to those writings, so neither can any man pretend to be lawfully called to the ministry of the word already written but in the manner which that word directs. Now there is nothing of which the New Testament speaks more clearly than of the characters of those who should exercise the office of elders in the church, and of the actual exercise of that office. The former are graphically drawn in the epistles to Timothy and Titus; and the latter is minutely described in Paul's discourse to the Ephesian elders, in Peter's exhortation to elders, and our Lord's commission to those ministers, with whom he promised

to be always present even unto the end of the world. It is not competent for any man or body of men to add to, or diminish from, the description of a gospel minister given in these places, so as to insill upon the necessity of any qualification which is not there mentioned, or to dispense with any qualification as needless which is there required. Neither has Jesus Christ, the only legislator to the church, given to any ministers or people any power or right whatsoever to call, send, elect, or ordain, to that office any person who is not qualified according to the description given in his law; nor has he given any power or right to reject the least of them who are so qualified, and who desire the office of a bishop or elder. Let a man have hands laid upon him by such as could prove an uninterrupted descent by imposition of hands from the apostles; let him be set apart to that office by a company of ministers themselves, the most conformable to the scripture character, and let him be chosen by the most holy people on earth; yet if he answer not the New Testament description of a minister, he is not called of God to that office, and is no minister of Christ, but is indeed running usent. No form of ordination can pretend to such a clear foundation in the New Testament as the description of the persons who should be elders of the church; and the laying on of hands, whether by bishops or presbyters, is of no more importance in the mission of a minister of Christ, than the waving of one's hand in the air or the putting of it into his bosom; for now when the power of miracles has ceased, it is obvious that such a rite, by whomsoever performed, can convey no powers, whether ordinary or extraordinary. Indeed it appears to have been sometimes used, even in the apostolic age, without any such intention. When Paul and Barnabas were separated to the particular employment of going out to the Gentiles, the prophets and teachers at Antioch "prayed and laid their hands on them:" But did this ceremony confer upon the two apostles any new power or authority to act as ministers of Christ? Did the imposition of hands make those shining lights of the gospel one whit better qualified than they were before to convert and baptize the nations, to feed the flock of God, to teach, rebuke, or exhort, with all long-suffering and doctrine. It cannot be pretended. Paul and Barnabas had undoubtedly received the Holy Ghost before they came to Antioch; and as they were apostles, they were of course authorized to discharge all the functions of the inferior and ordinary ministers of the gospel. In a word, whoever in his life and conversation is conformable to the character which the inspired writers give of a bishop or elder, and is likewise qualified by his "mightiness in the scripture" to discharge the duties of that office, is fully authorized to administer the sacraments of baptism and the Lord's supper, to teach, exhort, and rebuke, with all long-suffering and doctrine, and has all the call and mission which the Lord now gives to any man; whilst he who wants the qualifications mentioned, has not God's call, whatever he may have, nor any authority to preach the gospel of Christ, or to dispense the ordinances of his religion.

From this view of the Independent principles, which is faithfully taken from their own writers, it appears, that, according to them, even the election of a congregation

Independents.

Arguments against the efficacy of every kind of ministerial ordination.

and even against the necessity of a popular call.

gation confers upon the man whom they may choose for their pastor no new powers, but only creates a new relation between him and a particular flock, giving him an exclusive right, either by himself or in conjunction with other pastors constituted in the same manner to exercise among them that authority which he derives immediately from Christ, and which in a greater or less degree is possessed by every sincere Christian according to his gifts and abilities. Were the ministers of the gospel constituted in any other way than this; by imposition of hands, for instance, in succession from the apostles; the case of Christians would, in the opinion of the Independents, be extremely hard, and the ways of God scarcely equal. We are strictly commanded not to forsake the assembling of ourselves together, but to continue stedfast in the apostles doctrine and fellowship, and in the breaking of bread, and in prayer: "but can any man (asks one of their advocates) bring himself to believe, that what he is commanded to do in point of gratitude, what is made his own personal act, an act expressive of certain dutiful and pious affections, can possibly be restricted to the intermediate offices or instrumentality of others, who act by powers which he can neither give nor take away? To suppose a thing necessary to my happiness, which is not in my own power, or wholly depends upon the good pleasure of another, over whom I have no authority, and concerning whose intentions and dispositions I can have no security, is to suppose a constitution the most foolish and ill-natured, utterly inconsistent with our ideas of a wise and good agent." Such are some of the principal arguments by which the Independents maintain the divine right of congregational churches, and the inefficacy of ministerial ordination to constitute a minister of Christ. We mean not to remark upon them, as the reader will find different constitutions of the church pleaded for under the words PRESBYTERIANS and EPISCOPACY, to which we refer him for farther satisfaction. We shall only observe at present, what it would be affectation to pass unnoticed, that the mode of reasoning adopted by the last quoted advocate for the Independents, if pushed as far as it will go, necessarily leads to consequences which will not readily be admitted by a Christian of any denomination, or indeed by a serious and consistent Theist.

INDETERMINATE, in general, an appellation given to whatever is not certain, fixed, and limited; in which sense it is the same with *indefinite*.

INDEX, in *Anatomy*, denotes the fore-finger. It is thus called from *indico*, "I point or direct;" because that finger is generally so used: whence also the extensor indicis is called *indicator*.

INDEX, in *Arithmetic* and *Algebra*, shows to what power any quantity is involved, and is otherwise called its *exponent*. See ALGEBRA.

INDEX of a Book, is that part annexed to a book, referring to the particular matter or passages therein contained.

INDEX of a Globe, is a little style fitted on to the north pole, and turning round with it, pointing to certain divisions in the hour-circle. It is sometimes also called *gnomon*. See GLOBE.

Expurgatory INDEX, a catalogue of prohibited books in the church of Rome.

The first catalogues of this kind were made by the inquisitors: and these were afterwards approved of by the council of Trent, after some alteration was made in them by way of retrenchment or addition. Thus an index of heretical books being formed, it was confirmed by a bull of Clement VIII. in 1595, and printed with several introductory rules; by the fourth of which, the use of the Scriptures in the vulgar tongue is forbidden to all persons without a particular licence; and by the tenth rule it is ordained, that no book shall be printed at Rome without the approbation of the Pope's vicar, or some person delegated by the Pope; nor in any other places, unless allowed by the bishop of the diocese, or some person deputed by him, or by the inquisitor of heretical pravity.

The Trent index being thus published, Philip II. of Spain ordered another to be printed at Antwerp, in 1571, with considerable enlargements. Another index was published in Spain 1584; a copy of which was snatched out of the fire when the English plundered Cadiz. Afterwards there were several expurgatory indexes printed at Rome and Naples, and particularly in Spain.

INDIA. See HINDOSTAN.—By the name of *India* the ancients understood only the western peninsula, on this side the Ganges, and the peninsula beyond it, having little or no knowledge of the countries which lie farther to the eastward; though by the moderns all those vast tracts from the eastern parts of the Persian empire to the islands of Japan, are confounded under the general name of *East Indies*. Even the ancients, though originally they were acquainted only with the western parts of Hindostan, gradually extended the name of *India* over the other countries they discovered to the eastward; so that probably they would have involved all the rest in the same general designation, had they been as well acquainted with them as the moderns are. By whom these countries were originally peopled, is a question which in all probability will never be resolved. Certain it is, that some works in these parts discover marks of astonishing skill and power in the inhabitants, such as the images in the island of Elephanta; the rocking stones of immense weight, yet so nicely balanced that a man can move them with his hand; the observatory at Benares, &c. These stupendous works are by Mr Bryant attributed to the Cushites or Babylonians, the first distinct nation in the world, and who of consequence must for some time have possessed in a manner the sovereignty of the whole earth; and it can by no means appear improbable, that the subjects of Nimrod, the beginning of whose kingdom was in Shinar, might extend themselves eastward, and thus fill the fertile regions of the east with inhabitants, without thinking it worth while for a long time to meddle with the less mild and rich countries to the westward. Thus would be formed that great and for some time insuperable division betwixt the inhabitants of India and other countries; so that the western nations knew not even of the existence of the Indians but by obscure report; while the latter, ignorant of their own origin, invented a thousand idle tales concerning the antiquity of their nation, which some of the moderns have been credulous enough to believe and regard as facts.

The first among the western nations who distinguished

ed themselves by their application to navigation and commerce, and who were of consequence likely to discover these distant nations, were the Egyptians and Phœnicians. The former, however, soon lost their inclination for naval affairs, and held all seafaring people in detestation as profane persons; though the extensive conquests of Sesostris, if we can believe them, must have in a great measure supplied this defect. Without regard to the prejudice of his people against maritime affairs, he is said to have fitted out a fleet of 400 sail in the Arabian gulf or Red sea, which conquered all the countries lying along the *Erythrean sea* (A) to India; while the army led by himself marched through Asia, and subdued all the countries to the Ganges; after which he crossed that river, and advanced to the eastern ocean.

Great disputes have been carried on with respect to this conqueror, and the famous expedition just now related; but the learned Dr Robertson, in his *Disquisition concerning ancient India*, declares himself in doubt whether any such expedition ever was made, for the following reasons. 1. Few historical facts seem to be better established than that of the aversion the Egyptians entertained to seafaring people and naval affairs; and the Doctor considers it as impossible even for the most powerful monarch to change in a few years a national habit confirmed by time and sanctified by religion. The very magnitude of the armaments is an argument against their existence; for besides the 400 ships of war, he had another fleet in the Mediterranean; and such a mighty navy could not have been constructed in any nation unaccustomed to maritime affairs, in a few years. 2. Herodotus makes no mention of the conquests of India by Sesostris, though he relates his history at some length. Our author is of opinion that the story was fabricated betwixt the time of Herodotus and that of Diodorus Siculus, from whom we have the first account of this expedition. Diodorus himself informs us that he had it from the Egyptian priests; and gives it as his opinion, that "many things they related flowed rather from a desire to promote the honour of their country than from attention to truth;" and he takes notice that both the Egyptian priests and Greek writers differ widely from one another in the accounts which they give of the actions of Sesostris. 3. Though Diodorus declares that he has selected the most probable parts of the Egyptian narrative, yet there are still so many improbabilities, or rather impossibilities, contained in his relation, that we cannot by any means give credit to it. 4. For the reason just mentioned, the judicious geographer Strabo rejected the account altogether, and ranks the exploits of Sesostris in India with the fabulous ones of Bacchus and Hercules.

But whatever may be determined with regard to the Egyptians, it is certain that the Tyrians kept up a constant intercourse with some parts of India by navigating the Arabian gulf, now the Red sea. Of this navigation they became masters by taking from the

Indians some maritime places on the coast of the Red sea: but as the distance betwixt the nearest place of that sea and Tyre was still considerable, the land-carriage would have been very tedious and expensive; for which reason it was necessary to become masters of a port on the eastern part of the Mediterranean, nearer to the Red sea than Tyre, that so the goods might be shipped from thence to Tyre itself. With this view they took possession of Rhinvelura, the nearest port on the Mediterranean to the Arabian gulf; and to that port all the goods from India were conveyed by a much shorter and less expensive route than over land.—This is the first authentic account of any intercourse betwixt India and the western part of the world; and to this we are without doubt in a great measure to ascribe the vast wealth and power for which the city of Tyre was anciently renowned; for in other respects the whole territory of Phœnicia was but of little consequence. Notwithstanding the frequency of these voyages, however, the ancients are able to give little or no account of them. The most particular description we have of the wealth, power, and commerce of ancient Tyre, is in the prophecies of Ezekiel; so that if the Tyrians themselves kept any journals of their voyages, it is probable that they were entirely lost when the city was destroyed by Alexander the Great.

Though the Jews, under the reign of David and Solomon, carried on an extensive and lucrative commerce, yet our author is of opinion that they did not trade to any part of India. There are only two places mentioned to which their ships sailed, viz. Ophir and Tarshish; both of which are now supposed to have been situated on the eastern coast of Africa: the ancient Tarshish, according to Mr Bruce, was the present Mocha; and Ophir the kingdom of Sofala, so remarkable in former times for its mines, that it was called by Oriental writers the *golden Sofala* *.

Thus the Indians continued for a long time unknown to the western nations, and undisturbed by them; probably in subjection to the mighty empire of Babylon, from which the country was originally peopled, or in alliance with it; and the possession of this vast region will easily account for the immense and otherwise almost incredible wealth and power of the ancient Babylonish monarchs. Soon after the destruction of that monarchy by the Persians, however, we find their monarch Darius Hytaspes undertaking an expedition against the Indians *. His conquests were not extensive, as they did not reach beyond the territory watered by the Indus; nevertheless, such as they were, the acquisition seems to have been very important, as the revenue derived from the conquered territory, according to Herodotus, was near a third of that of the whole Persian empire. According to his account, however, we must form a much more diminutive opinion of the riches of the Persian monarch than has commonly been done; since Herodotus tells us, that the empire was divided into 20 satrapies or governments; all of which yielded

(A) This must not be confounded with the *Red sea*, notwithstanding the similarity of names. The *Erythrean sea* is that part of the ocean which is interposed betwixt the straits of Babelmandel and the Malabar coast, now called the *Indian sea* or ocean.

India. yielded a revenue of 14,560 Euboic talents, amounting in the whole to 2,807,437l. sterling. The amount of the revenue from the conquered provinces of India therefore must have been considerably short of a million. Very little knowledge of the country was diffused by the expedition of Darius, or the voyage of Scylax whom he employed to explore the coast; for the Greeks paid no regard to the transactions of those whom they called *Barbarians*; and as for Scylax himself, he told so many incredible stories in the account he gave of his voyage, that he had the misfortune to be disbelieved in almost every thing, whether true or false.

3
Of Alexander the Great.

The expedition of Alexander is so fully taken notice of under the article HINDOSTAN, that nothing more remains to be said upon it in this place, than that he went no farther into the country than the present territory of the Panjab, all of which he did not traverse. Its south-west boundary is formed by a river anciently called the *Hysudrus*, now the *Setlege*. The breadth of the district from Ludhana on the Setlege, to Attock on the Indus, is computed to be 259 geographical miles in a straight line; and Alexander's march, computed in the same manner, did not exceed 200; nevertheless, by the spreading of his numerous army over the country, and the exact measurement and delineation of all his movements by men of science whom he employed, a very extensive knowledge of the western part of India was obtained. It is, however, surprising, that having marched through so many countries in the neighbourhood of India, where the people must have been well acquainted with the nature of the climate, the Macedonian conqueror did not receive any information concerning the difficulties he would meet with from the rains which fell periodically at a certain season of the year. It was the extreme distress occasioned by them which made his soldiers finally resolve to proceed no farther; and no wonder indeed that they did adopt this resolution, since Diodorus informs us, that it had rained incessantly for 70 days before their departure. These rains, however, according to the testimony both of ancient and modern writers, fall only in the mountainous parts, little or none being ever seen in the plains. Aristobulus informs us, that in the country through which Alexander marched, though heavy rains fell among the mountains, not a shower was seen in the plains below. The district is now seldom visited by Europeans; but Major Rennel was informed by a person of credit, who had resided in the Panjab, that during great part of the S. W. monsoon, or at least in the months July, August, and part of September, which is the rainy season in most other parts of India, very little rain falls in the Delta of the Indies, except very near the sea, though the atmosphere is generally clouded, and very few showers fall throughout the whole season. Captain Hamilton relates, that when he visited Tatta, no rain had fallen there for three years before. We may have some idea of what the Macedonians suffered by what happened afterwards to Nadir Shah, who, though possessed of vast wealth and power, as well as great experience in military affairs, yet lost a great part of his army in crossing the mountains and rivers of the Panjab, and in battles with the savage inhabitants who inhabit the countries betwixt the Oxus and the frontiers of Persia. He marched

through the same countries, and nearly in the same direction, that Alexander did. India.

By his voyage down the river Indus, Alexander contributed much more to enlarge our geographical knowledge of India than by all his marches and conquests by land. According to Major Rennel, the space of country through which he sailed on the Indus, from the Hyphasis to the ocean, was not less than 1000 miles; and as, during the whole of that navigation, he obliged the nations on both sides the river to submit to him, we may be very certain that the country on each side was explored to some distance. An exact account not only of his military operations, but of every thing worthy of notice relating to the countries through which he passed, was preserved in the journals of his three officers, Lagus, Nearchus and Aristobulus; and these journals, Arrian informs us, he followed in the composition of his history. From these authors we learn, that in the time of Alexander, the western part of that vast tract named *India* was possessed by seven very powerful monarchs. The territory of King Porus, which Alexander first conquered, and then restored to him, is said to have contained no fewer than 2000 towns; and the king of the Prasii had assembled an army of 20,000 cavalry, 2000 armed chariots, and a great number of elephants, to oppose the Macedonian monarch on the banks of the Ganges. The navigable rivers with which the Panjab country abounds, afforded then, and still continue to afford, an intercourse from one part to another by water: and as at that time these rivers had probably many ships on them for the purposes of commerce, Alexander might easily collect all the number he is said to have had, viz. 2000; since it is reported that Semiramis was opposed by double the number on the Indus when she invaded India. When Mahmud Gazni also invaded this country, a fleet was collected upon the Indus to oppose him, consisting of the same number of vessels. From the Ayeen Akbery, also, we learn that the inhabitants of this part of India still continue to carry on all their communication with each other by water; and the inhabitants of the circar of Tatta alone have 40,000 vessels of various constructions.

Under the article HINDOSTAN we have mentioned Why Alexander's historians take no notice of Scylax. Major Rennel's opinion concerning the silence of Alexander's historians about the expedition of Scylax; but Dr Robertson accounts for it in another manner. "It is remarkable (says he), that neither Nearchus, nor Ptolemy, nor Aristobulus, nor even Arrian, once mention the voyage of Scylax. This could not proceed from their being unacquainted with it, for Herodotus was a favourite author in the hands of every Greek who had any pretensions to literature. It was probably occasioned by the reasons they had to distrust the veracity of Scylax, of which I have already taken notice. Accordingly, in a speech which Arrian puts in the mouth of Alexander, he asserts, that, except Bacchus, he was the first who had passed the Indus; which implies that he disbelieved what is related concerning Scylax, and was not acquainted with what Darius Hytaspes is said to have done in order to subject that part of India to the Persian crown. This opinion is confirmed by Megasthenes, who resided a considerable time in India. He asserts that, except Bacchus and Hercules (to whose fabulous expeditions Strabo is astonished

9
State of India in the time of Alexander.

10
Why Alexander's historians take no notice of Scylax.

astonished that he should have given any credit), Alexander was the first who had invaded India. Arrian informs us that the Assaceni, and other people who inhabited the country now called *Candahar*, had been tributary first to the Assyrians and then to the Medes and Persians. As all the fertile provinces on the north-west of the Indus were anciently reckoned to be part of India, it is probable that what was levied from them is the sum mentioned in the tribute-roll from which Herodotus drew his account of the annual revenue of the Persian empire, and that none of the provinces to the south of the Indus were ever subject to the kings of Persia."—The Doctor differs from Mr Rennel with respect to the surprise which Alexander and his army expressed when they saw the high tides at the mouth of the Indus. This he thinks might very naturally have been the case, notwithstanding what Herodotus had written concerning the flux and reflux observable in the Red sea. All that has been mentioned by Herodotus concerning this phenomenon is, that "in the Red sea there is a regular ebb and flow of the tide every day." No wonder therefore that the Macedonians should be surprised and terrified at the very high tides which presented themselves in the Indian ocean, which the few words of Herodotus above-mentioned had by no means led them to expect. In the like manner the Romans were surprised at the tides in the Atlantic, when they had conquered some of the countries bordering upon that ocean. Cæsar describes the astonishment of his soldiers at a spring tide in Britain which greatly damaged his fleet; and indeed, considering the very little rise of the tide in the Mediterranean, to which alone the Greeks and Romans had access, we may reckon the account given us by Arrian highly probable.

The country on each side the Indus was found, in the time of Alexander, to be in no degree inferior in population to the kingdom of Porus already mentioned. The climate, soil, and productions of India, as well as the manners and customs of the inhabitants, are exactly described, and the descriptions found to correspond in a surprising manner with modern accounts. The stated change of seasons now known by the name of *monsoons*, the periodical rains, the swellings and inundations of the rivers, with the appearance of the country during the time they continue, are particularly described. The descriptions of the inhabitants are equally particular; their living entirely upon vegetable food, their division into tribes or casts, with many of the particularities related under the article HINDOO, are to be met with in the accounts of Alexander's expedition. His military operations, however, extended but a very little way into India properly so called; no farther indeed than the modern province of Lahor, and the countries on the banks of the Indus from Moulton to the sea; though, had he lived to undertake another expedition as he intended, it is very probable that he would have subdued a vastly greater tract of country; nor indeed could anything probably have set bounds to his conquests but death or revolts in distant provinces of his empire. In order to secure the obedience of those countries he subdued, Alexander found it necessary to build a number of fortified cities; and the farther eastward he extended his conquests, the more necessary did he find this task. Three he built in India itself; two

on the banks of the Hydaspes, and a third on the Acesines, both navigable rivers, falling into the Indus after they have united their streams. By means of these cities he intended not only to keep the adjacent countries in awe, but to promote a commercial intercourse betwixt different parts both by land and water. With this view also, on his return to Susa, he surveyed in person the course of the Euphrates and Tigris, causing the cataracts or dams to be removed which the Persian monarchs had built to obstruct the navigation of these rivers, in conformity to a maxim of their superstition, that it was unlawful to defile any of the elements, which they imagined was done by navigators. After the navigation was opened in this manner, he proposed that the valuable commodities of India should be imported into the other parts of his dominions by means of the Persian gulf; while through the Red sea they were conveyed to Alexandria in Egypt, and thence dispersed all over Europe.

The death of Alexander having put an end to all his great schemes, the eastern part of his dominions devolved first on Pytho the son of Agenor, and afterwards on Seleucus. The latter was very sensible of the advantages to be derived from keeping India in subjection. With this view he undertook an expedition into that country, partly to establish his authority more perfectly, and partly to defend the Macedonian territories against Sandracottus king of the Prasii, who threatened to attack them. The particulars of his expedition are very little known; Justin being the only author that mentions them, and his authority is but of little weight, unless corroborated by the testimony of other historians. Plutarch, who tells us that Seleucus carried his arms farther into India than Alexander, is subject to an imputation of the same kind; but Pliny, whose authority is of considerably greater weight, corroborates the testimony of Plutarch in this instance, though his words are so obscure, that learned men differ in opinion concerning their meaning. Bayer thinks they imply that Seleucus marched from the Hyphasis, the boundary of Alexander's conquests, to the Hyfudrus, from thence to Palibothra, and then to the mouth of the Ganges; the distances of the principal stations being marked, and amounting in all to 2244 Roman miles. Notwithstanding this authority, however, Dr Robertson thinks it very improbable that the expedition of Seleucus should have continued so long, as in that case "the ancients would have had a more accurate knowledge of that part of the country than they seem ever to have possessed."

The career of Seleucus in the east was stopped by Antigonus, who prepared to invade the western part of his dominions. The former was therefore obliged to conclude a treaty with Sandracottus, whom he allowed to remain in quiet possession of his territories; but Dr Robertson is of opinion, that during the lifetime of Seleucus, which continued 42 years after the death of Alexander, no diminution of the Macedonian territories took place. With a view of keeping up a friendly intercourse with the Indian prince, Seleucus sent Megasthenes, one of Alexander's officers, to Palibothra, capital of the kingdom of the Prasii, situated on the banks of the Ganges. This city is by Dr Robertson supposed to be the modern Allahabad, seated at the conflux of the Jumna and Ganges, con-

13
Conjectures
concerning
the situa-
tion of Pa-
libothra.

India. trary to the opinion of Major Rennel, who supposes it to be Patna. * As Megasthenes resided in this city for a considerable space of time, he had an opportunity of making many observations on the country of India in general; and these observations he was induced afterwards to publish. Unhappily, however, he mingled with his relations the most extravagant fables. To him may be traced the ridiculous accounts of men with ears so large that they could wrap themselves up in them; of tribes with one eye, without mouths or noses, &c. whence the extracts from his book given by Arrian, Diodorus, and other ancient writers, can scarcely be credited, unless confirmed by other evidence.

14 Expedition of Antiochus the Great into India. After the embassy of Megasthenes to Sandracottus, and that of his son Damaichus to Allitrechidas, the successor of Sandracottus, we hear no more of the affairs of India with regard to the Macedonians, until the time of Antiochus the Great, who made a short incursion into India about 197 years after the death of Seleucus. All that we know of this expedition is, that the Syrian monarch, after finishing a war he carried on against the two revolted provinces of Parthia and Bactria, entered India, where he obliged Sophagenus, king of the country which he invaded, to pay a sum of money, and give him a number of elephants. It is probable that the successors of Seleucus were obliged soon after his death to abandon all their Indian territories.

15 Account of the Grecian kingdom of Bactria. After the loss of India by the Syrians, an intercourse was kept up for some time betwixt it and the Greek kingdom of Bactria. This last became an independent state about 69 years after the death of Alexander; and, according to the few hints we have concerning it in ancient authors, carried on a great traffic with India. Nay, the Bactrian monarchs are said to have conquered more extensive tracts in that region than Alexander himself had done. Six princes reigned over this new kingdom in succession; some of whom, elated with the conquests they had made and the power they had acquired, assumed the title of *Great King*, by which the Persian monarchs were distinguished in their highest splendour. Strabo informs us, that the Bactrian princes were deprived of their territories by the Scythian Nomades, who came from the country beyond the Jaxartes, and were known by the names of Asi, Pasi, Tachari, and Scarauli. This is confirmed by the testimony of some Chinese historians quoted by M. de Guignes. According to them, about 126 years before the Christian era, a powerful horde of Tartars, pushed from their native seats on the confines of China, and obliged to move farther to the west, passed the Jaxartes, and, pouring in upon Bactria like an irresistible torrent, overwhelmed that kingdom, and put an end to the dominion of the Greeks after it had lasted near 130 years.

16 Intercourse betwixt Egypt and India. From this time to the close of the 15th century, all thoughts of establishing any dominion in India were totally abandoned by the Europeans. The only object now was to promote a commercial intercourse with that country: and Egypt was the medium by which that intercourse was to be promoted. Ptolemy the son of Lagus, and first king of Egypt, first raised the power and splendour of Alexandria, which he knew had been built by Alexander with a view to carry on a trade to India: and in order to make the navigation

more secure, he built the celebrated light-house at Pharos; a work so magnificent as to be reckoned one of the wonders of the world. His son Ptolemy Philadelphus prosecuted the same plan very vigorously. In his time the Indian commerce once more began to centre in Tyre; but to remove it effectually from thence, he formed a canal between Arsinoe on the Red sea, not far from the place where Suez now stands, and the Pelusiac or eastern branch of the Nile. This canal was 100 cubits broad and 30 deep; so that by means of it the productions of India might have been conveyed to Alexandria entirely by water. We know not whether this work was ever finished, or whether it was found useless on account of the dangerous navigation towards the northern extremity of the Red sea; but whatever was the cause, it is certain that no use was made of it, and a new city named Berenice, situated almost under the tropic, upon the western shore of the Red sea, became the staple of Indian commerce. From thence the goods were transported by land to Coptos, a city distant only three miles from the Nile, to which it was joined by a navigable canal. Thus, however, there was a very tedious land carriage of no less than 258 Roman miles through the barren desert of Thebais: but Ptolemy caused diligent search to be made everywhere for springs, and wherever these were found, he built inns or caravanseras for the accommodation of travellers; and thus the commerce with India was carried on till Egypt became subject to the Romans. The ships during this period set sail from Berenice, and coasting along the Arabian shore to the promontory of Syagrus, now Cape Rasalgate, held their course along the coast of Persia till they arrived at the mouth of the western branch of the river Indus. They either failed up this branch till they came to Pattala, now Tatta, situated at the upper part of the Delta, or continued their course to some other emporium on the western part of the Indian coast. A more convenient course was afterwards found by sailing directly to Zizenis, a place concerning which there is now some dispute. Montequieu will have it to be the kingdom of Sigertis, on the coast adjacent to the Indus, and which was conquered by the Bactrian monarchs; but Major Rennel is of opinion that it was a port on the Malabar coast. Dr Robertson does not pretend to decide this dispute; but is of opinion, that during the time of the Ptolemies very little progress was made in the discovery of India. He contests the opinion of Major Rennel, that "under the Ptolemies the Egyptians extended their navigation to the extreme point of the Indian continent, and even sailed up the Ganges to Palibothra, now Patna." In this case he thinks that the interior parts of India must have been much better known to the ancients than we have any reason to believe they were. He owns indeed that Strabo mentions the sailing up the Ganges, but then it is only cursorily and in a single sentence; "whereas if such a considerable inland voyage of above 400 miles, through a populous and rich country, had been customary, or even if it had been ever performed by the Roman, Greek, or Egyptian traders, it must have merited a particular description, and must have been mentioned by Pliny, and other writers, as there was nothing similar to it in the practice of navigation among the ancients."—The extreme danger of navigating

India.

gating the Red sea in ancient times (which even in the present improved state of navigation is not entirely got over) seems to have been the principal reason which induced Ptolemy to remove the communication with India from Arsinoe to Berenice, as there were other harbours on the same coast considerably nearer to the Nile. After the ruin of Coptos by the emperor Dioclesian, the Indian commodities were conveyed from the Red sea to the Nile from Cossair, supposed by Dr Robertson to be the *Philoterus Portus* of Ptolemy, to Cous, the *Vicus Apollinus*, a journey of four days. Hence Cous from a small village became an opulent city; but in process of time, the trade from India removed from Cous to Kenè, farther down the river. In modern times such Indian goods as are brought by the Red sea come from Gidda to Suez, and are carried across the isthmus on camels, or brought by the caravan returning from the pilgrimage to Mecca.

It was to this monopoly of Indian commerce that Egypt owed its vast wealth and power during the time of its Macedonian monarchs; but it appears surprising that no attempt was made by the Syrian monarchs to rival them in it, especially as the latter were in possession of the Persian gulf, from whence they might have imported the Indian commodities by a much shorter navigation than could be done by the Egyptians. For this neglect several reasons are assigned by our learned author. 1. The Egyptians, under their Greek monarchs, applied themselves to maritime affairs; and were in possession of such a powerful fleet as gave them a decided superiority at sea. 2. No intercourse by sea was ever kept up betwixt Persia and India, on account of the aversion which the Persians had to maritime affairs. All the Indian commodities were then conveyed in the most tedious and difficult manner over land, and dispersed throughout the various provinces, partly by means of navigable rivers and partly by means of the Caspian sea. 3. Many of the ancients, by an unaccountable error in geography, imagined the Caspian sea to be a part of the great northern ocean; and thus the kings of Syria might hope to convey the Indian commodities to the European countries without attempting to navigate those seas which the Egyptian monarchs deemed their own property. Seleucus Nicator, the first and greatest of the Syro-Macedonian monarchs, formed a project of joining the Euxine and Caspian seas by a navigable canal, which would have effectually answered the purpose, but was assassinated before he could put it in execution, and none of his successors had abilities to execute such an undertaking.— Alexander the Great had given orders, a little before his death, to fit out a squadron on the Caspian sea, in order to discover whether it had any communication with the northern ocean, the Euxine sea, or Indian ocean; but Dr Robertson justly thinks it surprising that such errors concerning this sea should have existed among the ancients, as Herodotus had long before described it properly in the following words: "The Caspian is a sea by itself, unconnected with any other. Its length is as much as a vessel with oars can sail in 15 days; and its greatest breadth as much as it can sail in eight days." Aristotle describes it in like manner, and insists that it ought to be called a great lake, and not a sea.

On the conquest of Egypt by the Romans, the Indian commodities continued as usual to be imported to Alexandria in Egypt, and from thence to Rome; but besides this, the most ancient communication betwixt the eastern and western parts of Asia seems never to have been entirely given up. Syria and Palestine are separated from Mesopotamia by a desert; but the passage through it was much facilitated by its affording a station which abounded in water. Hence the possession of this station became an object of such consequence, that Solomon built upon it the city called in Syria *Tadmor*, and in Greek *Palmyra*. Both these names are expressive of its situation in a spot adorned with palmyres. Though its situation for trade may to us seem very unfavourable (being 60 miles from the Euphrates, by which alone it could receive the Indian commodities, and 203 from the nearest coast of the Mediterranean), yet the value and small bulk of the goods in question rendered the conveyance of them by a long carriage over land not only practicable but lucrative and advantageous. Hence the inhabitants became opulent and powerful, and long maintained its independence even after the Syrian empire became subject to Rome. After the reduction of Palmyra by the emperor Aurelian, however, it did not any more recover its splendor; the trade gradually turned into other channels, and the city was reduced to ruins, which still exist, and manifest its former grandeur. See PALMYRA.

The excessive eagerness of the Romans for Asiatic luxuries of all kinds kept up an unceasing intercourse with India during the whole time that the empire continued in its power; and even after the destruction of the western part, it was kept up betwixt Constantinople and those parts of India which had been visited formerly by merchants from the western empire. Long before this period, however, a much better method of sailing to India had been discovered by one Hippalus the commander of an Indian ship, who lived about 80 years after Egypt had been annexed to the Roman empire. This man having observed the periodical shifting of the monsoons, and how steadily they blew from the east or west during some months, ventured to leave the coast, and sail boldly across the Indian ocean from the mouth of the Arabian gulf to Musiris, a port on the Malabar coast; which discovery was reckoned a matter of such importance, that the name of Hippalus was given to the wind by which he performed the voyage. Pliny gives a very particular account of the manner in which the Indian traffic was now carried on, mentioning the particular stages, and the distances between them, which are as follow. From Alexandria to Juliopolis was two miles; and there the cargo destined for India was shipped on the Nile, and carried to Coptos, distant 303 miles, the voyage being usually performed in twelve days. From Coptos they were conveyed by land to Berenice, distant 258 miles, and halting at different stations as occasion required. The journey was finished on the 12th day; but by reason of the heat the caravan travelled only in the night. The ships left Berenice about midsummer, and in 30 days reached Ocelis, now *Gella*, at the mouth of the Arabian gulf, or Cane (now *Cape Fartaque*) on the coast of Arabia Felix; from whence they sailed in 40 days to Musiris already mentioned. Their homeward voyage began early in the month of December; when setting sail with

New route to India discovered by Hippalus.

India.

with a north-east wind, and meeting with a south or south-west one when they entered the Arabian gulf, the voyage was completed in less than a year. With regard to the situation of Musiris, as well as of Barace, another Indian port to which the ancients traded, Major Rennel is of opinion, and Dr Robertson agrees with him, that they stood somewhere between Goa and Tellicherry; and that probably the modern Meerzaw or Merjec is the Musiris, and Barcelore the Barace of the ancients.

20
Ptolemy's
account of
India.

Ptolemy, who flourished about 200 years after the commencement of the Christian era, having the advantage of so many previous discoveries, gives a more particular description of India than what is to be met with in any of the ancient writers; notwithstanding which, his accounts are frequently inconsistent not only with modern discoveries, but with those of more ancient geographers than himself. A most capital error in his geography is, that he makes the peninsula of India stretch from the Sinus Barygzenus, or gulf of Cambay, from west to east, instead of extending, according to its real direction, from north to south; and this error must appear the more extraordinary, when we consider that Megasthenes had published a measurement of this peninsula nearly consonant to truth, which had been adopted with some variations by Eratosthenes, Strabo, Diodorus Siculus, and Pliny. His information concerning the situation of places, however, was much more accurate. With respect to some districts on the eastern part of the peninsula, as far as the Ganges, he comes nearer the truth than in his descriptions of any of the rest. These are particularly pointed out by M. d'Anville, who has determined the modern names of many of Ptolemy's stations, as Kilkare, Negapatam, the mouth of the river Cauveri, Masulipatam, &c. The river Cauveri is the *Chabaris* of Ptolemy; the kingdom of Arcot, *Arcati Regio*; and probably, says Dr Robertson, the whole coast has received its present name of Coromandel from *Sor Mandulam*, or the kingdom of Sore, which is situated upon it. Ptolemy had likewise acquired so much knowledge concerning the river Ganges, that he describes six of its mouths, though his delineation of that part of India which lies beyond the Ganges is hardly less erroneous than that of the nearer peninsula. M. d'Anville, however, has been at great pains to elucidate those matters, and to illustrate those parts of the writings of Ptolemy which appear to be best founded. According to him, the golden Chersonesus of Ptolemy is the peninsula of Malacca; he supposes the gulf of Siam to be the great bay of Ptolemy, and the *Sinæ Metropolis* of the same writer he looks upon to be Sin-hoa in the western part of the kingdom of Cochin-China, though Ptolemy has erred in its situation no less than 50 degrees of longitude and 20 of latitude. M. Gosselin, however, differs from his countryman M. d'Anville, in a late work intitled "The Geography of the Greeks analysed; or the systems of Eratosthenes, Strabo, and Ptolemy, compared with each other, and with the knowledge which the moderns have acquired." In the opinion of M. Gosselin, the Magnam Promontorium of Ptolemy is not Cape Romania at the southern extremity of the peninsula of Malacca, as M. d'Anville supposes, but the point Bragu, at the mouth of the river Ava. The great bay of Ptolemy he supposes not to be the gulf of Siam, but of Martaban.

India.

He endeavours to prove that the position of Cattipnara, as laid down by Ptolemy, corresponds with that of Mergui, a sea port on the west of Siam; and that *Thina*, or *Sinæ Metropolis*, is not Sin-hoa, but Tana-serim, a city on the same river with Mergui; and he contends, that the Ibbadii insula of Ptolemy is not Sumatra, as D'Anville would have it, but one of the small isles which lie in a cluster off this coast. M. Gosselin is of opinion that the ancients never sailed through the straits of Malacca, nor had any knowledge of the island of Sumatra, or of the eastern ocean.

The errors of Ptolemy have given occasion to a mistake of more modern date, viz. that the ancients were acquainted with China. This arose from the resemblance betwixt the name of that empire and the *Sinæ* of the ancients. The Ayeen Akbery informs us, that *Cheen* was an ancient name of Pegu; whence, says Dr Robertson, "as that country borders upon Ava, where M. Gosselin places the great promontory, this near resemblance of names may appear perhaps to confirm his opinion that *Sinæ Metropolis* was situated on this coast, and not so far east as M. d'Anville has placed it."

Thus we see that the peninsula of Malacca was in all probability the boundary of the ancient discoveries by sea; but by land they had correspondence with countries still farther distant. While the Seleucidæ continued to enjoy the empire of Syria, the trade with India continued to be carried on by land in the way already mentioned. The Romans having extended their dominions as far as the river Euphrates, found this method of conveyance still established, and the trade was by them encouraged and protected. The progress of the caravans being frequently interrupted by the Parthians, particularly when they travelled towards those countries where silk and other of the most valuable manufactures were procured, it thence became an object to the Romans to conciliate the friendship of the sovereigns of those distant countries. That such an attempt was actually made, we know from the Chinese historians, who tell us, that *Antoun*, by whom they mean the emperor Marcus Antoninus, the king of the people of the western ocean, sent an embassy to Ounti, who reigned in China in the 166th year of the Christian era; but though the fact is mentioned, we are left entirely in the dark as to the issue of the negotiations. It is certain, however, that during the times of the Romans such a trade was carried on; and as we cannot suppose all those who visited that distant region to be entirely destitute of science, we may reasonably enough conclude, that by means of some of these adventurers, Ptolemy was enabled to determine the situation of many places which he has laid down in his geography, and which correspond very nearly with the observations of modern times.

With regard to the Indian islands, considering the little way they extended their navigation, they could not be acquainted with many of them. The principal one was that of Ceylon, called by the ancients *Taprobane*. The name was entirely unknown in Europe before the time of Alexander the Great; but that conqueror, though he did not visit, had some how or other heard of it; with regard to any particulars, however, he seems to have been very slenderly informed; and the accounts of ancient geographers concerning it are confused

cients.

confused and contradictory. Strabu says, it is as large as Britain, and situated at the distance of seven days according to some reports, or 20 days sailing according to others, from the southern extremity of the peninsula. Pomponius Mela is uncertain whether to consider Taprobane as an island, or the beginning of another world; but inclines to the latter opinion, as nobody had ever sailed round it. The account of Pliny is still more obscure; and by his description he would make us believe, that it was seated in the southern hemisphere beyond the tropic of Capricorn. Ptolemy places it opposite to Cape Comorin, at no great distance from the continent; but errs greatly with regard to its magnitude, making it no less than 15 degrees in length from north to south. And Agathemarus, who wrote after Ptolemy, makes Taprobane the largest island in the world, assigning the second place to Britain. From these discordant accounts, some learned men have supposed that the Taprobane of the ancients is not Ceylon, as is generally believed, but the island of Sumatra; though the description of it by Ptolemy, with the figure delineated in his maps, seems to put it beyond a doubt, that Ceylon, and not Sumatra, is the island to which Ptolemy applies the designation of Taprobane. The other islands described by that geographer to the eastward of Taprobane, are, according to Dr Robertson, those called *Andaman* and *Nicobar* in the gulf of Bengal.

From the time of Ptolemy to that of the emperor Justinian, we have no account of any intercourse of the Europeans with India, or of any progress made in the geographical knowledge of the country. Under that emperor one Cosmas, an Egyptian merchant, made some voyages to India, whence he acquired the surname of *Indicopleustes*. Having afterwards turned monk, he published several works; one of which, named *Christian Topography*, has reached us. In this, though mixed with many strange reveries, he relates with great simplicity and appearance of truth what he had seen in his travels or had learned from others. He describes several places on the western coast of the hither peninsula, which he calls the chief seat of the pepper-trade; and from one of the ports on that coast named *Male*, Dr Robertson thinks that the name *Malabar* may probably be derived, as well as that of *Maldives* given to a cluster of islands lying at no great distance. Cosmas informs us also, that in his time the island of Taprobane had become a great staple of trade. He supposed it to lie about half way betwixt the Persian gulf and the country of the Sinae; in consequence of which commodious situation it received the silk of the Sinae, and the precious spices of the remote regions of the east, which were from thence conveyed to all parts of India, Persia, and the Arabian gulf. He calls it not *Taprobane*, but *Sioldibia*, derived from *Selendib*, or *Serendib*, the same by which it is still known all over the east. From him also we learn, that the Persians having overthrown the empire of the Parthians, applied themselves with great diligence and success to maritime affairs; in consequence of which they became formidable rivals to the Romans in the India trade. The latter finding themselves thus in danger of losing entirely that lucrative branch, partly by reason of the rivalry just mentioned, and partly by reason of the frequent hostilities which took place between the two empires,

formed a scheme of preserving some share of the trade by means of his ally the emperor of Abyssinia. In this he was disappointed, though afterwards he obtained his end in a way entirely unexpected. This was by means of two monks who had been employed as missionaries in different parts of the east, and had penetrated as far as the country of the Seres or China. From thence, induced by the liberal promises of Justinian, they brought a quantity of the eggs of the silk-worms in a hollow cane. They were then hatched by the heat of a dunghill; and being fed with the leaves of the mulberry, worked and multiplied as well as in those countries of which they are natives. Vast numbers were soon reared in Greece; from whence they were exported to Sicily, and from thence to Italy; in all which countries silk manufactures have since been established.

On the conquest of Egypt by the Saracens in the year 640, the India trade was of course transferred to them; and they soon began to pursue it with much more vigour than the Romans had done. The city of Bassora was built by the caliph Omar upon the western banks of the great river formed by the union of the Euphrates with the Tigris. Thus the command of both rivers was secured, and the new city soon became a place of such consequence as scarce to yield to Alexandria itself. Here Dr Robertson takes notice, that from the evidence of an Arabian merchant who wrote in the year 851, it appears, that not only the Saracens, but the Chinese also, were destitute of the mariners compass; contrary to the general opinion, that this instrument was known in the east long before it made its appearance in Europe. From this relation, as well as much concurring evidence, says our author, "it is manifest, that not only the Arabians but the Chinese were destitute of this faithful guide, and that their mode of navigation was not more adventurous than that of the Greeks and Romans. They steered ferively along the coast, seldom stratching out to sea so far as to lose sight of land; and as they shaped their course in this timid manner, their mode of reckoning was defective, and liable to the same errors with that of the Greeks and Romans." Notwithstanding this disadvantage, however, they penetrated far beyond Siam, which had set bounds to the navigation of the Europeans. They became acquainted with Sumatra and other Indian islands; extending their navigation as far as the city of Canton in China. A regular commerce was now carried on from the Persian gulf to all the countries lying betwixt it and China, and even with China itself. Many Saracens settled in India properly so called, and in the countries beyond it. In the city of Canton particularly, they were so numerous, that the emperor permitted them to have a cadí or judge of their own religion; the Arabian language was understood and spoken in every place of consequence; and ships from China are even said to have visited the Persian gulf.

According to the Arabian accounts of those days, the peninsula of India was at that time divided into four kingdoms. The first was composed of the provinces situated on the Indus and its branches, the capital of which was Moultan. The second had the city of Canoge, which, from the ruins of it remaining at this day, appears to have been a very large place. The

Ind. a.

Indian historians relate, that it contained 30,000 shops in which betel nut was sold, and 60,000 sets of musicians and singers who paid a tax to government. The third kingdom was that of Cachimere, first mentioned by Maslouti, who gives a short description of it. The fourth kingdom, Guzerat, is represented by the same author as the most powerful of the whole. Another Arab writer, who flourished about the middle of the 14th century, divides India into three parts; the northern, comprehending all the provinces on the Indus; the middle, extending from Guzerat to the Ganges; and the southern, which he denominates Comar, from Cape Comorin.

From the relation of the Arabian merchant above mentioned, explained by the commentary of another Arabian who had likewise visited the eastern parts of Asia, we learn many particulars concerning the inhabitants of these distant regions at that time, which correspond with what is observed among them at this day. They take notice of the general use of silk among the Chinese; and the manufacture of porcelain, which they compare to glass. They also describe the tea plant, with the manner of using its leaves; whence it appears, that in the ninth century the use of this plant in China was as common as it is at present. They mention likewise the great progress which the Indians had made in astronomy; a circumstance which seems to have been unknown to the Greeks and Romans: they assert, that in this branch of science the Indians were far superior to the most enlightened nations of the west, on which account their sovereign was called the "King of wisdom." The superstitions, extravagant penances, &c. known to exist at this day among the Indians, are also mentioned by those writers; all which particulars manifest that the Arabians had a knowledge of India far superior to that of the Greeks or Romans. The zeal and industry of the Mohammedans in exploring the most distant regions of the east was rivalled by the Christians of Persia, who sent missionaries all over India and the countries adjoining, as far as China itself. But while the western Asiatics thus kept up a constant intercourse with these parts, the Europeans had in a manner lost all knowledge of them. The port of Alexandria, from which they had formerly been supplied with the Indian goods, was now shut against them; and the Arabs, satisfied with supplying the demands of their own subjects, neglected to send any by the usual channels to the towns on the Mediterranean. The inhabitants of Constantinople and some other great towns were supplied with Chinese commodities by the most tedious and difficult passage imaginable. The silk of that country was purchased in the most westerly province named Chenfi; from whence it was conveyed by a caravan, which marched 80 or 100 days, to the banks of the Oxus. Here it was embarked, and carried down the river to the Caspian sea; whence, after a dangerous voyage across that sea, it was carried up the river Cyrtus as far as that river is navigable; after which it was conducted by a land carriage of five days to the river Phasis, then down that stream into the Euxine, and thence to Constantinople. The passage of goods from Hindostan was less tedious; they being carried either directly to the Caspian or to the river Oxus, but by a passage much shorter than that

from China; after which they were conveyed down the Phasis to the Euxine, and thus to Constantinople.

It is evident that a commerce thus carried on must have been liable to a thousand disadvantages. The goods conveyed over such vast tracts of land could not be sold but at a very high price, even supposing the journey had been attended with no danger; but as the caravans were continually exposed to the assaults of barbarians, it is evident that the price must on that account have been greatly enhanced. In spite of every difficulty, however, even this commerce flourished, and Constantinople became a considerable mart for East Indian commodities; and from it all the rest of Europe was chiefly supplied with them for more than two centuries. The perpetual course of hostilities in which the Christians and Mohammedans were during this period engaged, contributed still to increase the difficulty: and it is remarkable, that the more this difficulty increased, the more desirous the Europeans seemed to be of possessing the luxuries of Asia.

About this time the cities of Amalphi and Venice, with some others in Italy, having acquired a greater degree of independence than they formerly possessed, began first to exert themselves in promoting domestic manufactures, and then to import the productions of India in much larger quantities than formerly. Some traces of this revival of a commercial spirit, according to Dr Robertson, may be observed from the end of the seventh century. The circumstances which led to this revival, however, are entirely unnoticed by historians; but during the seventh and eighth centuries, it is very probable that no commercial intercourse whatever took place betwixt Italy and Alexandria; for, prior to the period we speak of, all the public deeds of the Italian and other cities of Europe had been written upon paper made of the Egyptian papyrus, but after that upon parchment.

The mutual antipathy which the Christians and Mohammedans bore against each other, would no doubt for a long time retard the progress of commerce between them; but at last the caliphs, perceiving the advantage which such a traffic would be of to their subjects, were induced to allow it, while the eagerness with which the Christians coveted the Indian products and manufactures, prompted them to carry it on. But scarce was the traffic begun, when it seemed in danger of being totally interrupted by the crusades. Notwithstanding the enthusiastic zeal of these adventurers, however, there were many to whom commerce was a greater object than religion. This had always been the case with numbers of the pilgrims who visited the holy places at Jerusalem even before the commencement of the crusades: but these, after they took place, instead of retarding the progress of this kind of commerce, proved the means of promoting it to a great degree. "Various circumstances (says Dr Robertson) concurred towards this. Great armies, conducted by the most illustrious nobles of Europe, and composed of men of the most enterprising spirit in all the kingdoms of it, marched towards Palestine, through countries far advanced beyond those which they left in every species of improvement. They beheld the dawn of prosperity in the republics of Italy, which had begun to vie with each other in the arts of industry, and in their efforts to engross the lucrative commerce with

India. the east. They next admired the more advanced state of opulence and splendor in Constantinople, raised to a pre-eminence above all cities then known by its extensive trade, particularly that which it carried on with India and the countries beyond it. They afterwards served in those provinces of Asia through which the commodities of the east were usually conveyed, and became masters of several cities which had been staples of that trade. They established the kingdom of Jerusalem, which subsisted near 200 years. They took possession of the throne of the Greek empire, and governed it about half a century. Amidst such a variety of events and operations, the ideas of the fierce warriors of Europe gradually opened and improved; they became acquainted with the policy and arts of the people whom they subdued: they observed the sources of their wealth, and availed themselves of all this knowledge. Antioch and Tyre, when conquered by the crusaders, were flourishing cities, inhabited by opulent merchants, who supplied all the nations trading in the Mediterranean with the productions of the east; and, as far as can be gathered from incidental occurrences mentioned by the historians of the holy war, who being mostly priests and monks, had their attention directed to objects very different from those relating to commerce, there is reason to believe, that both in Constantinople while subject to the Franks, and in the ports of Syria acquired by the Christians, the long-established trade with the east continued to be protected and encouraged."

Our author next goes on to show in what manner the commerce of the Italian states was promoted by the crusades, until at last, having entirely engrossed the East India trade, they strove with such eagerness to find new markets for their commodities, that they extended a taste for them to many parts of Europe where they had formerly been little known. The rivalry of the Italian states terminated at last in a treaty with the sultan of Egypt in 1425, by which the port of Alexandria and others in Egypt were opened to the Florentines as well as the Venetians; and soon after, that people began to obtain a share in the trade to India.

30
How the
India
trade was
carried on
in the 14th
century.

The following account of the manner in which the India trade was carried on in the beginning of the 14th century, is given by Marino Sanudo a Venetian nobleman. The merchants of that republic were supplied with the commodities they wanted in two different ways. Those of small bulk and great value, such as cloves, nutmegs, gems, pearls, &c. were carried up the Persian gulf to Bassora, from thence to Bagdad, and afterwards to some port on the Mediterranean. The more bulky goods, such as pepper, cinnamon, and other spices, were brought in the usual manner to the Red sea, and from thence to Alexandria. The goods brought by land, however, were always liable to be seized by barbarians; and therefore the supply that way was scanty, and the price extravagantly dear, while, on the other hand, the sultan of Egypt, by imposing duties upon the East India cargoes to the amount of a full third of the value, seemed to render it impossible that the owners should find purchasers for their goods. This, however, was far from being the case; the demand for India goods continually increased; and thus a communication, formerly unknown, betwixt all the

nations of Europe, was begun and kept up. All this time, however, there had been no direct communication betwixt Europe and India, as the Mohammedans would never allow any Christian to pass through their dominions into that country. The dreadful incursions and conquests of the Tartars under Jenghiz-khan, however, had so broken the power of the Mohammedans in the northern parts of Asia, that a way was now opened to India through the dominions of these barbarians. About the middle of the 13th century, therefore, Marco Polo, a Venetian, by getting access to the khan of the Tartars, explored many parts of the east which had long been unknown even by name to the Europeans. He travelled through China from Peking on its northern frontier to some of its most southerly provinces. He visited also different parts of Hindostan, and first mentions Bengal and Guzerat by their modern names as great and flourishing kingdoms. He obtained also some account of an island which he called *Zipangri*, and was probably no other than Japan; he visited Java with several of the islands in its neighbourhood, the island of Ceylon, and the coast of Malabar as far as the gulf of Cambay; to all which he gave the names they have at this day. The discovery of such immense regions unknown before in Europe, furnished vast room for speculation and conjecture; and while the public attention was yet engaged by these discoveries, the destruction of Constantinople by the Turks gave a very considerable turn to the East India commerce, by throwing it almost entirely into the hands of the Venetians. Hitherto the Genoese had rivalled that state in the commerce we speak of, and they had possessed themselves of many important places on the coast of Greece, as well as of the port of Cassa on the Black sea. Nay, they had even established themselves at Constantinople, in the suburb of Pera, in such a manner as almost entirely to exclude the Greeks themselves from any share in this commerce; but by the destruction of Constantinople they were at once driven out of all these possessions, and so thoroughly humbled, that they could no longer contend with the Venetians as before; so that, during the latter part of the 15th century, that republic supplied the greater part of Europe with the productions of the east, and carried on trade to an extent far beyond what had been known in former times. The mode in which they now carried on this trade was somewhat different from what had been practised by ancient nations. The Tyrians, Greeks, and Romans, had sailed directly to India in quest of the commodities they wanted; and their example has been imitated by the navigators of modern Europe. In both periods the Indian commodities have been paid for in gold and silver; and great complaints have been made on account of the drain of those precious metals, which were thus buried as it were in India, never to return again. The Venetians, however, were exempted from this loss; for having no direct intercourse with India, they supplied themselves from the warehouses they found in Egypt and Syria, ready filled with the precious commodities they wanted; and these they purchased more frequently by barter than with ready money. Thus, not only the republic of Venice, but all the cities which had the good fortune to become emporia for the India goods imported by it, were raised to such a pitch of

India.

power and splendor as scarce ever belonged to any European state. The citizens of Bruges, from which place the other European nations were for a long time supplied with these goods, displayed such magnificence in their dress, buildings, and manner of living, as excited even the envy of their queen Joan of Navarre who came to pay them a visit. On the removal of the staple from Bruges to Antwerp, the latter soon displayed the same opulence; and in some cities of Germany, particularly Augsburg, the great mart for Indian commodities in the internal parts of that country, there are examples of merchants acquiring such large fortunes as entitled them to high rank and consideration in the empire. The most accurate method, however, of attaining some knowledge of the profits the Venetians had on their trade, is by considering the rate of interest on money borrowed at that time. This, from the close of the 11th century to the commencement of the 16th, we are told, was no less than 20 per cent. and sometimes more. Even as late as 1500, it was 10 or 12 in every part of Europe. Hence we are to conclude that the profits of such money as was then applied in trade must have been extremely high; and the condition of the inhabitants of Venice at that time warrants us to make the conclusion. "In the magnificence of their houses (says Dr Robertson), in richness of furniture, in profusion of plate, and in every thing which contributed either towards elegance or parade in their mode of living, the nobles of Venice surpassed the state of the greatest monarch beyond the Alps. Nor was all this display the effect of an ostentatious and inconsiderate dissipation; it was the natural consequence of successful industry, which, having accumulated wealth with ease, is entitled to enjoy it in splendor."

34
High interest of money in the 15th century.

This excessive superiority of wealth displayed by the Venetians could not fail to excite the envy of the other states of Europe. They were at no loss to discover that the East India trade was the principal source from whence their wealth was derived. Some of them endeavoured to obtain a share by applying to the sultans of Egypt and Syria to gain admission into their ports upon the same terms with the Venetians; but either by the superior interest of the latter with those princes, or from the advantages they had of being long established in the trade, the Venetians always prevailed. So intent indeed were the other European powers on obtaining some share of this lucrative commerce, that application was made to the sovereign of Russia to open an intercourse by land with China, though the capitals of the two empires are upwards of 6000 miles distant from each other. This, however, was beyond the power of the Russian prince at that time; and the Venetians imagined that their power and wealth were fully established on the most permanent basis, when two events, altogether unforeseen and unexpected, gave it a mortal blow, from which it never has recovered, nor can recover itself. These were the discovery of America and that of the passage to the East Indies by the Cape of Good Hope. The former put Spain in possession of immense treasures; which being gradually diffused all over Europe, soon called forth the industry of other nations, and made them exert themselves in such a manner as of itself must have soon lessened the demand for Indian productions.

35
The Venetian trade ruined by the discovery of the Cape of Good Hope.

The discovery of the passage to India by the Cape of Good Hope, however, was the most effectual and speedy in humbling the Venetians. After a tedious course of voyages along the western coast of Africa, continued for near half a century, Vasco de Gama, an active and enterprising Portuguese officer, doubled the Cape of Good Hope, and, coasting along the eastern shore of the continent, sailed next across the Indian ocean, and landed at Calicut on the coast of Malabar, on the 22d of May 1498, ten months and two days after leaving the port of Lisbon. On his arrival in India he was at first received with great kindness by the sovereign of that country, styled the *Samarin*; but afterwards, from what causes we cannot now well determine, the Indian prince suddenly changed his kindness into mortal enmity, and attempted to cut off Gama with his whole party. The Portuguese admiral, however, found means to escape every plot that was laid against him; and loaded his ships not only with the products of that part of the country, but with many of the valuable products of the more remote regions.

On his return to Portugal, De Gama was received with all imaginable demonstrations of kindness. The Portuguese nation, nay all the nations in Europe, the Venetians alone excepted, rejoiced at the discovery which had been made. The latter beheld in it the certain and unavoidable downfall of their own power, while the Portuguese, presuming upon their right of prior discovery, which they took care to have confirmed by a papal grant, plumed themselves on the thoughts of having the whole Indian commerce centre in their nation. The expectations of the one, and the apprehensions of the other, seemed at first to be well-founded. A succession of gallant officers sent into the east from Portugal accomplished the greatest and most arduous undertakings. In 24 years after the voyage of De Gama, they had made themselves masters of many important places in India; and among the rest of the city of Malacca, where the great staple of trade throughout the whole East Indies was established. As this city stands nearly at an equal distance from the eastern and western extremities of all the countries comprehended under the name of *Indies*, it was frequented by the merchants of China, Japan, of all the kingdoms on the continent, the Moluccas and other islands in that quarter, as well as by those of Malabar, Ceylon, Coromandel, and Bengal. Thus the Portuguese acquired a most extensive influence over the internal commerce of India; while, by the settlements they had formed at Goa and Diu, they were enabled to engross the trade on the Malabar coast, and greatly to obstruct the long established intercourse of Egypt with India by the way of the Red sea. Their ships now frequented every port in the east where any valuable commodities were to be had, from the Cape of Good Hope to the river of Canton in China; and all along this immense extent of more than 4000 leagues, they had a chain of forts and factories established for the convenience of protecting their trade. They had likewise made themselves masters of several stations favourable to commerce along the southern coast of Africa, and in many islands lying between Madagascar and the Moluccas. In all places where they came, their arms had struck such terror, that they not only carried on their trade without any rival or controul, but even prescribed

India.

36
Exploits of the Portuguese in India.

India. to the natives the terms of their mutual intercourse; nay, sometimes they set what price they pleased upon the commodities they purchased, and thus were enabled to import into Europe the Indian commodities in greater abundance and at a lower rate than had ever been done before. Not satisfied with this, they formed a scheme of excluding all other nations from any share of the trade they enjoyed; and for that purpose determined to make themselves masters of such stations on the Red sea and Persian gulf as might put them in possession of the navigation of both these seas, and enable them not only to obstruct the ancient commerce between Egypt and India, but to command the mouths of the great rivers which we have formerly mentioned as the means of conveying the Indian goods through the internal parts of Asia. The conduct of these enterprises was committed to Alphonso Albuquerque, the most distinguished officer at that time in the Portuguese service. By reason of the vast number of the enemies he had to contend with, however, and the scanty supplies which could be derived from Portugal, he could not fully accomplish what was expected from him. However, he took from the petty princes who were tributaries to the kings of Persia the small island of Ormus, which commanded the mouth of the Persian gulf; and thus secured to Portugal the possession of that extensive trade with the east which the Persians had carried on for several centuries. On this barren island, almost entirely covered with salt, and so hot that the climate can scarcely be borne, destitute of a drop of fresh water, except what was brought from the continent, a city was erected by the Portuguese, which soon became one of the chief seats of opulence, splendour, and luxury, in the eastern world. In the Red sea the Arabian princes made a much more formidable resistance; and this, together with the damage his fleet sustained in that sea, the navigation of which is always difficult and dangerous, obliged Albuquerque to retire without effecting any thing of importance. Thus the ancient channel of conveyance still remained open to the Egyptians; but their commerce was greatly circumscribed and obstructed by the powerful interest of the Portuguese in every port to which they had been accustomed to resort.

37
 Intellectual
 rugges of
 the Vene-
 ans to re-
 lieve their
 Affairs.

The Venetians now began to feel those effects of De Gama's discovery which they had dreaded from the beginning. To preserve the remains of their commerce, they applied to the sultan of the Mameluks in Egypt, who was no less alarmed than themselves at the loss of such a capital branch of his revenue as he had been accustomed to derive from the India trade. By them this fierce and barbarous prince was easily persuaded to send a furious manifesto to Pope Julius II. and Emmanuel king of Portugal. In this, after stating his exclusive right to the Indian trade, he informed them, that if the Portuguese did not relinquish that new course of navigation by which they had penetrated into the Indian ocean, and cease from encroaching on that commerce which from time immemorial had been carried on between the east of Asia and his dominions, he would put to death all the Christians in Egypt, Syria, and Palestine, and demolish the holy sepulchre itself. To this threat, which some centuries before would have alarmed all Christendom, no regard was paid; so that the Venetians, as their last re-

source, were obliged to have recourse to a different expedient. This was to excite the sultan to fit out a fleet in the Red sea to attack the Portuguese, and drive them from all their settlements in the east; nay, in order to assist him in the enterprise, he was allowed to cut down their forests in Dalmatia, to supply the deficiency of Egypt in timber for ship-building. The timber was conveyed from Dalmatia to Alexandria; and from thence, partly by water and partly by land, to Suez; where twelve men of war were built, on board which a body of Mameluks were ordered to serve under the command of an experienced officer. Thus the Portuguese were assaulted by a new enemy, far more formidable than any they had yet encountered; yet such was the valour and conduct of the admiral, that after several severe engagements, the fleet of the infidels was entirely ruined, and the Portuguese became absolute masters of the Indian ocean.

This disaster was followed in no long time by the total overthrow of the dominion of the Mameluks in Egypt by Selim the Turkish sultan; who thus also became master of Syria and Palestine. As his interest was now the same with that of the Venetians, a league was quickly formed betwixt them for the ruin of the power of the Portuguese in India. With this view Selim confirmed to the Venetians the extensive commercial privileges they enjoyed under the government of the Mameluks; publishing at the same time an edict, by which he permitted the free entry of all the productions of the east imported directly from Alexandria into any part of his dominions, but imposed heavy taxes upon such as were imported from Lisbon. All this, however, was insufficient to counteract the great advantages which the Portuguese had obtained by the new passage to India, and the settlements they had established in that country; at the same time that the power of the Venetians being entirely broken by the league of Cambray, they were no longer able to contribute any assistance. They were therefore reduced to the necessity of making an offer to the king of Portugal to purchase all the spices imported into Lisbon, over and above what might be requisite for the consumption of his own subjects. This offer being rejected, the Portuguese for some time remained uncontrolled masters of the Indian trade, and all Europe was supplied by them, excepting some very inconsiderable quantity which was imported by the Venetians through the usual channels.

38
 Why the
 Portuguese
 trade was
 not inter-
 rupted by
 other Eu-
 ropean
 powers.

The Portuguese continued to enjoy this valuable branch of commerce undisturbed almost for a whole century; to which, however, they are indebted more to the political situation of the different European nations than to their own prowess. After the accession of Charles V. to the throne of Spain, that kingdom was either so much engaged in a multiplicity of operations, owing to the ambition of that monarch and his son Philip II. or so intent on prosecuting the discoveries and conquests in the new world, that no effort was made to interfere with the East Indian trade of the Portuguese, even though an opportunity offered by the discovery of a second passage by sea to the East Indies through the straits of Magellan. By the acquisition of the crown of Portugal in 1580, Spain, instead of becoming the rival, became the protector and guardian of the Portuguese trade. The resources of France all

India. this time were so much exhausted by a continuance of long and desolating wars, that it could bestow neither much attention on objects at such a distance, nor engage in any expensive scheme. England was desolated by the ruinous wars between the houses of York and Lancaster, and afterwards its enterprising spirit was restrained by the cautious and covetous Henry VII. His son Henry VIII. in the former part of his reign, by engaging in the continental quarrels of the European princes, and in the latter part by his quarrel with the pope and contests about religion, left no time for commercial schemes. It was not therefore till the reign of Queen Elizabeth that any attention was paid to the affairs of the east by that kingdom. The first who took the power of the Portuguese in India were the Dutch; and in this they were gladly seconded by the natives, whom the Portuguese had most grievously oppressed. The English soon followed their example; and in a few years the Portuguese were expelled from their most valuable settlements, while the most lucrative branches of their trade have continued ever since in the hands of those two nations.

40
English set-
tlements in
India.

It is not to be supposed that the other European nations would sit still and quietly see these two engross the whole of this lucrative commerce without attempting to put in for a share. East India companies were therefore set up in different countries: but it was only between France and Britain that the great rivalry commenced; nor did this fully display itself till after the peace of Aix-la-Chapelle. Both nations had by this time made themselves masters of considerable settlements in India. The principal of those belonging to Britain were, 1. Surat, situated on the western side of the peninsula within the Ganges, between the 21st and 22d degrees of N. Lat. This peninsula comprehended the kingdoms of Malabar, Decan, Golconda, and Bijnagar, with the principalities of Gingi, Tanjour, and Madura; the western coast being distinguished by the name of Malabar, and the eastern by that of Coromandel. 2. Bombay, a small island in the kingdom of Decan, about 45 leagues to the south of Surat. 3. Dabul, about 40 leagues farther to the south, in the province of Cuncan. 4. Carwar, in N. Lat. 15°, where there was a small fort and factory. 5. Tillicherry, to which place the English trade was removed from Calicut, a large town 15 leagues to the southward. 6. Anjengo, between eight and nine degrees of latitude, the most southerly settlement on the western coast of the peninsula. 7. On the Coromandel coast they possessed Fort St David's, formerly called Tegapatan, situated in the kingdom of Gingi, in 11° 40' N. Lat. 8. Madras, the principal settlement on this coast, between 13° and 14° N. Lat. not far from the diamond mines of Golconda. 9. Visigapatam, farther to the north. 10. Balasore, in latitude 22°, a factory of small consequence. 11. Calcutta, the capital of all the British settlements in the East Indies. These were the principal places belonging to Britain which we shall have occasion to mention in the account of the contests which now took place; those of the French were chiefly Pondicherry and Chandernagore.

47
Origin of
the East In-
dian war
betwixt the
French and
English in
1747.

The war is said to have been first occasioned by the intrigues of the French commandant M. Dupleix; who immediately after the peace of Aix-la-Chapelle, began

to sow dissension among the nabobs, who had by this time usurped the sovereignty of the country. Nizam Almuluck, viceroy of Decan, and nabob of Arcot, had, as officer for the Mogul, nominated Anaverdy Khan to be governor of the Carnatic, in the year 1745. On the death of Nizam, his second son Nazir-zing was appointed to succeed him in his viceroyalty, and his nomination was confirmed by the Mogul. He was opposed by his cousin Muzapher-zing, who applied to Dupleix for assistance. By him he was supplied with a body of Europeans and some artillery; after which, being also joined by Chunda Saib, an active Indian prince, he took the field against Nazir-zing. The latter was supported by a body of British troops under Colonel Laurence; and the French, dreading the event of an engagement, retired in the night; so that their ally was obliged to throw himself on the clemency of Nazir-zing. His life was spared, though he himself was detained as a state prisoner; but the traitor, forgetting the kindness showed him on this occasion, entered into a conspiracy against the life of Nazir-zing, and murdered him in his camp; in which infamous transaction he was encouraged by Dupleix and Chunda Saib, who had retired to Pondicherry. Immense riches were found in the tents of Nazir-zing, great part of which fell to the share of Dupleix, whom Muzapher-zing now associated with himself in the government. By virtue of this association, the Frenchman assumed the state and formalities of an eastern prince; and he and his colleague Muzapher-zing appointed Chunda Saib nabob of Arcot. In 1749, Anaverdy Khan had been defeated and killed by Muzapher-zing and Chunda Saib, assisted by the French; after which his son Mohammed Ali Khan had put himself under the protection of the English at Madras, and was confirmed by Nazir-zing as his father's successor in the nabobship or government of Arcot. This government therefore was disputed betwixt Mohammed Ali Khan, appointed by the legal viceroy Nazir-zing, and supported by the English company, and Chunda Saib nominated by the usurper Muzapher-zing, and protected by Dupleix, who commanded at Pondicherry. Muzapher-zing, however, did not long enjoy his ill-got authority; for in the year 1751, the nabobs who had been the means of raising him to the power he enjoyed, thinking themselves ill rewarded for their services, fell upon him suddenly, defeated his forces, and put him to death; proclaiming Salabat-zing next day viceroy of the Decan. On the other hand, the Mogul appointed Gauzedy Khan, the elder brother of Salabat-zing, who was confirmed by Mohammed Ali Khan in the government of Arcot: but the affairs of the Mogul were at that time in such disorder, that he could not with an army support the nomination he had made. Chunda Saib in the mean time determined to recover by force the nabobship of Arcot, from which he had been deposed by the Mogul, who had placed Anaverdy Khan in his room. With this view he had recourse to Dupleix at Pondicherry, who reinforced him with 2000 Sepoys, 60 Caffrees, and 420 French; upon condition that if he succeeded, he should cede to the French the town of Velur in the neighbourhood of Pondicherry, with its dependencies, consisting of 45 villages. Thus reinforced, he defeated Anaverdy Khan who lost his life in the engagement, reassumed the government of Arcot,

India.

India. cot, and punctually performed the engagements he had come under to his French allies.

All this time Mohammed Ali Khan had been supported by the English, to whom he fled after his father's death. By them he was supplied with a reinforcement of men, money, and ammunition, under the conduct of Major Laurence, a brave and experienced officer. By means of this supply he gained some advantages over the enemy; and repairing afterwards to Fort St David's, he obtained a further reinforcement. With all this assistance, however, he accomplished nothing of any moment; and the English auxiliaries having retired, he was defeated by his enemies. Thus he was obliged to enter into a more close alliance with the English, and cede to them some commercial points which had been long in dispute; after which, Captain Cope was despatched to put Trinchinopoli in a state of defence, while Captain de Gingis, a Swiss officer, marched at the head of 400 Europeans to the assistance of the nabob. On this occasion Mr Clive first offered his service in a military capacity. He had been employed before as a writer, but appeared very little qualified for that or any other department in civil life. He now marched towards Arcot at the head of 210 Europeans and 500 Sepoys. In the first expedition he displayed at once the qualities of a great commander. His movements were conducted with such secrecy and despatch, that he made himself master of the enemy's capital before they knew of his march; and gained the affections of the people by his generosity, in affording protection without ransom. In a short time, however, he found himself invested in Fort St David's by Rajah Saib, son to Chunda Saib, an Indian chief, pretender to the nabobship of Arcot, at the head of a numerous army; the operations of the siege being conducted by European engineers. Thus, in spite of his utmost efforts, two practicable breaches were made, and a general assault given; but Mr Clive having got intelligence of the intended attack, defended himself with such vigour, that the assailants were everywhere repulsed with loss, and obliged to raise the siege with the greatest precipitation. Not contented with this advantage, Mr Clive, being reinforced by a detachment from Trinchinopoli, marched in quest of the enemy; and having overtaken them in the plains of Arani, attacked and entirely defeated them on the 3d of December 1751.

This victory was followed by the surrender of the forts of Timery, Conjaveram, and Arani: after which Mr Clive returned in triumph to Fort St David's. In the beginning of the year 1752 he marched towards Madras, where he was reinforced by a small body of troops from Bengal. Though the whole did not exceed 300 Europeans with as many natives as were sufficient to give the appearance of an army, he boldly proceeded to a place called *Koveripauk*, about 15 miles from Arcot, where the enemy lay to the number of 1500 Sepoys, 1700 horse, with 150 Europeans, and eight pieces of cannon. Victory was long doubtful, until Mr Clive having sent round a detachment to fill upon the rear of the enemy while the English attacked the entrenchments in front with their bayonets, a general confusion ensued, the enemy were routed with considerable slaughter, and only saved from total destruction by the darkness of the night. The French

to a man threw down their arms, and surrendered themselves prisoners of war; all the baggage and cannon falling at the same time into the hands of the victors.

On the return of Mr Clive to Fort St David's, he was superseded in the command by Major Laurence. By him he was detached with 400 Europeans, a few Mahratta foldiers, and a body of Sepoys, to cut off the enemy's retreat to Pondicherry. In this enterprise he was attended with his usual good success, took several forts, vanquished the French commander M. d'Anteuil, and obliged him with all his party to surrender prisoners of war.

Chunda Saib, in the mean time, lay encamped with an army of 30,000 men at Syringham, an island in the neighbourhood of Trinchinopoli; but Major Laurence having found means to intercept his provisions, he was obliged to fly. Being obliged to pass through the camp of the Tanjore general, he obtained a pass for the purpose; but was nevertheless detained by the nabob; who was an ally of the English, and his head was struck off, in order to prevent any disputes that might arise concerning him.

After the flight of Chunda Saib, his army was attacked and routed by Major Laurence; and the island of Syringham surrendered, with about 1000 French soldiers under the command of Mr Law, brother to him who schemed the Mississippi company. M. Dupleix, exceedingly mortified at this bad success, proclaimed Rajah Saib, son to Chunda Saib, nabob of Arcot; and afterwards produced forged commissions from the Great Mogul, appointing him governor of all the Carnatic from the river Krittinah to the sea. The better to carry on this deception, a messenger pretended to come from Delhi, and was received with all the pomp of an ambassador from the Great Mogul. Dupleix, mounted on an elephant, and preceded by music and dancing women, after the oriental fashion, received his commission from the hands of this impostor; after which he affected the state of an eastern prince, kept his *darbar* or court, appeared sitting cross-legged on a sofa, and received presents as sovereign of the country, from his own council as well as from the natives.

Thus the forces of the English and French East India companies were engaged in a course of hostilities at a time when no war existed between the two nations; and while they thus continued to make war upon each other under the title of auxiliaries to the contending parties, Gauzedy Khan took possession of the dignity appointed him by the Mogul; but had not been in possession of it above 14 days when he was poisoned by his own sister. His son Seah Aadin Khan was appointed to succeed him by the Mogul; but the latter being unable to give him proper assistance, Salabat-zing remained without any rival, and made a present to the French commander of all the English possessions to the northward.

Thus concluded the campaign of 1752. Next year both parties received considerable reinforcements; the English, by the arrival of Admiral Watson with a squadron of ships of war, having on board a regiment commanded by Colonel Aldercon; and the French by M. Gadeheu, commissary and governor-general of all their settlements, on whose arrival M. Dupleix departed

two na-
tions con-
cluded.

parted for Europe. The new governor made the most friendly proposals; and desired a cessation of arms until the disputes could be adjusted in Europe. These proposals being readily listened to on the part of the English, deputies were sent to Pondicherry, and a provisional treaty and truce were concluded, on condition that neither of the two companies should for the future interfere in any of the differences that might take place in the country. The other articles related to the places or settlements that should be retained or possessed by the respective companies, until fresh orders should arrive from the courts of London and Versailles; and till then it was stipulated, that neither of the two nations should be allowed to procure any new grant or cession, or to build forts in defence of any new establishment; nor should they proceed to any cession, retrocession, or evacuation, of what they then possessed; but every thing should remain on the same footing as formerly.

The treaty was published on the 11th of January 1755; at the end of which month Admiral Watson returned with his Squadron from Bombay, and M. Godeheu returned to France in the beginning of February, leaving M. Leyrit his successor at Pondicherry. M. Buffy, with the Soubahdar Salabat-zing, commanded in the north; and M. de Saussay was left to command the troops at Syringham. Matters, however, did not long continue in a state of tranquillity. Early in the year it appeared that the French were endeavouring to get possession of all the provinces of the Deccan. M. Buffy demanded the fortrefs of Golconda from Salabat-zing; and M. Leyrit encouraged the piousder or governor who rented Velu to take up arms against the nabob. He even sent 300 French and as many Sepoys from Pondicherry to support this rebel, and oppose the English employed by the nabob to collect his revenues from the tributary princes. In this office they had been employed ever since the cessation of hostilities; one half of the revenue being paid to the nabob, and the other to the company, which now involved them in a kind of military expedition into the country of the Polygars, who had been previously summoned to send agents to settle accounts with the nabob. Four of them obeyed the summons; but one *Lachenaig* refused, and it was therefore resolved to attack him. The country was very strong, being almost entirely fortified by nature or art; for it was surrounded by craggy hills detached from one another, and covered with bushes so as to be impassable for any but the natives, who had thrown up works from hill to hill. These works were indeed very rude, being formed of large stones laid upon one another without any cement, and flanked at proper distances by round earthen towers; before the wall was a deep and broad ditch, with a large hedge of bamboos in front, so thick that it could not be penetrated but by the hatchet or by the fire. This was forced, though not without some loss; after which another work of the same kind, but stronger, made its appearance; but this being likewise forced, Lachenaig was obliged to submit and pay his tribute.

The English army now marched to Madura, a strong Indian town about 60 miles south of Trinchinopoli. On their approach it submitted without any opposition, and the inhabitants seemed pleased with their change

of government. Here a deputation was received from a neighbouring Polygar, desiring an alliance, and as a proof of his sincerity making an offer of two settlements on the sea-coast of his country opposite to the island of Ceylon, which would greatly facilitate their future commerce with Tinivelly. Before this time they could not have reached that city but by a circuitous march of 400 or 500 miles; but from the new settlements the distance to Tinivelly was no more than 50 miles, and reinforcements or supplies of any kind might be sent them from Madras or Fort St David in four or five days. This offer being accepted, Colonel Heron, the English commander, marched to attack the governor of Madura, who had fled to a place called *Coilgoody*: on the approach of the English he fled from this place also, leaving the greatest part of his troops to defend the place. The road was so rugged, that the carriages of the cannon broke down; and as the troops were not furnished with scaling ladders, there seemed to be little hope of gaining the place, which was very strong. The colonel, however, determined to make an assault after the Indian manner, by burning down the gates with bundles of straw; and to encourage his men in this new method of attack, he himself carried the first torch, being followed by Mohammed Iffouf, who bore the second. The place was taken and plundered, not sparing even the temples; which inspired the inhabitants with the utmost abhorrence of the victors on account of their contempt of their religion.

After this exploit the army removed to Madura; and a garrison being left in the place, they proceeded to Tinivelly, which submitted without opposition, and owned the jurisdiction of the nabob; though some of the Polygars still evaded payment, and therefore hostilities were commenced against them.

The new expedition was marked by an act of the most disgraceful cruelty at a fort named *Nellecotah*, 40 miles south of Tinivelly. It was fortified by a mud wall with round towers. The assault was made with great resolution, and the troops gained possession of the parapet without being repulsed. On this the garrison called out for quarter, but it was barbarously refused; a general massacre of men, women, and children ensued, only six persons out of 400 being suffered to escape with life.

It now appeared that the revenues collected in this expedition had not been sufficient to defray the expenses of the army; and a report being spread that Salabat-zing was advancing into the Carnatic at the head of his army, along with M. Buffy the French commander, to demand the Mogul's tribute, it was thought proper to recal Colonel Heron to Trinchinopoli. Before this, he had been prevailed on by the Indian chief who accompanied him, to convey to him (Mazuphe Cawn) an investiture of the countries of Madura and Tinivelly for an annual rent of 187,500l. sterling. In his way he was likewise induced by the same chief to make an attempt on a strong fort named *Nellytangaville*, situated about 30 miles west of Tinivelly; and belonging to a refractory Polygar. This attempt, however, proving unsuccessful for want of battering cannon, the colonel returned with Mazuphe Cawn to Trinchinopoli, where he arrived on the 22d of May 1755.

India. The last expedition of this commander was against a mud fort named *Volsynatam*, situated near the entrance of the woods belonging to the Collierie. These people were highly incensed at the plundering of Coil-goody, and particularly at the loss of their sacred images which the rapacious conquerors had carried off. In consequence of this they had already slaughtered a party of Sepoys whom the commanding officer at Madura had sent out to collect cattle. In their march the English army had to go through the pass of Natam, one of the most dangerous in the peninsula. It begins about 20 miles north of Trinchinopoli, and continues for six miles through a wood impassable to Europeans. The road which lay through it was barely sufficient to admit a single carriage at a time, at the same time that a bank running along each side rendered it impossible to widen it. In most places the wood was quite contiguous to the road; and even where part of it had been felled, the eye could not penetrate above 20 yards.—A detachment of Europeans, pioneers, and Sepoys, were sent to scour the woods before the main body ventured to pass through such a dangerous defile. The former met with no opposition, nor did any enemy appear against the latter for a long time. At last the march was stopped by one of the heaviest tumbrils sticking in a slough, out of which the oxen were not able to draw it. The officers of artillery suffered the troops marching before to proceed; and the officer who commanded in the rear of the battalion, not suspecting what had happened, continued his march, while most of the Sepoys who marched behind the rear division of the artillery were likewise suffered to pass the carriage in the slough, which choaked up the road, and prevented the other tumbrils from moving forward, as well as three field pieces that formed the rear division of artillery, and the whole line of baggage that followed. In this divided and defenceless state the rear division of the baggage was attacked by the Indians; and the whole would certainly have been destroyed, had it not been for the courage and activity of Capt. Smith, who here commanded 40 Caffres and 200 Sepoys, with one six-pounder. Considerable damage, however, was done, and the Indians recovered their *gods*; which certainly were not worth the carrying off, being only made of brass, and of a diminutive size.—Colonel Heron was tried by a court-martial for misconduct in this expedition; and being found guilty, was declared incapable of serving the company any longer: soon after which he returned to Europe, and died in Holland.

In the mean time Nanderauze, an Indian prince, formed a scheme to get possession of Trinchinopoli; and in order to compass his end with greater facility, communicated his design to M. de Sauffay the commander of the French troops. But this gentleman having communicated intelligence to the English commander, the enterprise miscarried, and no difference betwixt these two rival nations as yet took place. It does not, however, appear that the English were in the least more solicitous to avoid hostilities than the French; for as soon as the company were informed of the acquisitions made by M. Buffy in the Deccan, it was determined to encourage the Mahrattas to attack Salabat-zing, in order to oblige him to dismiss the French auxiliaries from his service. In order to succeed in this

enterprise, it was necessary to have a commander well experienced in the political systems of the country, as well as in military affairs; and for this purpose Mr Clive, now governor of Fort St David's, and invested with a lieutenant colonel's commission in the king's troops, offered his service. Three companies of the king's artillery, consisting of 100 men each, and 300 recruits, were sent from England on this expedition, who arrived at Bombay on the 27th of November; when on a sudden the presidency of Madras took it into consideration that this expedition could not be prosecuted without infringing the convention made with the French commander. "This (says Mr Grose) was acting with too much caution; for every thing relating to Salabat-zing and the French troops in his service seemed to have been studiously avoided. The court of directors had explained their whole plan to the presidency of Madras; but the ship which had the letters on board was unfortunately wrecked on a rock about 800 miles east of the Cape of Good Hope." The whole expedition was therefore laid aside, and the presidency of Madras directed all their force for the present against Tulagee Angria, who had long been a formidable enemy to the English commerce in those parts.

The dominions of this pirate consisted of several islands near Bombay, and an extent of land on the continent about 180 miles in length, and from 30 to 60 in breadth. He possessed also several forts that had been taken from the Europeans by his ancestors; the trade of piracy having, it seems, been hereditary in the family, and indeed followed by most of the inhabitants of this coast. This was the more dangerous for trading vessels, as the land breezes do not here extend more than 40 miles out at sea, so that the ships are obliged to keep within sight of land; and there was not a creek, harbour, bay, or mouth of a river, along the whole coast of his dominions, where Angria had not erected fortifications, both as stations of discovery and places of refuge to his vessels. His fleet consisted of two kinds of vessels peculiar to this country, named *grabs* and *gallivats*. The former have generally two masts, though some have three; the latter being about 300 tons burthen, and the former 150. They are built to draw little water, being very broad in proportion to their height; but narrowing from the middle to the end, where, instead of bows, they have a prow projecting like a Mediterranean galley, and covered with a strong deck level with the main deck of the vessel, from which it is separated by a bulk-head that terminates the fore-castle. As this construction subjects the grab to pitch violently when sailing against a head sea, the deck of the prow is not inclosed with sides as the rest of the vessel, but remains bare, that the water which comes upon it may pass off without interruption. Two pieces of cannon are mounted on the main deck under the fore-castle, carrying balls of nine or twelve pounds, which point forwards through port-holes cut in the bulk-head, and fire over the prow; those of the broad-side are from six to nine pounders. The gallivats are large row-boats built like the grab, but smaller, the largest scarce exceeding 70 tons burthen. They have two masts, the mizen slightly made, and the main-mast bearing one large and triangular sail. In general they are covered with a spar deck made of split

India. split bamboos, and carry only patereroes fixed on swivels in the gunnel of the vessel; but those of a larger size have a fixed deck, on which they mount six or eight pieces of cannon from two to four pounders. They have 40 or 50 stout oars, by which they may be moved at the rate of four miles an hour.

Angria had commonly a fleet of eight or ten grabs, with 40 or 50 gallivats; which slipped their cables and put out to sea as soon as any vessel had the misfortune to come within sight of the port or bay where they lay. If the wind blew with any strength, their construction enabled them to swim very swiftly: but if it was calm, the gallivats rowed, and towed the grabs.

60 Their manner of attacking ships. As soon as they came within gunshot of the enemy, they assembled astern, and the grabs began the attack, firing at first only at the masts, and choosing the most advantageous positions for this purpose. If the vessel happened to be dismasted, they then drew nearer, and battered her on all sides till she struck; but if the defence was obstinate, they sent a number of gallivats with 200 or 300 soldiers in each, who boarded from all quarters sword in hand.

61 Unsuccessful attempts to reduce this pirate. This piratical state had for more than 50 years been formidable to all the nations in Europe; the English East India company had kept up a naval force for the protection of their trade at the rate of more than 50,000l. annually, and after all found it scarcely adequate to the purpose. An unsuccessful attempt had been made in 1717, by the presidency of Bombay, against the forts Geriah and Kennary, the principal strong holds of Angria.—Another was made in 1722, under Admiral Matthews, against a fort named Coilabley, about 15 leagues south of Bombay: but this also miscarried through the cowardice and treachery of the Portuguese, who pretended to assist the English. In 1735 Fort Geriah was unsuccessfully attacked by a Dutch armament of seven ships, two bomb-ketches, and a numerous body of land forces; while all this time the piracies of Angria went on successfully, and not only trading vessels, but even men of war belonging to different nations, were captured by him, particularly in the month of February 1754, when three Dutch ships of 50, 36, and 18 guns, were burnt or taken by the piratical fleet.

62 Success of Commodore James against his forts. This last success encouraged Angria so much, that he began to build vessels of a large size, boasting that he should be master of the Indian seas. The Mahrattas having implored the assistance of the English against this common enemy, Commodore William James was sent from Bombay on the 22d of March 1755, with the Protector of 44, the Swallow of 16 guns, and two bomb-ketches; but with instructions not to hazard the fleet by attacking any of the pirate's forts, only to blockade the harbours, while the Mahratta army carried on their operations by land. He had scarce begun his voyage when he fell in with a considerable fleet of the pirates, which he would certainly have taken, had it not been for the timidity and dilatory behaviour of his allies, who could not by any means be induced to follow him. They had, however, invested three of the forts, but after a very strange manner; for they durst not approach nearer than two miles, and even there entrenched themselves up to the chin, to be secure against the fire of the fort, which they returned

India. only with one four pounder. The commodore, provoked at this pusillanimous behaviour, determined, for the honour of the British arms, to exceed the orders he had got. Running within 100 yards of a fort named Severndroog, he in a few hours ruined the walls, and set it on fire; a powder magazine also blowing up, the people, to the number of about 1000, abandoning the place, and embarking on board of eight large boats, attempted to make their escape to another fort named Goa, but were all intercepted and made prisoners by the English. The whole force of the attack being then turned upon Goa, a white flag was soon hung out as a signal to surrender. The governor, however, did not think proper to wait the event of a capitulation, but without delay passed over to Severndroog, where he hoped to be able to maintain his ground notwithstanding the ruinous state of the fortifications. The fire was now renewed against this fortress; and the seamen having cut a passage through one of the gates with their axes, the garrison soon surrendered, at the same time that two other forts besieged by the Mahrattas hung out flags of truce and capitulated: and thus were four of Angria's forts, for so many years deemed impregnable, subdued in one day.

63 The pirate finally subdued by Admiral Watson. These successes were followed by the surrender of Bancoote, a strong fortified island, now called Fort Victoria, and which the English retained in possession; but the other forts were delivered up to the Mahrattas. On the arrival of Admiral Watson in the beginning of November 1755, it was determined to root out the pirate at once, by attacking Geriah the capital of his dominions; but it was so long since any Englishman had seen this place, and the reports of its strength had been so much exaggerated, that it was thought proper to reconnoitre it before any attack was made. This was done by Commodore James; who having reported that the fort, though strong, was far from being inaccessible or impregnable, it was resolved to prosecute the enterprise with the utmost expedition and vigour. It was therefore attacked by such a formidable fleet, that Angria, losing courage at their approach, fled to the Mahrattas, leaving Geriah to be defended by his brother. The fort, however, was soon obliged to surrender, with no more loss on the part of the English than 19 men killed and wounded: but it was afterwards acknowledged, that this success was owing principally to the terror of the garrison, occasioned by such a violent cannonade; for their fortifications appeared to have been proof against the utmost efforts of an enemy. All the ramparts of this fort were either cut out of the solid rock, or built of stones at least ten feet long laid edgeways.

In this fortress were found 200 pieces of brass cannon, with six brass mortars, and a great quantity of ammunition and military stores, besides money and effects to the value of 125,000l. Angria's fleet was entirely destroyed, one of the ships having been set on fire by a shell from the English fleet, and the flames having spread from thence to all the rest. About 2000 people were made prisoners; among whom were the wife, children, mother, brother, and admiral of the pirate: but they were treated with the greatest clemency; and his family, at their own request, continued under the protection of the English at Geriah. All the

India. the other forts belonging to Angria soon submitted; so that his power on the coast of Malabar was entirely annihilated.

64 M. Bussy dismissed by Salabat-zing. While the affairs of the English went on thus successfully, M. Bussy had been constantly employed near the person of Salabat-zing, whom he had served in much the same manner that the English had Mohammed Ali Cawn. As he made use of his influence with that prince, however, to enlarge the possessions of the French, and was continually making exorbitant demands upon him, the prime minister of Salabat-zing at length represented to him the danger and shame of allowing a small body of foreigners thus to give law to a great prince; and having formed a powerful combination against the French, at last obtained an order for their dismissal. M. Bussy took his leave without any marks of disgust, having under his command about 600 Europeans, with 5000 Sepoys, and a fine train of artillery. His enemies, however, had no mind to allow him to depart in safety; and therefore sent orders to all the polygars to oppose their passage, sending 6000 Mahrattas after them to harass them on their march.

Notwithstanding this opposition, M. Bussy reached Hyderabad with very little loss. Here he took possession of a garden formerly belonging to the kings of Golconda, where he resolved to keep his post until succours should arrive from Pondicherry and Masulipatam. Here Salabat-zing proposed to attack him; and the better to attain his purpose, applied to the English presidency at Madras for a body of troops to assist him in this service. Nothing could be more agreeable to those who had the power at that place than such an invitation; and a detachment of 400 Europeans and 1500 Sepoys was on the point of being ordered to the assistance of Salabat-zing, when expresses from Bengal informed them of the greatest danger that had ever threatened the British settlements in Indostan.

65 detachment of British troops ordered by M. Bussy, but unexecuted. 66 This danger arose from the displeasure of Surajah Dowla the new nabob of Bengal. His grandfather Aliverdy Khan having died in April or May 1756, Surajah succeeded to the nabobship of Bengal, Bahar, and Orixa. He was congratulated on his accession by Mr Drake the English president at Calcutta, who requested his favour and protection in behalf of his countrymen. This was readily promised, even to a greater degree than what had been shown by his grandfather; but in a short time his resentment was incurred by the imprisonment, as it is said, of Omichund, an eminent Gentoo merchant, who had lived several years under the protection of the English government at Calcutta. Of this, however, Surajah Dowla did not directly complain; but founded his pretence of war upon the conduct of the English in repairing the fortifications of Calcutta; which indeed was absolutely necessary on account of the great likelihood of a war with the French. On this account, however, the nabob signified his displeasure, and threatened an attack if the works were not instantly demolished. With this requisition the president and council pretended to comply; but nevertheless went on with their works, applying first to the French and then to the Dutch for assistance; but as neither of

these nations thought proper to interfere, the English were obliged to stand alone in the quarrel.

Surajah Dowla took the field on the 30th of May 1756, with an army of 40,000 foot, 30,000 horse, and 400 elephants; and on the 23 of June detached 20,000 men to invest the English fort at Cassambazar, a large town situated on an island formed by the western branch of the Ganges. The fort was regularly built, with 60 cannon, and defended by 300 men, but principally Sepoys. The nabob pretending a desire to treat, Mr Watts the chief of the factory, was persuaded to put himself in his power; which he had no sooner done, than he was made a close prisoner, along with Mr Batson a surgeon who accompanied him. The two prisoners were treated with great indignity, and threatened with death; but two of the council who had been sent for by the tyrant's command were sent back again, with orders to persuade the people of the factory to surrender it at discretion. This proposal met with great opposition in the council; but was at last complied with, though very little to the advantage of the prisoners; for they were not only deprived of every thing they possessed, but stripped almost naked, and sent to Huquely, where they were closely confined.

The nabob, encouraged by this success, marched directly to Calcutta, which he invested on the 15th. Though he now threatened to drive the English entirely out of his dominions, yet he proposed an accommodation with Mr Drake, provided he would pay him his duty upon the trade for 15 years, defray the expences of his army, and deliver up the Indian merchants who were in the fort. This being refused, a siege commenced, and the place was taken in three days, through the treachery of the Dutch guard who had the charge of a gate. The nabob promised on the word of a soldier, that no harm should be done the English; nevertheless they were shut up in a prison so strait, that out of 146 all perished in a single night for want of air but 22. It was not, however, supposed that any massacre at this time was intended; and it is probable that he only gave orders to confine the prisoners closely for the night, without taking into consideration whether the place they were confined in was large or small.

The news of this disaster put an end to the expedition projected against M. Bussy; and Colonel Clive was instantly dispatched to Bengal with 400 Europeans and 1000 Sepoys, on board of the fleet commanded by Admiral Watson. They did not arrive till the 15th of December, at a village called *Fulta*, situated on a branch of the Ganges, where the inhabitants of Calcutta had taken refuge after their misfortune. Their first operations were against the forts Busbudgia, Tanna, Fort-William, and Calcutta now in the hands of the enemy. All these were reduced almost as soon as they could approach them. An expedition was then proposed against Huegley, a large town about 60 miles above Calcutta, and the place of rendezvous for all nations who traded to Bengal; its warehouses and shops being always filled with the richest merchandise of the country. This was likewise easily reduced; and the city was destroyed, with the granaries and storehouses of salt seated on each side the river; which

69 Expedition of Admiral Watson and Colonel Clive against the nabob.

India. proved very detrimental to the nabob, as depriving him of the means of subsistence for his army.

Surajah Dowla, enraged at this success of the English, now seemed determined to crush them at once by a general engagement. From this, however, he was intimidated by a successful attack on his camp, which soon induced him to conclude a treaty. This took place on the 9th of February 1757, on the following conditions. 1. That the privileges and immunities granted to the English by the king (Mogul) should not be disputed. 2. That all goods with English orders should pass, by land or water, free of any tax, fee, or imposition. 3. All the Company's factories which had been seized by the nabob should be restored; and the goods, money, and effects, which had been plundered, should be accounted for. 4. That the English should have permission to fortify Calcutta as they thought proper. 5. They should also have liberty to coin their own imports of bullion and gold.

70 Treaty concluded with him.

71 War with the French.

As certain intelligence was now received of a war between France and England, the first object that naturally occurred, after the conclusion of this treaty, was the reduction of the French power in the east; in consequence of which it was represented to Admiral Watson, by a committee of the council of Bengal, that this was the only opportunity he perhaps might ever have of acting offensively against them. An attack would therefore immediately have been made on Chandernagore, had not a deputation arrived from that place, requesting a neutrality in this part of the world until matters should be finally decided in Europe. The negociation, however, was broken off on a suggestion that the government of Chandernagore, being subordinate to that of Pondicherry, could not render any transaction of this kind valid. It remained therefore only to obtain the consent of the nabob to make an attack upon this place: but this seemed not likely to be got; for in ten days after the conclusion of the treaty, he sent a letter to the admiral, complaining of his intention. "It appears (says he) that you have a design to besiege the French factory near Hooghley, and to commence hostilities against that nation. This is contrary to all rule and custom, that you should bring your animosities and differences into my country; for it has never been known, since the days of Timur, that the Europeans made war upon one another in the king's dominions. If you are determined to besiege the French factories, I shall be necessitated, in honour and duty to my king, to assist them with my troops. You are certainly bound to abide by your part of the treaty strictly, and never to attempt or be the occasion of any troubles or disturbances in future within the provinces under my jurisdiction, &c." To this Admiral Watson replied, that "he was ready to desist from his intended enterprize if the French would agree to a solid treaty of neutrality; or if the nabob, as *soubahdar* (viceroy) of Bengal, would, under his hand, guarantee this treaty, and promise to protect the English from any attempts made by the French against their settlements in his absence." This letter did not prove satisfactory; the nabob having been informed by the French agent, that the English designed to turn their arms against him as soon as they had made themselves masters of Chandernagore. This was strenuously denied by the admiral; and a number of let-

ters passed between him and the nabob, in one of which the latter made use of the following expressions, which were supposed to imply a tacit consent that Chandernagore should be attacked. "My forbidding war on my borders was because the French were my tenants, and upon this affair desired my protection: on this I wrote to you to make peace, and no intention had I of favouring or assisting them. You have understanding and generosity: if your enemy with an upright heart claims your protection, you will give him his life; but then you must be well satisfied of the innocence of his intentions; if not, then whatsoever you think right, that do."

73 Chandernagore taken by the English.

Having thus, as was supposed, obtained the consent of the nabob, an attack was made on Chandernagore, which was soon reduced to the necessity of capitulating; though the French made a gallant defence, and, as Mr Ives informs us, "stood to their guns as long as they had any to fire." A messenger was dispatched with the news to Surajah Dowla three days after the place had surrendered, intimating also that the French had been pursued some way up the country. This intelligence, however, seemed to be by no means agreeable, as he could scarce be induced to return an answer. At last he pretended displeasure on account of the design of the English to infringe the treaties, and complained that they had ravaged some parts of his dominions. This was denied on the part of the admiral; who in his turn accused the nabob of breach of promise, and neglect in fulfilling his engagements. The last letter sent by Admiral Watson to the nabob, of date 19th April 1757, concludes in this manner: "Let me again repeat to you, that I have no other views than that of peace. The gathering together of riches is what I despise; and I call on God, who sees and knows the spring of all our actions, and to whom you and I must one day answer, to witness to the truth of what I now write: therefore, if you would have me believe that you wish for peace as much as I do, no longer let it be the subject of our correspondence for me to ask the fulfilment of our treaty, and you to promise and not perform it; but immediately fulfil all your engagements: thus let peace flourish and spread throughout all your country, and make your people happy in the re-establishment of their trade, which has suffered by a ruinous and destructive war." From this time both parties made preparations for war. The nabob returned no answer till the 13th of June, when he sent the following declaration of war. "According to my promises, and the agreement made between us, I have duly rendered every thing to Mr Watts, except a very small remainder: Notwithstanding this, Mr Watts, and the rest of the council of the factory at Cassembuzar, under the pretence of going to take the air in their gardens, fled away in the night. This is an evident mark of deceit, and of an intention to break the treaty. I am convinced it could not have happened without your knowledge, nor without your advice. I all along expected something of this kind, and for that reason I would not recal my forces from Plassey, expecting some treachery. I praise God, that the breach of the treaty has not been on my part," &c.

74 The deposition of the nabob resolved which

Nothing less was now resolved on in the English council at Calcutta than the deposition of the nabob; on

India. which at this time appeared practicable, by supporting the pretensions of Meer Jaffer Ali Cawn, who had with other noblemen entered into a conspiracy against him. Meer Jaffer had married the sister of Aliverdy Cawn, the predecessor of Surajah Dowla; and was now supported in his pretensions by the general of the horse, and by Jagget Seet the nabob's banker, who was reckoned the richest merchant in all India. By these three leading men the design was communicated to Mr Watts the English resident at the nabob's court, and by him to Colonel Clive and the secret committee at Calcutta. The management of the affair being left to Mr Watts and Mr Clive, it was thought proper to communicate the secret to Omichund, through whom the necessary correspondence might be carried on with Meer Jaffer. This agent proved so avaricious, that it was resolved to serve him in his own way; and by a piece of treachery to him also, to gain their point with both parties. Two treaties were therefore written out; in one of which it was promised to comply with Omichund's demand, but in the other his name was not even mentioned; and both these treaties were signed by all the principal persons concerned, Admiral Watson alone excepted, whom no political motives could influence to sign an agreement which he did not mean to keep. These treaties, the same in every respect excepting as to Omichund's affair, were to the following purpose: 1. All the effects and factories belonging to the province of Bengal, Bahar, and Orissa, shall remain in possession of the English, nor should any more French ever be allowed to settle in these provinces. 2. In consideration of the losses sustained by the English company by the capture and plunder of Calcutta, he agreed to pay one crore of rupees, or 1,250,000l. sterling. 3. For the effects plundered from the English at Calcutta, he engaged to pay 50 lacks of rupees, or 625,000l. 4. For the effects plundered from the Gentoos, Moors, and others inhabitants of Calcutta, 20 lacks, or 250,000l. 5. For the effects plundered from the American merchants, inhabitants of Calcutta, seven lacks, or 87,500l. 6. The distribution of all these sums to be left to Admiral Watson, Colonel Clive, Roger Drake, William Watts, James Kilpatrick, and Richard Becher, Esquires, to be disposed of by them to whom they think proper.

77
Surajah Dowla de-
ceased and
buried to
death.

All things being now in readiness, Colonel Clive began his march against Surajah Dowla on the 13th of June, the very day on which Surajah Dowla sent off his last letter for Admiral Watson. Before any act of hostility was committed, however, Colonel Clive wrote the nabob a letter, upbraiding him with his conduct, and telling him at last, that "the rains being so near, and it requiring many days to receive an answer, he had found it necessary to wait upon him immediately." This was followed by the decisive action at Plassey; in which the treachery of Meer Jaffer, who commanded part of the nabob's troops, and stood neuter during the engagement, undoubtedly rendered the victory more easily acquired than it would otherwise have been. The unfortunate nabob fled to his capital with a few that continued faithful to him. He reached the city in a few hours; but not thinking himself safe there, left it the following evening, disguised like a Faquir, with only two attendants. By these he appears

to have been abandoned and even robbed; for on the 3d of July he was found wandering forsaken and almost naked on the road to Patna. Next day he was brought back to Muxadabad; and a few hours after privately beheaded by Meer Jaffer's eldest son, to whose care he had been committed. The usurper took possession of the capital in triumph; and on the 29th of June Colonel Clive went to the palace, and in presence of the rajahs and grandees of the court solemnly handed him the musnud or carpet and throne of state, where he was unanimously saluted soubahdar or nabob, and received the submission of all present.

78

fer's
Bengal.

79
Colonel
Coothe's
expedition
in quest of
Mr Law.

While these transactions were going forward with the nabob, the utmost efforts were used to expel the French entirely from Bengal. By the articles of capitulation at Chandernagore, the whole of that garrison were to continue prisoners of war; but about the time of signing the treaty, Mr Law with a small body of troops made his escape out of Cassembuzar, and bent his march towards Patna. There he had been protected by the late nabob; and on the commencement of fresh hostilities, had collected about 200 French, the only remains of that nation in Bengal, to make an attempt to succour him. With these he was within two hours march of Surajah Dowla's camp when the battle of Plassey was fought; on hearing the news of which he stopped: but afterwards being informed of the nabob's escape, he marched again to his assistance, and was within a few hours of joining him when he was taken. Three days after he was pursued by Major Eyre Coothe at the head of 223 Europeans, three companies of Sepoys, 50 Lascars or Indian sailors, and 10 Marnutty men or pioneers to clear the roads, together with two pieces of cannon, six pounders. On this expedition the major exerted his utmost diligence to overtake his antagonist, and spent a very considerable space of time in the pursuit; for though he set out on the 6th of July, he did not return to Muxadabad till the 1st of September. Mr Law, however, had the good fortune to escape; but though the major did not succeed in what was proposed as the principal end of his expedition, he was, nevertheless, says Mr Ives, of considerable service to the company and to his country in general. He had obliged Ramnarain, the most powerful rajah in the country, to swear allegiance to Meer Jaffer; he laid open the interior state of the northern provinces; and, in conjunction with Mr Johnstone, gave the company some insight into the saltpetre business, from which such advantages have since been derived to the public.

80
Death of
Admiral
Watson.

Before the return of Major Coothe, Admiral Pocock had succeeded to the command of the fleet, in consequence of the decease of Admiral Watson, who died on the 16th of August. The joy of the British was considerably damped by the loss of this gentleman, who had gained a great and deserved reputation both in the military line and every other. News were also received, that the French had been very successful on the coast of Coromandel. Salabat-zing, as has already been observed, had applied to the English for assistance against the French; but as they were prevented from performing their agreement by the disaster at Calcutta, he found himself under a necessity of accommodating the differences with his former friends, and to admit them again into his service. M. Bussy was now reinforced by the troops under Mr Law; who

romandel
coast.

had collected as many Europeans in his journey as made up 500 with those he had at first. With these he undertook to reduce the English factories of Ingeram, Bandermalanka, and Vizagapatnam. As none of the two former places were in any state of defence, the greatest part of the company's effects were put on shipboard on the first alarm; but as Vizagapatnam was garrisoned by 140 Europeans and 420 Sepoys, it was supposed that it would make some defence. If any was made, however, it appears to have been very trifling; and by the conquest of this the French became masters of all the coasts from Ganjam to Maffulipatnam. In the southern provinces the like had success attended the British cause. The rebel Polygars having united their forces against Mazuphe Cawn, obtained a complete victory over him; after which the English Sepoys, being prevailed upon to quit Madura, the conqueror seized upon that city for himself.

In the beginning of 1758, the French made an attempt on Trinchinopoly. The command was given to M. d'Autreuil, who invested the place with 900 men in battalion, with 4000 Sepoys, 100 hussars, and a great body of Indian horse. Trinchinopoli was then in no condition to withstand such a formidable power, as most of the garrison had gone to besiege Madura under Captain Caillaud; but this commander having received intelligence of the danger, marched back with all his forces, and entered the town by a difficult road which the enemy had neglected to guard; and the French general, disconcerted by this successful manoeuvre, drew off his forces, and returned to Pondicherry.

This fortunate transaction was succeeded by the siege of Madura, in which the English were so vigorously repulsed, that Captain Caillaud was obliged to turn the siege into a blockade in order to reduce the place by famine. But before any progress could be made in this way, Mazuphe Cawn was prevailed upon to give it up for the sum of 170,000 rupees. A large garrison of Sepoys was again put into the place, and Captain Caillaud returned to Trinchinopoly.

An unsuccessful attempt was now made by Colonel Ford on Nellore, a large town surrounded by a thick mud wall, with a dry ditch on all sides but one, where there is the bed of a river always dry but in the rainy season. The enterprise is said to have proved unsuccessful through the unheard-of cowardice of a body of Sepoys, who having sheltered themselves in a ditch, absolutely refused to stir a step farther, and rather chose to allow the rest of the army to march over them to the assault, than to expose themselves to danger. Several other enterprises of no great moment were undertaken; but the event was on the whole unfavourable to the English, whose force by the end of the campaign was reduced to 1718 men, while that of the French amounted to 3400 Europeans, of whom 1000 were sent to Pondicherry.

82
French de-
feated at
sea by Ad-
miral Po-
cock.

Both parties now received considerable reinforcements from Europe; Admiral Pocock being joined on the 24th of March by Commodore Stevens with a squadron of five men of war, and the French by nine men of war and two frigates, having on board General Lally with a large body of troops. The English admiral no sooner found himself in a condition to cope with the enemy

than he went in quest of them; and an engagement took place, in which the French were defeated with the loss of 600 killed, and a great many wounded, while the English had only 29 killed and 89 wounded. The former returned to Pondicherry, where they landed their men, money, and troops. After the battle three of the British captains were tried for misbehaviour, and two of them dismissed from the command of their ships. As soon as his vessels were refitted, the admiral sailed again in quest of the enemy, but could not bring them to an action before the 3d of August, when the French were defeated a second time, with the loss of 251 killed, and 602 wounded.

India.

They are
defeated a
second time.

Notwithstanding this success at sea, the English were greatly deficient in land forces; the re-establishment of their affairs in Bengal having almost entirely drained the settlements on the coast of Coromandel of the troops necessary for their defence. The consequence of this was the loss of Fort St David, which General Lally reduced, destroying the fortifications, demolishing also the adjacent villages, and ravaging the country in such a manner as filled the natives with indignation, and in the end proved very prejudicial to his affairs. He proved successful, however, in the reduction of Devicottah, but was obliged to retreat with loss from before Tanjore, his army being greatly distressed for want of provisions; and money in particular being so deficient, that on the 7th of August the French seized and carried into Pondicherry a large Dutch ship from Batavia, bound to Negapatnam, and took out of her about 5000l. in specie.

84
Take Fort
St David.

From this time the affairs of the French daily declined. On their retreat from Tanjore, they abandoned the island of Seringham; however, they took Tripasfore, but were defeated in their designs on the important post of Chinglapet, situated about 45 miles south-west of Madras. Their next enterprises on Fort St George and Madras were equally unsuccessful. The latter was besieged from the 12th of December 1758 to the 17th of February 1759, when they were obliged to abandon it with great loss; which disaster greatly contributed to depress their spirits, and abate those sanguine hopes they had entertained of becoming masters in this part of the world.

The remainder of the year 1759 proved entirely favourable to the British arms. M. d'Ache the French admiral, who had been very roughly handled by Admiral Pocock on the 3d of August 1758, having refitted his fleet, and being reinforced by three men of war at the islands of Mauritius and Bourbon, now ventured once more to face his antagonist, who on his part did not at all decline the combat. A third battle ensued on the 10th of September 1759, when the French, notwithstanding their superiority, both in number of ships and weight of metal, were obliged to retreat with considerable loss; having 1500 men killed and wounded, while those on board the English fleet did not exceed 569. By the 17th of October the English fleet was completely refitted; and Admiral Pocock having been joined by a reinforcement of four men of war, soon after returned to England.

85
French de-
feated a
third time
by Admira-
Pocock.

All this time the unfortunate General Lally had been employed in unsuccessful endeavours to retrieve the affairs of his countrymen: still, however, he attempted to act on the offensive; but his fate was at last decided

by

by laying siege to Wandewash, which had lately been taken by Colonel Coote. The advantage in numbers was entirely in favour of the French general; the English army consisting only of 1700 Europeans, including artillery and cavalry, while the French amounted to 2200 Europeans. The auxiliaries on the English side were 3000 black troops, while those of the French amounted to 10,000 black troops and 300 Caffres; nor was the odds less in proportion in the artillery, the English bringing into the field only 14 pieces of cannon and one howitzer, while the French had 25 pieces in the field, and five on their batteries against the fort. The battle began about 11 o'clock on the 22d of January 1760, and in three hours the whole French army gave way and fled towards their camp; but quitted it on finding themselves pursued by the English, who took all their cannon except three small pieces. They collected themselves under the walls of Cheltaput, about 18 miles from the field of battle, and soon after retired to Pondicherry. Colonel Coote caused the country to be wasted to the very gates of this fortress, by way of retaliation for what the French had done in the neighbourhood of Madras. He then set about the siege of Cheltaput, which surrendered in one day; a considerable detachment of the enemy was intercepted by Captain Smith; the fort of Timmery was reduced by Major Monson, and the city of Arcot by Captain Wood. This last conquest enabled the English to restore the nabob to his dominions, of which he had been deprived by the French; and it greatly weakened both the French force and interest in India. M. Lally, in the mean time, had recalled his forces from Seringham, by which means he augmented his army with 500 Europeans. All these were now shut up in Pondicherry, which was become the last hope of the French in India. To complete their misfortunes, Admiral Cornish arrived at Madras with six men of war; and as the French had now no fleet in these parts, the admiral readily engaged to co-operate with the land forces. The consequence was the reduction of Carical, Chellambrum, and Verdachellum, by a strong detachment under Major Monson; while Colonel Coote reduced Permucoil, Alamperva, and Waldour. Thus he was at last enabled to lay siege to Pondicherry itself. Previous to this, however, it had been blockaded by sea and land, which reduced the place to great straits for want of provisions, and induced a mutinous disposition among the garrison. The batteries were not opened till the beginning of December 1760; and the place capitulated on the 15th of January 1761, by which an end was put to the power of the French in this part of the world.

While the English were thus employed in effectually reducing the power of their rivals in every part of India, Meer Jaffier, the nabob of Bengal, who had been raised to that dignity by the ruin of Surajah Dowla, found himself in a very disagreeable situation. The treasure of the late nabob had been valued at no less than 64 crore of rupees, about 80 millions sterling; and in expectation of such a vast sum, Meer Jaffier had no doubt thoughtlessly submitted to the enormous exactions of the English already mentioned. On his accession to the government, however, the treasure of which he became master fell so much short of expectation, that he could by no means fulfil his engagements

to them and supply the expences of government at the same time. This soon reduced him to the necessity of mortgaging his revenues to supply present demands; and by this ruinous expedient he put it out of his own power ever to extricate himself. In this dilemma his grandees became factious and discontented, his army mutinous for want of pay, and he rendered himself odious to his subjects by the exactions he was necessitated to lay upon them. The English, who for their own interest had raised him to the supreme power, no sooner found that he was incapable of answering their purpose any longer, than they began to scheme against him; and in order to have some colour of reason for pulling down the man whom they had just set up, they either invented or gave ear to the most malicious calumnies against him. The charges brought against him were shortly these: 1. That soon after his advancement he had resolved to reduce that power which raised him to the dignity. 2. That, to effect this, he assassinated or banished every person of importance whom he suspected of being in the English interest. 3. That he negociated with the Dutch to introduce an armament for the expulsion of the English. 4. That he had in different instances been guilty of the deepest deceit and treachery towards the English, his best benefactors and allies. 5. That at three different periods the English commander in chief had been basely deserted both by the nabob and his son, when he and the troops were hazarding their lives for them. 6. That he meditated a secret and separate treaty with Shah-Zad-dah, the Mogul's son, and had intended to betray the English to him. 7. That the whole term of his government had been one uninterrupted chain of cruelty, tyranny, and oppression. 8. That he meditated, and was near carrying into execution, an infamous secret treaty with the Mahrattas, which would have proved the total destruction of the country if it had taken place. 9. That he threw every possible obstruction in the way of the collection of the English *tunkas* or assignments upon lands. 10. That he encouraged the obstructions given to the free currency of the English *liccas*; by which the company suffered heavy losses. 11. That by his cruelties he had rendered it scandalous for the English to support his government any longer; and, 12. That by his misconduct, he had brought the affairs of the company as well as his own into the utmost danger of ruin.

In what manner these charges were supported it is difficult to know, nor perhaps were the accusers very solicitous about the strength of their evidence. This seems the more probable, as the accusations of cruelty were, in some instances at least, void of foundation. On the 13th of June 1760, Mr Holwel wrote from Calcutta to Mr Warren Hastings, that by express he had received intelligence of the murder of the princesses of Aliverdy Khan and Shah Amet, in a most inhuman manner, by Meer Jaffier's orders. He was said to have sent a jemmatdaar with 100 horse to Jesseraut Khan to carry this bloody scheme into execution; with separate orders to the jemmatdaar to put an end to their lives. He refused acting any part in the tragedy, and left it to the other; who carried them out by night in a boat, tied weights to their legs, and threw them overboard. They struggled for some time, and held by the gunwale of the boat; but by strokes on their heads,

and cutting off their hands, they were at last forced off and drowned. In like manner we were told that many others of Surajah Dowla's relations had perished; yet when it was thought proper to replace Meer Jaffer in 1761, all these dead persons were found *alive* excepting two. It must also be remembered, in behalf of the unfortunate nabob, that besides the sums exacted of him by the English at his accession, he had ceded to them a large extent of territory, and granted them so many immunities in trade, that he had in a manner deprived himself of all his resources; and it was impossible for him to defray the necessary expences without either extorting money from his subjects, or infringing the privileges he had so inconsiderately granted.

90
Different accounts of his deposition.

There were two accounts of this remarkable revolution published, materially differing from one another. The first was given in a memorial drawn up at a consultation at Fort William, November 10. 1760. where were present Henry Vansittart, Esq. president; William Ellis, B. Sumner, William M'Guire, Henry Verelst, and Henry Smyth, Esqs. "We resolved (says the governor) to give the nabob the next day (October 19. 1760) to reflect upon the letters I had delivered him, proposing some measures for regulating these abuses. I heard nothing from him all that day; but found by my intelligence that he had been in council at his old advisers, whose advice, I was sure, would be contrary to the welfare of the country and of the company. I therefore determined to act immediately on the nabob's fear. There could not be a better opportunity than the night of the 19th offered, it being the conclusion of the Gentoo feast, when all the principal people of that cast would be pretty well fatigued with their ceremonies. Accordingly I agreed with Colonel Caillaud, that he should cross the river with the detachment between three and four in the morning; and having joined Cossim Ali Khan and his people, march to the nabob's palace, and surround it just at daybreak. Being extremely desirous to prevent disturbance or bloodshed, I wrote a letter to the nabob, telling him, I had been waiting all the day in expectation that he would have settled the urgent affairs upon which I conferred with him yesterday; but his having favoured me with no answer, plainly showed that all I could represent to him for the good of his country would have no effect, as long as his evil counsellors were about his person, who would in the end deprive him of his government and ruin the company's affairs. For this reason I had sent Colonel Caillaud with forces to wait upon him, and to expel those bad counsellors, and place his affairs in a proper state, and I would shortly follow. This letter I gave to the colonel, to send to the nabob at such a time as he should think most expedient. Measures were taken at the same time for seizing his three unworthy ministers, and to place Cossim Ali Khan in the full management of all the affairs, in quality of deputy and successor to the nabob.

"The necessary preparations being made with all care and secrecy possible, the colonel embarked with the troops, joined Cossim Ali Khan without the least alarm, and marched into the court-yard of the palace just at the proper instant. The gates of the inner court being shut, the colonel formed his men without, and sent the letter to the nabob, who was at first in a great rage, and long threatened that he would make what

resistance he could, and take his fate. The colonel forbore all hostilities, and several messages passed between him and the nabob. The affair remained in this doubtful state for two hours, when the nabob, finding his persisting was to no purpose, sent a message to Cossim Ali Khan, informing him that he was ready to send the seals and all the ensigns of dignity, provided he would agree to take the whole charge of the government upon him, to discharge all arrears due to the troops, to pay the usual revenue to the king, to save his life and honour, and to give him an allowance sufficient for his maintenance. All these conditions being agreed to, Cossim Ali was proclaimed; and the old nabob came out to the colonel, declaring that he depended on him for his life. The troops then took possession of all the gates; and the old nabob was told, that not only his person was safe, but his government too if he pleaded, of which it was never intended to deprive him. He answered, that he had now no more business in the city, where he should be in continual danger from Cossim Ali Khan; and if he was permitted to go and live at Calcutta, he should be contented. Cossim Ali Khan was now placed on the musnud, and the people in general seemed much pleased with the revolution. The old nabob did not think himself safe even for one night in the city. Cossim Ali Khan supplied him with boats, and permitted him to take away about 60 of his family, with a reasonable quantity of jewels. He begged that he might sleep in his boat that night; which he accordingly did, and on the morning of the 22d of October he set out for Calcutta, and arrived there on the 29th. He was met by a deputation from the council, and treated with every mark of respect due to his former dignity."

The second account of this affair was not published till the 11th of March 1762, and was signed Eyre Coote, P. Amyatt, John Cavauc, W. Ellis, S. Batson, H. Verelst. "In September 1760 (say they), when there was not the least appearance of a rupture or disgust between us and the nabob, but friendship and harmony subsisting, Meer Cossim Khan his son-in-law came down to Calcutta, and having staid a short time returned to Moorshedabad. A few days after, Mr Vansittart went up to that city on the pretence of a visit to the nabob Meer Jaffer. Colonel Caillaud, with 200 Europeans and some Sepoys, attended him; who, it was pretended, were going to join the army at Patna. When Mr Vansittart arrived at Moradbaug, the nabob paid him two visits; at the last of which Mr Vansittart gave him three letters, proposing the reformation of the abuses in his government, insisted on his naming some person among his relations to take charge of the subahship, and particularly recommended Cossim Ali Khan, who was sent for, and the nabob desired to stay till he came; but the nabob being greatly fatigued, was suffered to depart to his palace. The night and following day passed in concerting measures with Cossim Ali how to put in execution the plan before agreed on in Calcutta, where a treaty was signed for this purpose. In consequence of these deliberations, our troops crossed the river next night, and being joined by Cossim and his party, surrounded the nabob's palace. A letter from Mr Vansittart was sent in to the nabob, demanding his compliance with what had been proposed to him. To this the nabob returned for answer, 'that he never

India.

India. never expected such usage from the English; that while a force was at his gates, he would enter into no terms. A message was sent in, that if he did not directly comply, they should be obliged to storm the palace. Altoned and terrified at this menace, he opened the gates, exclaiming, that 'he was betrayed; that the English were guilty of perjury and breach of faith; that he perceived their designs against his government; that he had friends enough to hazard at least one battle in his defence: but although no oaths were sacred enough to bind the English, yet as he had sworn to be their faithful friend, he would never swerve from his engagement, and rather suffer death than draw his sword against them.'" So suspicious was he of being sold, that he desired to know what sum of money Cossim Ali Khan was to give for the subahship, and he would give half as much more to be continued. He hoped, however, if they intended to dethrone him, that they would not leave him to the mercy of his son-in-law, from whom he feared the worst; but wished they would carry him from the city, and give him a place of safety in Calcutta. "This last request of the nabob was construed in the light of a voluntary resignation. Our troops took possession of the palace; Meer Cossim was raised to the musnud; and the old nabob hurried into a boat with a few of his domestics and necessaries, and sent away to Calcutta in a manner wholly unworthy of the high rank he so lately held, as was also the scanty subsistence allowed him for his maintenance at Calcutta by his son-in-law. Thus was Jaffier Ali Khan deposed, in breach of a treaty founded on the most solemn oaths, and in violation of the national faith."

According to this account, the servants of the company, who were the projectors of the revolution, made no secret that there was a present promised them of 20 lacks of rupees from Cossim, who was desirous of making the first act of his power the assassination of Jaffier, and was very much displeas'd when he found that the English intended giving him protection at Calcutta.

It could scarce be supposed that Meer Cossim, raised to the nabobship in the manner we have related, could be more faithful to the English than Meer Jaffier had been. Nothing advantageous to the interests of the company could indeed be reasonably expected from such a revolution. No successor of Meer Jaffier could be more entirely in subjection than the late nabob, from his natural imbecility, had been. This last consideration had induced many of the council at first to oppose the revolution; and indeed the only plausible pretence for it was, that the administration of Meer Jaffier was so very weak, that, unless he was aided and even controuled by some persons of ability, he himself must soon be ruined, and very probably the interests of the company along with him. Meer Cossim, however, was a man of a very different disposition from his father-in-law. As he knew that he had not been served by the English out of friendship, so he did not think of making any return of gratitude; but instead of this, considered only how he could most easily get rid of such troublesome allies. For a while, however, it was necessary for him to dissemble, and to take all the advantage he could of the power of his allies whilst it could be serviceable to him. By their assistance he cleared his dominions of invaders, and strengthened his fron-

India. tiers against them; he reduced, by means of the same assistance, the rajahs or independent Indian chiefs who had rebelled in the time of his predecessor, obliging them to pay the usual tribute; by which means he repaired his finances, and thereby secured the discipline and fidelity of his troops. Having thus, by the assistance of the English forces, brought his government into subjection, he took the most effectual means of securing himself against their power. As the vicinity of his capital, Muxadabad, to Calcutta, gave the English factory there an opportunity of inspecting his actions, and interrupting his designs when they thought proper, he took up his residence at Mongheer, a place 200 miles farther up the Ganges, which he fortified in the best and most expeditious manner he could. Being very sensible of the advantages of the European discipline, he resolved to form his army on a new model. For this purpose he collected all the Armenian, Persian, Tartar, and other soldiers of fortune, whose military characters he supposed might serve to raise the spirits of his Indian forces, and abate their natural timidity. He also carefully collected every wandering European who had borne arms, all the Sepoys who had been dismissed from the English service, distributing them among his troops, in order to teach them the English exercise. He changed the fashion of the Indian muskets from matchlocks to firelocks; and as their cannon were almost as deficient as their small arms, he procured a pattern of one from the English, by which he soon formed a train of artillery; and having thus done every thing in his power to enable himself to withstand the English by force of arms, he resolved also to free his court from their emissaries, by imprisoning or putting to death every person of any consequence in his dominions who had shown any attachment to their interest.

His next step was to free himself from some of those restraints which his predecessor Meer Jaffier, and even he himself, had been obliged to lay upon the trade of the country, he order to gratify the avarice of his European allies. At his accession indeed he had ceded to the company a tract of land worth no less than 700,000l. annually, besides 70,000l. a-year on other accounts. All this, however, was not sufficient; the immunities granted them in trade were of still worse consequences than even those vast concessions. He knew by experience the distress which these immunities had brought upon his predecessor, and therefore determined to put an end to them. In pursuance of this resolution, he began, in the year 1762, everywhere to subject the English traders to the payment of certain duties throughout his dominions, and required that their disputes, if beyond the limits of their own jurisdiction, should be decided by his magistrates. This gave such an alarm at Calcutta, that, in November 1762, the governor Mr Vansittart waited on him in person at Mongheer, in order to expostulate with him upon the subject. The nabob answered his remonstrances in the following manner. "If (said he) the servants of the English company were permitted to trade in all parts, and in all commodities, custom free, as many of them now pretend, they must of course draw all the trade into their own hands, and my customs would be of so little value, that it would be much more for my interest to lay trade entirely open, and collect no customs from any person whatever upon any

India.

any kind of merchandize. This would draw a number of merchants into the country, and increase my revenues by encouraging the cultivation and manufacture of a large quantity of goods for sale, at the same time that it would effectually cut off the principal subject of disputes which had disturbed the good understanding between us, an object which I have more than any other at heart."

By these intimations Mr Vanfittart was very much disconcerted; nor indeed was it in any person's power to devise a plausible answer. What the nabob had threatened was evidently in his power; and though he had laid the trade entirely open, no reasonable fault could have been found with him. The proceeding, however, tended evidently to destroy the private trade carried on by the gentlemen of the factory; and even to prejudice, as they said, that of the company itself. Mr Vanfittart therefore thought proper to submit to certain regulations, by which the trade of the English was put under certain restrictions.

This new agreement being instantly put in execution on the part of the nabob, excited the utmost indignation at Calcutta. On the 17th of January 1763, the council passed a resolution, disavowing the treaty made by the governor, and affirmed that he assumed a right to which he was by no means authorized; that the regulations proposed were dishonourable to them as Englishmen, and tended to the ruin of all public and private trade; and that the president's issuing out regulations independent of the council was an absolute breach of their privileges. They sent orders therefore to all the factories, that no part of the agreement between the governor and nabob should be submitted to. Application was again made to Meer Cossim to persuade him to a third agreement; but before the success of this negotiation could be known, hostilities commenced on the part of the English.

There was at that time in the city of Patna (situated on the Ganges, about 300 miles above Calcutta), a fortified factory belonging to the East India company, where were a few European and Indian soldiers. By this factory the city was suddenly attacked on the 25th of June 1763, and instantly taken, though it was defended by a strong garrison, and the fortifications had been newly repaired. The governor and garrison fled out into the country on the first appearance of danger; but perceiving that the victors took no care to prevent a surprise, he suddenly returned with a reinforcement from the country, retook the city, and either cut in pieces or drove into their fort all the English who were in it, after having been only four hours in possession of the place. The English, disheartened by this disaster, did not now think themselves able to defend their fort against the Indians; for which reason they left it, with a design to retreat into the territories of a neighbouring nabob; but being pursued by a superior force, they were all either killed or taken.

This piece of perfidy, for such it certainly was, the nabob repaid by another, viz. slaughtering the deputies who had been sent him by the council of Calcutta to treat about a new agreement with regard to commercial affairs. They set out from Mongheer on the 24th of June, having been unable to bring Meer Cossim to any terms; and though he furnished them with the

usual passports, yet, as they were passing the city of Muxadabad, they found themselves attacked by a number of troops assembled for that purpose on both sides of the river, whose fire killed several gentlemen in the boats. Mr Amyatt, the chief of the embassy, landed with a few Sepoys, whom he forbade to fire, and endeavoured to make the enemy's troops understand that he was furnished with the nabob's passports, and had no design of committing any hostilities; but the enemy's horse advancing, some of the Sepoys fired notwithstanding Mr Amyatt's orders to the contrary. On this a general confusion ensued, and Mr Amyatt, with most of the small party who attended him, were cut in pieces.

These acts of treacherous hostility were soon followed by a formal declaration of war. Meer Jaffier, notwithstanding the crimes formerly alleged against him, was proclaimed nabob of Bengal, and the army immediately took the field under the command of Major Adams. The whole force, however, at first consisted only of one regiment of the king's troops, a few of the company's, two troops of European cavalry, ten companies of Sepoys, and 12 pieces of cannon. These very soon came to action with the enemy; and having got the better in two skirmishes, cleared the country of them as far as Cassimbuzar river, a branch of the Ganges, which lay between Calcutta and Muxadabad, or Moorshedabad, the capital of the province.

The war was now carried on with uninterrupted success on the part of the English; nor does it appear that all the pains taken by Meer Cossim to discipline his troops had made them in the least more able to cope with the Europeans. The English were suffered to pass the river without opposition; but an army of 10,000 Indians were advantageously posted between the river and the city. These were entirely defeated, and Major Adams pushed on directly for the capital. In his way he found the Indians again strongly posted with intrenchments 15 feet high, and defended by a numerous artillery. This strong post was taken by stratagem; a feint being made with a small body of troops against that part where the enemy had collected their greatest strength. Thus the attention of the enemy was drawn entirely to that place, without regarding others where no attack was apprehended. The greatest part of the English army, however, had in the night-time marched round the Indian fortification, and by daybreak made a furious assault on a place where there was only a slight guard. These instantly fled; the intrenchments were abandoned; and the city, which was protected only by them, fell of course into the hands of the conquerors.

This success of the English served only to make them redouble their diligence. They now penetrated into the heart of the province, crossed the numerous branches of the Ganges, and traversed morasses and forests in quest of their enemy. Meer Cossim, on the other hand, was not wanting in his defence; but the utmost efforts he could use were totally insufficient to stop the career of an enemy so powerful and now flushed with victory. The two armies met on the banks of a river called *Nunas Nullas*, on the 2d of August 1763. The Indians had chosen their post with great judgment, and had much more the appearance of an European army than ever was observed before, not only in their arms

India.

93

Meer Cossim entirely defeated at Nunas Nullas.

and accoutrements, but in their division into brigades, and even in their cloathing. The battle was much more obstinate than usual, being continued for four hours; but though the Indian army consisted of no fewer than 20,000 horse, and 8000 foot, the English proved in the end victorious, and the enemy were obliged to quit the field with the loss of all their cannon.

From this time the Indians did not attempt any regular engagement with the English. They made a stand indeed at a place called *Auda Nulla*, which they had fortified in such a manner that it seemed proof against any sudden attack. But here also they suffered themselves to be deceived in a manner similar to that above-mentioned, and the place was taken with great slaughter. They now abandoned a vast tract of country; and though there were several very defensible posts one behind another, so much were they disheartened by this misfortune, that they never attempted to stop the progress of the English, but laid open the whole country to the very gates of Mongheer.

The next operation was the siege of Mongheer itself; which notwithstanding all the pains Meer Cossim had been at to fortify it, held out no more than nine days after the trenches were opened: so that nothing now remained to complete the conquest of Bengal but the reduction of the city of Patna. The unfortunate Meer Cossim, in the mean time, enraged at the irresistible progress of the English, vented his rage on the unhappy prisoners taken at Patna; all of whom, to the number of about 200, he caused to be inhumanly murdered. This villany was perpetrated by one *Somers*, a German, who had originally been in the French service, but deserted from them to the English East India company, and from the company to Meer Cossim. This assassin, by the Indians called *Soomeroo*, having invited the English gentlemen to sup with him, took the opportunity of borrowing their knives and forks, on pretence of entertaining them after the English manner. At night, when he arrived, he stood at some distance in the cook-room to give his orders; and as soon as the two first gentlemen, Mr Ellis and Lushington, entered, the former was seized by the hair, his head pulled backward, and his throat cut by another. On this Mr Lushington knocked down the murderer with his fist, seized his sword, wounded one and killed two before he himself was cut down. The other gentlemen being now alarmed, defended themselves, and even repulsed the Sepoys with plates and bottles. Somers then ordered them on the top of the house to fire down on the prisoners; which they obeyed with reluctance, alleging that they could not think of murdering them in that manner, but if he would give the prisoners arms, they would fight them; on which he knocked several of them down with bamboes. The consequence was, that all the gentlemen were either shot or had their throats cut. Dr Fullarton was the only person who escaped, having received a pardon from the tyrant a few days before the massacre.

This inhumanity was far from being of any service to the cause of Meer Cossim. Major Adams marched without delay from Mongheer to Patna; and as the place was but indifferently fortified, it could make but a feeble resistance. The cannon of the English soon made a practicable breach, and in no longer time than

eight days this great city was taken by storm. Thus the nabob was deprived of all his fortified places, his army reduced to a small body, and himself obliged to fly to Sujah Dowla nabob of Oude, who acted as grand vizier to the Mogul. Here he was kindly received, and an asylum promised for his person, but admittance was refused to his army, nor would this prince consent at any rate to make his country a seat of war. The English were now entire masters of Bengal; for though Meer Jaffier was proclaimed nabob, it is not to be supposed that he had now any authority farther than what they pleased to give him. Major Adams did not long survive the conquest of Patna, which was taken on the 6th of November 1763; he died in the month of March 1764.

Meer Cossim being thus driven out, an agent was sent from Calcutta to Sujah Dowla, proposing an alliance with him and the Mogul, who was along with him, and offering to assist them against Meer Cossim or any other enemy who should attempt an invasion of their dominions; in return for which, it was expected that they should declare themselves open enemies to Meer Cossim, and use their utmost endeavours to seize and deliver him up with all his effects. This design was communicated to Major Adams on the 8th of December 1763; but as he was next day to resign the command of the army, Major Carnac was desired to take the command upon him, and to watch the motions of Meer Cossim, as well as to guard the dominions of Meer Jaffier against any hostilities which might be attempted. It was also resolved, that in case Meer Cossim should prevail upon the Mogul and Sujah Dowla to assist him, Major Carnac was desired to advance to the banks of the river Carumnassa, and there oppose the entrance of any hostile army.

It soon appeared that the friendship of the English was not what Sujah Dowla desired. He considered them as rapacious usurpers, who having got a footing in the country under pretence of commerce, could be satisfied with nothing less than the entire possession of it, to the ruin of the natural inhabitants. In the beginning of February 1764, therefore, it was known that Sujah Dowla had determined to assist Meer Cossim in attempting to recover Bengal. The president and council on this wrote him, that though they heard such a report, they could not believe it, considering the former connections subsisting between him and the chiefs of the company, and were persuaded he would not act in such an unjust manner: but if it really was his intention to espouse the cause of Meer Cossim, they informed him that they were resolved to keep Bengal free from troubles, and carry the war into the dominions of Sujah Dowla himself. To this the nabob replied by enumerating the many favours conferred on the English by the Mogul. "Notwithstanding these (says he) you have interfered in the king's country, possessed yourselves of districts belonging to the government, and turned out and established nabobs at pleasure, without the consent of the imperial court. Since you have imprisoned dependants on the court, and exposed the government of the king of kings to contempt and dishonour; since you have ruined the trade of the merchants of the country, granted protection to the king's servants, injured the revenues of the imperial court, and crushed the inhabitants by your acts of violence; and

since you are continually sending fresh people from Calcutta, and invading different parts of the royal dominions; to what can all those wrong proceedings be attributed, but to an absolute disregard to the court, and a wicked design of seizing the country to yourselves? If these disturbances have arisen from your own improper desires, desist from such behaviour in future; interfere not in the affairs of government; withdraw your people from every part, and send them to their own country; carry on the company's trade as formerly, and confine yourselves to commercial affairs," &c. Another letter, much to the same purpose, was sent to Major Carnac; but the president and council of Calcutta, instead of paying any regard to the remonstrances of the nabob, determined to commence an immediate and offensive war against him.

Notwithstanding this resolution, several difficulties occurred in carrying on a war at this time. The principal were the death of Major Adams, whose name had become formidable to the Indians, and the mutinous disposition of the army. The former was obviated by the appointment of Colonel Hector Munro, who, in military skill, appeared nothing inferior to his predecessor; and the mutinous disposition of the soldiery was got the better of by a most severe example of the mutineers, 24 of whom were blown away from the mouths of cannon. Hostilities were commenced on the part of Meer Cossim, who cut off a small party of English troops, and sent their heads to the Mogul and Sujah Dowla. An army of 50,000 men was collected, with a most formidable train of artillery, such as might be supposed to follow an European army of equal numbers. This prodigious armament seems to have effaced all the caution of Meer Cossim; for though he had formerly experienced the bad effects of engaging the English in a pitched battle, yet he now thought proper to try his fortune a second time in the same way. The two armies met on the 22d of October 1764, at a place called *Buxard*, on the river Carumnassa, about 100 miles above the city of Patna. The event was similar to that of other engagements with the English, to whom it never was possible for any advantages either in situation or number to make the Indians equal. The allied army was defeated with the loss of 6000 killed on the spot, 130 pieces of cannon, a proportionable quantity of military stores, and all their tents ready pitched; while, on the side of the conquerors, only 32 Europeans and 239 Indians were killed, and 57 Europeans and 473 Indians wounded.

The only place of strength now belonging to the allies on this side the river was a fort named *Chanda Geer*. The reduction of this place, however, might well have been deemed impracticable, as it stood on the top of a high hill, or rather rock, situated on the very brink of the Ganges, by which it could be constantly supplied with provisions; and as to military stores, it could not stand in need of any as long as stones could be found to pour down on the assailants. Notwithstanding all these difficulties, however, Colonel Munro caused his soldiers advance to the attack; but they were received with such volleys of stones, which the Indians threw both with hands and feet, that they were repulsed in a very short time; and though the attack was renewed the next day, it was attended with no bet-

ter success; on which the English commander encamped with his army under the walls of Benares.

Soon after this, Colonel Munro being recalled, the command of the army devolved on Sir Robert Fletcher, a major in the company's troops. The nabob, in the mean time, instead of attacking the English army at once, contented himself with sending out parties of light horse to skirmish with their advanced posts, while the main body lay at the distance of about 15 miles from Benares, which rendered it very dangerous for them to move from their place. On the 14th of January 1765, however, Sir Robert ventured at midnight to break up his camp under the walls of Benares, and to march off towards the enemy, leaving a party to protect that place against any attempt during his absence. In three days he came up with the main body of Indians, who retreated before him; on which he resolved to make another attempt on Chanda Geer, before which the late commander had been foiled. His success would in all probability have been no better than that of his predecessor, had not the garrison mutinied for want of pay, and obliged the commander to surrender the place.

The reduction of Chanda Geer was followed by that of Eliabad, the capital of the enemy's country, a large city on the Ganges, between 60 and 70 miles above Chanda Geer, defended by thick and high walls and a strong fort; soon after which Sir Robert was superseded in the command of the army by Major Carnac. Sujah Dowla in the mean time had been abandoned by the Mogul, who concluded a treaty with the English soon after the battle of Buxard. He did not, however, give himself up to despair, but gathered together, with great assiduity, the remains of his routed armies; and seeing that his own territories could not supply him with the requisite number of troops, he now applied to the Mahrattas for assistance. But these people, though very formidable to the other nations of Indostan, were far from being able to cope with the English. On the 20th of May 1765, General Carnac having assembled his troops, marched immediately to attack them; and having gained a complete victory at a place called *Calpi*, obliged them to retreat with precipitation across the Yumna into their own country.

Sujah Dowla, now destitute of every resource, determined to throw himself on the clemency of the English. Previous to this, however, he allowed Meer Cossim and the assassin Somers to escape; nor could any consideration ever prevail upon him to deliver them up. Three days after the battle of Calpi, the nabob surrendered himself to General Carnac, without stipulating any thing in his own favour, farther than that he should await the determination of Lord Clive concerning him.

In the beginning of February this year died Meer Jaffier Ali Cawn, nominal nabob of Bengal. The succession was disputed betwixt his eldest surviving son Najem il Doula, a youth of about 18 years of age, and a grandson by his eldest son Miran, at that time only seven years old. As the English were in reality absolute sovereigns of the country, it was debated in the council of Calcutta whether Meer Jaffier's son should be allowed to succeed, according to the custom of the country,

country, or the grandson, according to the English custom. The point being carried in favour of Najem, it was next debated on what terms he should be admitted to the succession. The late nabob, among other impositions, had obliged himself to support an army of 12,000 horse and as many foot. It was alleged on this occasion, that he had not fulfilled his engagement; that he had disbanded most of the troops; that at best they were but an useless burden, having never answered any purpose in real service, for which reason the company had been obliged to augment their military establishment: it was therefore now judged expedient that the nabob should settle a sum, upwards of 800,000*l.* annually, on the company, to be paid out of the treasury: that he should also discard his prime minister and great favourite Nuncomar, and receive in his place a person appointed by the council, who was to act in the double capacity of minister and governor to assist and instruct him. The council were also to have a negative upon the nomination of all the superintendants and principal officers employed in collecting or receiving of the revenues; that he should take their advice, and have their consent to such nominations whenever they thought proper to interfere in them. He was also to receive their complaints, and pay a due attention to them upon the misbehaviour of any of the officers who either were appointed already or should be in time to come.

With these extravagant requisitions the young nabob was obliged to comply, though he had discernment enough to perceive that he was now an absolute slave to the council at Calcutta. Though obliged by treaty to dismiss Nuncomar from the office of prime minister, he still continued to show him the same favour, until at last he was charged with carrying on a treasonable correspondence with Sujah Dowla, for which the nabob was enjoined to send him to Calcutta to take his trial. The unfortunate prince used every method to deliver his favourite from the impending danger, but to no purpose: he was obliged to submit to the mortification of having all his offers with regard to his release rejected, though the committee at Calcutta afterwards thought proper to set him at liberty without any trial.

These extraordinary powers, exerted in such a despotical manner by the council of Calcutta for such a length of time, could not but at last induce their superiors to circumscribe them in some degree, by appointing others who should act independently even of this council, and who might be supposed to be actuated by more upright and honourable principles than had hitherto appeared in their conduct. The great character which Lord Clive had already gained in the east, justly marked him out as a proper person for adjusting the affairs of Bengal. On the 3d of May 1765 he arrived in the east, with full powers as commander in chief, president, and governor of Bengal. An unlimited power was also committed to a select committee, consisting of his lordship and four gentlemen, to act and determine every thing themselves, without dependence on the council. It was, however, recommended in their instructions, to consult the council in general as often as it could be done conveniently; but the sole power of determining in all cases was left with them, until the troubles of Bengal should be entirely ended. By these

gentlemen a plan of reformation was instantly set about; by which, however, violent disputes were occasioned: but the committee, disregarding these impotent efforts, exerted their authority to the full extent, seldom even acquainting the council with their transactions, and never allowing them to give their opinion on any occasion.

On taking the affairs of Bengal into thorough consideration, Lord Clive found that the success of the British arms could be productive of nothing but wars; that to ruin Sujah Dowla was to break down the strongest barrier which the Bengal provinces could have against the incursions of the Mahrattas and other barbarous people to the westward, who had long desolated the northern provinces; and the Mogul, with whom the company had concluded a treaty, was utterly unable to support himself, and would require the whole English power in the east to secure him in his dignity. His lordship therefore found it necessary to conclude a treaty with Sujah Dowla. The Mogul was satisfied by obtaining a more ample revenue than he had for some time enjoyed; by which means he might be enabled to march an army to Delhi to take possession of his empire. For the company his lordship obtained the office of duan or collector of revenues for the province of Bengal and its dependencies. Thus Sujah Dowla was again put in possession of his dominions, excepting a small territory which was reserved to the Mogul, and estimated at 20 lacks of rupees, or 250,000*l.* annually. The company were to pay 26 lacks of rupees, amounting to 325,000*l.* sterling. They engaged also to pay to the nabob of Bengal an annual sum of 53 lacks, or 662,500*l.* for the expences of government, and the support of his dignity. The remainder of the revenues of Bengal were allotted to the company, who on their part guaranteed the territories at that time in possession of Sujah Dowla and the Mogul.

Thus the East India company acquired the sovereignty of a territory equal in extent to the most flourishing kingdom in Europe. By all this, however, they were so far from being enriched, that the disorder of their affairs attracted the attention of government, and gave the British ministry an opportunity at last of depriving them of their territorial possessions, and subjecting the province of Bengal to the authority of the crown*. New misfortunes also speedily occurred, and the company found a most formidable enemy in Hyder Aly, or Hyder Naig. This man, from the rank of a common Sepoy, had raised himself to be one of the most considerable princes in the empire of Indostan. Being sensible that the power of the English was an insuperable bar to his ambitious designs, he practised on the nizam of the Deccan, and partly by promises, partly by threats, engaged him to renounce his alliance with the company, and even to enter into a war against them. As he had been at great pains to introduce the European discipline among his troops, and had many renegadoes in his service, he imagined, that with the advantage of numbers he should certainly be able to cope with his antagonists in the open field. In this, however, he was deceived; for on the 26th of September 1767, his army was entirely defeated by Colonel Smith at a place called *Errour* near Trincomallee; after which the nizam thought it advisable to desert his

India. new ally, and conclude another treaty with the English. From the latter, however, he did not obtain peace but at the expence of ceding to them the duanny of the Balegat Carnatic, which includes the dominions of Hyder Aly and some petty princes.

Hyder, thus deserted by his ally, transferred the seat of war to a mountainous country, where, during the year 1767, nothing decisive could be effected; while the Indian cavalry was sometimes enabled to cut off the supplies, and interrupt the communications of their antagonists. During these operations some ships were fitted out at Bombay, which conveyed 400 European soldiers and about 800 Sepoys to attack Mangalore, one of Hyder Aly's principal sea-ports, where all his ships lay. This enterprise proved successful, and nine ships were brought away; but too small a garrison having been left in the place, it was almost immediately after retaken, and all who were in it made prisoners by Hyder Aly.

117
Decline of
the Eng-
lish arms,
with the
cause of
their sad
success.

In the mean time, an injudicious measure, adopted by the English in their method of managing the army, proved not only of the utmost detriment to their cause, but occasioned disgraces hitherto unheard of in the history of the nation, viz. the desertion of officers from the service of Britain to that of a barbarous prince, and the giving up of forts in such a shameful manner as could not but suggest a suspicion that they had been betrayed.—The original cause of all this mischief was the appointment of *field-deputies* to attend the army, and to control and superintend the conduct of the commander in chief; and these, in the present instance, being deeply concerned in the contracts for the army, took care to regulate its motions in such a manner as best suited their private interest or convenience. Hyder Aly did not fail to improve the errors consequent upon this kind of management to his own advantage. General Smith had penetrated far into his country, taken several of his fortresses, and was in a fair way of becoming master of his capital, when all his operations were checked at once by the field-deputies. His antagonist being thus allowed some respite, suddenly entered the Carnatic with a numerous army of horse, ravaging and destroying every thing at pleasure. Thus the English were obliged to relinquish all their conquests in order to defend their own territories; while this reverse of fortune not only discouraged the allies of the English, but even produced in them an inclination to desert their cause, and go over to Hyder Aly, while those who remained faithful paid dearly for their attachment. The nabob of Arcot, the most faithful ally the English ever had, suffered extremely on this occasion. Hyder Aly had long entertained a violent enmity against this prince; most probably on account of his inviolable attachment to the English. His dominions were therefore ravaged without mercy; and thus, while Hyder gratified his personal resentment against him, he cut off from the English one of the principal resources they had for carrying on the war.

On the return of the company's forces to the defence of the Carnatic, they found themselves very little able to cope with their adversary; for, besides the continuance of the same causes which had formerly contributed to their want of success, they had been very much weakened in their expedition. Hyder Aly had also the prudence to avoid a general engagement,

India. but frequently intercepted the convoys of the English, cut off their detached parties, and wearied them out with long and continual marches. The news of his success against an enemy hitherto invincible by all the powers of India, so raised his reputation, that adventurers flocked to him from all parts; by which means his cavalry were soon increased to upwards of 90,000; to which, however, his infantry bore no proportion.

Notwithstanding all his success, it appears that the forces of Hyder Aly were altogether unable to cope with those of Britain, even when there was the greatest imaginable disparity of numbers. A detachment of the company's forces had made an assault upon a fort called *Mulwaggle*, in which they were repulsed with some loss. This, with the small number of the detachment, encouraged Hyder Aly to march at the head of a great part of his army to the protection of the fort. The commanding officer, however, Colonel Wood, did not hesitate, with only 460 Europeans and 2300 Sepoys, to attack his army, consisting of 14,000 horse, 12,000 men armed with matchlock guns, and six battalions of sepoy. The engagement lasted six hours; when at last Hyder Aly, notwithstanding his numbers, was obliged to retreat, leaving the field covered with dead bodies; the loss of the British being upwards of 300 killed and wounded. This engagement, however, was attended with no consequences affecting the war in general, which went on for some time in the same manner, and greatly to the disadvantage of the company. The divisions and discontents among the officers and council daily increased, the soldiers deserted, and every thing went to ruin. The revenues of the establishment of Madras being at last unequal to the expences of the war, large remittances were made from Bengal to answer that purpose; and as these were made in a kind of base gold coin, the company is said by that means alone to have lost 40,000*l.* in the difference of exchange only. At last Hyder Aly having given the English army the slip, suddenly appeared within a few miles of Madras; which occasioned such an alarm, that the presidency there were induced to enter into a negotiation with him. The Indian prince, on his part, was very ready to hearken to proposals of peace upon any reasonable terms. An offensive and defensive treaty was therefore concluded on the 3d of April 1769, on the simple condition that the forts and places taken on both sides should be restored, and each party sit down contented with their own expences.

By this treaty it was particularly stipulated, that in case of either party being attacked by their enemies, the other should give them assistance; and in this case even the number of troops to be supplied by each was specified. It soon after appeared, however, that the presidency of Madras were resolved to pay very little regard to their engagements. Hyder Aly having in a little time been involved in a war with the Mahrattas, applied for assistance, according to agreement; but was refused by the presidency, who pretended to fear a quarrel with the Mahrattas themselves. As the latter are a very powerful and warlike nation, Hyder Aly found himself overmatched, and therefore applied several times to the English for the assistance he had a right to expect; but was constantly refused on various pretences; which convinced him at last that he could place

lish.

India. no dependence on the friendship of the English, and filled him with an implacable hatred against them. As soon, therefore, as he could make up his differences with the Mahrattas, he resolved to recover his losses, and revenge himself on those faithless allies. With this view he applied himself to their rivals the French; whom no Indian nation ever found backward in supplying them with the means of defence against the English. By their means he obtained military stores in the greatest abundance, a number of experienced officers and soldiers; and the European discipline was brought to much greater perfection than even he himself had ever been able to bring it before this period. Thus, in a short time, imagining himself a match for the Mahrattas, he renewed the war; and gained such decisive advantages, as quickly obliged them to conclude an advantageous treaty with him.

121
War between the English and Mahrattas. It now appeared that the English, notwithstanding their pretended ill-will to quarrel with the Mahrattas, had not the least hesitation at doing so when their interest was concerned. In order to understand the subsequent transactions, however, we must observe, that the Mahrattas, like other nations of Indostan, were originally governed by princes called *rajahs*, who reigned at Setterah; and though in process of time they came to be divided into a number of petty states, yet they paid a nominal respect to the *ram-rajah*, who had a right to assemble their chiefs, and order out their troops on any necessary occasion. By degrees this dignity of *ram-rajah* or *sou-rajah* (as he was also called), became merely titular, the administration being entirely possessed by the *paishwa* or chancellor. This office being usurped by one particular family, Nana-row, the reigning *paishwa*, seized the *ram-rajah* and confined him in a fortress near Setterah. At his death he left two sons Mada-row and Narain-row; of whom the former, as being the elder, succeeded him in the *paishwanship*. Ionogee Boosla, or Bouncella, the immediate predecessor of Moodagee Boosla, *rajah* of Berar, was one of the pretenders to the dignity of *ram-rajah*, as being the nearest of kin; at the same time that Roganaut-row, called also Ragobah, uncle to Mada-row himself, pretended to the *paishwanship*. On this account the latter was confined by Mada-row, but who imprudently released him a little before his death, and even recommended to him in the most affectionate manner the care of his brother Narain-row, who was to succeed to the *paishwanship*. The care he took in consequence of this recommendation was such as might easily have been imagined; the unhappy Narain-row was murdered, and Roganaut-row the assassin fled to Bombay; where, on promising a cession of territory, he was protected and encouraged in his pretensions. The Mahrattas remonstrated against this behaviour; but the English had determined at all events to profit by the civil dissensions of the Indians, and therefore paid no regard to the justice or injustice of their cause. The Mahrattas therefore not only made up their differences with Hyder Aly, as has been already mentioned, but became determined enemies to the English, at the same time that a dangerous confederacy was formed among the most powerful princes of India to expel from that part of the world those intruders whose avarice could be satisfied with no concessions, and

whom no treaties could bind when it served their turn to break them.

The resentment of Hyder Aly was particularly directed against the presidency of Madras for the reasons already given; he had also received fresh provocation by their causing a body of troops march through his dominions without his leave, and that to the assistance of a prince for whom he had no great friendship; also by the capture of the French settlement of Mahie, on the coast of Malabar, which he said was within his dominions, and consequently that the French were under his protection. His troops were therefore assembled from every quarter, and the greatest preparations made for a powerful invasion. The presidency of Madras in the mean time spent their time in mutual altercations, neglecting even to secure the passes of the mountains, through which only an invasion could be made, until their active antagonist, having seized and guarded those passes, suddenly poured out through them at the head of 100,000 men, among whom was a large body of European troops under French officers, and commanded by Colonel Lally, a man of great bravery and experience in war.

The alarm was given on the 24th of July 1780 that Hyder Aly's horse were only nine miles distant from Madras. The inhabitants instantly deserted their houses and fled into the fort; while the unresisted barbarian burnt the villages, reduced the inferior forts, and prepared to lay siege to the capital. It being now absolutely necessary to make some resistance, measures were taken for assembling the troops; in doing which an express was sent to Colonel Baillie, at that time at Gumeroponda, about 28 miles from Madras, to proceed from thence directly to Conjeveram with the corps under his command, where the main body was to meet him. But when the latter was under marching orders, the first regiment of cavalry positively refused to move without money; and as they persisted in their resolution, were at last made prisoners and sent to Madras. The main body, then, consisting of 1500 Europeans and 4200 Sepoys, under Sir Hector Munro, with their train of artillery, proceeded towards Conjeveram: and such were the fatigues of their march, that 200 men belonging to the 73d regiment were left lying on the road. On their arrival at Conjeveram, they found the town in flames, great bodies of the enemy's cavalry advancing on both flanks, and no appearance of Colonel Baillie's detachment. The march of this body had been impeded by a small river swelled by a sudden fall of rain. On this occasion, the officer who gives the account of his disaster makes the following observation. "In this incident we have a most remarkable proof and example of the danger of procrastination, and on what minute circumstances and sudden springs of the mind the fortune and the general issue of war may depend. Had Colonel Baillie passed over the Tripasore without halting, as some advised, and encamped on its southern instead of its northern bank, the disaster that soon followed would have been prevented, and an order of affairs wholly different from that which took place would have succeeded."

Hyder Aly having now raised the siege of Arcot, in which he had been employed, marched towards Conjeveram; in the neighbourhood of which he encamp'd.

India. 122
Dreadful invasion by Hyder Aly.

123
Unfortunate expedition of Colonel Baillie.

India

camped, and in the course of several days, at different times, offered battle. On the 6th of September, he detached his son Tippoo Saib with the flower of his army to cut off the detachment under Colonel Baillie, who was now at Perrambaukam, a small village distant from the main body about 15 miles, he himself remaining in the neighbourhood of Conjeveram, in order to watch the motions of Sir Hector Munro.

124
He is at-
tacked by
Tippoo
Saib, but
repulses
him.

The detachment under Tippoo Saib consisted of 30,000 horse, 8000 foot, with 12 pieces of cannon. Notwithstanding this superiority in number, however, they were bravely repulsed by Colonel Baillie's handful of troops; and a junction was effected with a detachment under Sir Robert Fletcher, sent by Sir Hector Munro on first hearing the noise of the engagement.

125
Is again at-
tacked.

This junction was effected on the 9th of September, and next morning orders were given for the whole army to march; Colonel Fletcher's detachment being dispersed in different parts of the line. From the moment they began to march, the enemy played off their rockets, which, however, did but little execution; but about ten at night several guns began to open on the rear of the English. Colonel Baillie, therefore, after some proper manœuvres, caused his troops form a line, while the enemy cannonaded them incessantly with great execution. On this Colonel Baillie detached Captain Rumley with five companies of Sepoy grenadiers to storm their guns; which service they would have undoubtedly accomplished, had not their march been interrupted by a torrent of water which at that time happened to be unfordable. Captain Rumley therefore returned about half an hour after eleven, when the guns of the enemy were heard drawing off towards the English front, and a general alarm was perceived throughout their camp; owing, as was supposed, to their having received intelligence of the party that had been sent to storm their guns. "From their noise, confusion, and irregular firing (says our author), one would have imagined that a detachment of our men had fallen upon them with fixed bayonets. At that critical moment, had a party of grenadiers been sent against them, they would have routed without difficulty the whole of Tippoo's army. Having about ten o'clock in the evening advanced a few hundred yards into an avenue, the detachment remained there in perfect silence till the morning.

"Colonel Fletcher being asked by some officers, why Colonel Baillie halted? modestly answered, that Colonel Baillie was an officer of established reputation, and that he no doubt had reasons for his conduct. It cannot, however, be concealed, that this halt afforded an opportunity for Tippoo Saib to draw off his cannon to a very strong post by which the English were obliged to pass; and at the same time of informing Hyder of their situation, and suggesting to him the expediency of advancing for the improvement of so favourable a conjuncture.

"On the 10th of September, at five o'clock in the morning, our little army marched off by the right in subdivisions, having their baggage on their right flank and the enemy on their left. A few minutes after six two guns opened on their rear, on which the line halted a few minutes. Large bodies of the enemy's

India

cavalry now appeared on their right flank; and just at the moment when the pagoda of Conjeveram appeared in view, and our men had begun to indulge the hopes of a respite from toils and dangers, a rocket-boy was taken prisoner, who informed them, that Hyder's whole army was marching to the assistance of Tippoo. Four guns now opened on their left with great effect. So hot was the fire they sustained, and so heavy the loss, that Colonel Baillie ordered the whole line to quit the avenue, and present a front to the enemy; and at the same time dispatched Captain Rumley with ten companies of Sepoy grenadiers to storm the enemy's guns.

"Within a few minutes after Captain Rumley had left the line, Tippoo's guns were silenced. Rumley's little detachment immediately took possession of four of the enemy's guns, and completely routed the party attached to them. Captain Rumley, overcome with fatigue, ordered Captain Gowdie, the officer next in command, to lead on the party, and take possession of some more guns placed a few hundred yards in their front. But in a few minutes after, as they were advancing for this purpose, a sudden cry was heard among the Sepoys, of horse! horse! The camp followers, whose numbers were nearly five to one of the troops under arms, were driven on a part of our line by the numerous and surrounding forces of Hyder Aly; who being informed of the embarrassing situation of Colonel Baillie, had left his camp without striking his tents, with a view to conceal his march from the English. A great confusion among our troops was the unavoidable consequence of this sudden onset. The Europeans were suddenly left on the field of action alone: and at that critical moment a detachment from the advanced guard of Hyder's army pressed on with great celerity between our line and Captain Rumley's party. The commanding officer, therefore, apprehensive of being cut off from our little army, judged it most prudent to retreat.

126
Is attacked
by Hyder's
whole ar-
my.

"Colonel Baillie, when he was informed that an immense body of horse and infantry was marching towards him, and that this was supposed to be Hyder's main army, said, "Very well, we shall be prepared to receive them." Hyder's whole forces now appeared incontestably in view; and this barbarian chief, who, as was observed of the Roman general by Pyrrhus, had nothing barbarous in his discipline, after dividing his guns agreeably to a preconcerted plan, opened from 60 to 70 pieces of cannon, with an innumerable quantity of rockets.

"Hyder's numerous cavalry, supported by his regular infantry and European troops, driven on by threats, encouraged by promises, and led on by his most distinguished officers, bore on our little army in different quarters without making the least impression. Our men, both Europeans and Sepoys, repeatedly presented and recovered their fire-arms as if they had been manœuvring on a parade. The enemy were repulsed in every attack; numbers of their best cavalry were killed, and many more were wounded; even their infantry were forced to give way: and Hyder would have ordered a retreat, had it not been for the advice of General Lally, who informed him that it was now too late, as General Munro was most probably

127

haviour o-
the Eng-
lish.

India.

bably advancing on their rear from Conjeveram; for which reason nothing remained but to break the detachment by their artillery and cavalry.

"Tippoo Saib had by this time collected his party together, and renewed the cannonade; and at the same time that the English were under the necessity of sustaining an attack both from the father and son, two of their tumbrils were blown up by Hyder's guns, and a large opening made in both lines. They had now no other ammunition than grape; their guns discontinued firing; and in this dreadful situation, under a terrible fire not only of guns but rockets, losing great numbers of officers and men, they remained from half past seven till nine o'clock.

"On this Hyder Aly, perceiving that the guns were quite silenced, came with his whole army round their right flank. The cavalry charged them in distinct columns, and in the intervals between these the infantry poured in volleys of musquetry with dreadful effect. Mbiar Saib, with the Mogul and Sanoor cavalry, made the first impression. These were followed by the elephants and the Mysorean cavalry, which completed the overthrow of the detachment. Colonel Baillie, though grievously wounded, rallied the Europeans, and once more formed them into a square; and with this handful of men he gained an eminence, where, without ammunition, and most of the people wounded, he resisted and repulsed 13 separate attacks; but fresh bodies of cavalry continually pouring in, they were broken without giving way. Many of our men, desperately wounded, raising themselves from the ground received the enemy on their bayonets.

"Captain Lucas's battalion of Sepoys, at the time when our men moved up to a rising ground, was stationed to the right of the European grenadiers; but

India.

that corps, seeing the Europeans in motion, and misunderstanding perhaps this evolution for a retreat, broke in the utmost confusion. The Europeans, bravely sustaining their reputation for intrepid valour, remained in this extremity of distress steady and undaunted, though surrounded by the French troops, and by Hyder's cavalry to the number of 40,000. They even expressed a desire, though their number did not exceed 400, of being led on to the attack. A party of Topasses, who lay at the distance of about 30 yards in our front, kept up an incessant fire of small arms with great effect. Many attempts were made by the enemy's cavalry to break this small body of men; but by the steady conduct of both our officers and men they were repulsed.

"Colonel Baillie, finding that there was now no prospect of being relieved by General Munro, held up a flag of truce to one of the chiefs of Hyder's army. But this was treated with contempt, and the surdar endeavoured at the same time to cut off the colonel. The reason the enemy assigned for this was, that the Sepoys had fired after the signal was hoisted. A few minutes after this, our men received orders to lay down their arms, with intimation that quarter would be given. This order was scarcely complied with, when the enemy rushed in upon them in the most savage and brutal manner, sparing neither age nor infancy nor any condition of life; and, but for the humane interposition of the French commanders Lally and Pimoran, who implored and insisted with the conqueror to show mercy, the gallant remains of our little army must have fallen a sacrifice to that savage thirst of blood with which the tyrant disgraced his victory." (A)

In this unfortunate action near 700 Europeans were killed

(A) In a narrative of the sufferings of the English who survived this fatal day, said to be published by an officer in Colonel Baillie's detachment, we find it related, that "Hyder Aly, seated in a chair in his tent, enjoyed the sight of the heads of the slain, as well as of his prisoners. Colonel Baillie, who was himself very much wounded, was brought to his camp on a cannon, and with several other gentlemen in the same situation laid at the tyrant's feet on the ground and in the open air. In this situation they saw many of the heads of their countrymen presented to the conqueror, some of them even by English officers, who were forced to perform that horrid task; in a little time, however, Hyder ordered no more heads to be brought to him while the English gentlemen were present. A tent was fitted up for Colonel Baillie and his officers, but without straw or any thing else to lie upon, though many of them were dangerously wounded; and as the tent could only contain 10 persons, the rest were obliged to lie in the open air. When the prisoners were removed from place to place, they were wantonly insulted, and even beaten by those who had the charge of them. If the latter halted to refresh themselves under a tree, they would be at the trouble of carrying their prisoners to the side next to the sun, lest they should enjoy the benefit of the shade. Sometimes they were tormented with thirst, at others the people allowed them to drink water out of the palms of their hands, it being reckoned a profanation to allow an European to drink out of a vessel belonging to an Indian," &c.

In this narrative are likewise mentioned some examples of a recovery from wounds, which, if we can depend on their authenticity, must undoubtedly show a restorative power in the human body altogether unknown in this climate.

"Lieutenant Thomas Bowser received a musket ball in his leg, and after that eight desperate wounds with a scymitar. He lay for seven hours on the spot, deprived of all sensation; but, towards evening, awakened from his trance, stripped of all his clothes, except a pair of under drawers and part of his shirt, with an intense thirst, calling out, and imploring a little water from the enemy. Some were moved with compassion, while others answered his intreaties only with insults and threats of immediate death. Some water, however, was brought from a pool in the field of battle, about 50 or 60 yards from the place where he lay. It was deeply tinged with blood; nevertheless, Mr Bowser being furnished by one of Hyder's soldiers with an earthen *chatty*, or pot containing about a pint, and directed to the place, crawled thither as well as he could. Though struck with horror at the sight of the dead and wounded with which it was filled, he quenched his thirst with the liquid; and

having

India. killed on the spot; the loss on Hyder Aly's part was so great that he industriously concealed it, being enraged that the conquest of such an inconsiderable body should cost him so many of his bravest troops. He seemed ever after to consider the English with an extreme degree of terror; insomuch that, notwithstanding his pretended exultation on account of the present victory, he no sooner heard a report of Sir Hector Munro's march to attack him, that he left his camp in the utmost confusion, abandoning great part of his tents and baggage, as well as the vast numbers that had been wounded in the late action.

130
Sir Eyre Coote appointed to the command of the army.

On the news of Colonel Baillie's disaster, the supreme council of Bengal requested Sir Eyre Coote to take upon him the management of the war; for the carrying on of which a large supply of men and money was instantly decreed. This was readily undertaken by the illustrious officer just mentioned, notwithstanding his very precarious state of health at that time; and from the moment he took upon him the management of affairs, the fortune of the war was changed.

The spirit of dissension, which for a long time had infected the presidency of Madras, was indeed the true cause of all the misfortunes that had happened. This was found by Sir Eyre Coote to be even greater than he had heard by report: the respect and confidence of the natives was wholly lost; the complaints of the officers and soldiers were loud and acrimonious; an inactivity prevailed in all the councils and operations, while the enemy carried every thing before them. Sir Hector Munro had been greatly harassed on his march to Madras, whither he had retreated after Colonel Baillie's disaster; the forces of Hyder Aly had invested all the places in that neighbourhood in such a manner as in a great measure to cut off all supplies; and Arcot, the capital city of the most faithful ally the British ever had, was taken by storm, together with an adjoining fort, by which means an immense quantity of ammunition and military stores fell into the hands of the enemy.

No sooner had Sir Eyre Coote taken upon him the command of the British forces, than his antagonist thought proper to change his plan of operations entirely. He now detached large parties of his numerous forces to lay siege to the principal fortresses belonging to the company; while, with the bravest and best disciplined part, he kept the field against the British commander in person. On the very first appearance of the British army, however, his resolution fail-

ed, and he abandoned the siege of every place he had invested, retiring to a considerable distance on the other side of the river Palaar, without even disputing the passage of it, as it was expected he would have done.

A respite being thus obtained from the incursions of this formidable enemy, the next operation was to secure Pondicherry, whose inhabitants had revolted. They were, however, easily disarmed, their magazines seized, and all the boats in their possession destroyed; in consequence of which precaution, a French squadron that soon after appeared off Pondicherry was obliged to depart without being furnished with any necessaries. But in the mean time Hyder Aly having drawn large reinforcements from all parts of his dominions, resolved to try his fortune in a pitched battle. His army amounted to 200,000 men, 40,000 of whom were cavalry, and 15,000 well disciplined Sepoys. Still, however, he durst not openly attack the British army in the field, but took a strong post from whence he might harass them on their march. Sir Eyre Coote, however, was not on his part backward to make the attack; and on the other hand Hyder Aly prepared to engage him with all possible advantage. The battle was fought on the 1st of July 1781; and notwithstanding the vast superiority of Hyder Aly's army, he was routed with great slaughter. The Indians, however, made a much more obstinate resistance than usual; the engagement lasted from nine in the morning till four in the afternoon, and the deficiency of the English in cavalry prevented them from pursuing the advantage they had gained.

131
Pondicherry revolts, but is quickly reduced.

132
Defeats Hyder Aly

Notwithstanding the loss of this battle, Hyder Aly was soon encouraged to venture another. This was fought on the 27th of August the same year, on the very spot where Colonel Baillie had been defeated. It was more obstinately contested than even the former, being continued with great fury from eight in the morning to near dusk. A number of brave officers and soldiers fell on the part of the British, owing chiefly to the terrible fire of the enemy's artillery and the advantageous position of their troops. At last, however, the Indian army was totally defeated, and driven from every post it had occupied; though from the obstinate resistance made at this time, Hyder began to entertain hopes that his forces might, by a succession of such battles, be at last enabled to cope with the English. He therefore ventured a third battle in some weeks after, but was now defeated with greater loss

133
Gains a second victory.

134
Hyder defeated a third time.

having filled his chatty, endeavoured to proceed towards Conjeveram. He had not, however, moved from his place above 300 or 400 yards, when, being quite overcome, he was obliged to lie all night in the open air, during which time there fell two heavy showers of rain. Next morning he proceeded to Conjeveram; but after walking about a mile, was met by some of the enemy's horsemen, by whom he was brought back prisoner, and obliged to walk without any assistance. When delivered up to the enemy's Sepoys, he was so stiff with his wounds, that he could not stoop or even bend his body in the smallest degree.

"The quarter-master serjeant of artillery received so deep a cut across the back part of his neck, that he was obliged to support his head with his hands in order to keep it from falling to a side all the journey. The least shake or unevenness of the ground made him cry out with pain. He once and again ceased from all attempts to proceed; but being encouraged and conjoined by his companions to renew his efforts, he did so, reached the camp, and at last, as well as Mr Bowler, recovered."—It is also remarkable, that, according to our author, out of 32 wounded persons only six died; though one would be apt to think that the excessively severe usage they met with would have killed every one.

^{India.} Iols than before. Undiscouraged by this bad success, however, he laid siege to Vellore; and expecting that the relief of it would be attempted, seized a strong pass through which he knew the British army must direct their march. The British commander accordingly advanced, and found the enemy in possession of some very strong grounds on both sides of a marsh through which he was obliged to pass. Here he was attacked on all sides, but principally on the rear, the enemy directing their force principally against the baggage and convoy of provisions designed for the garrison. Their utmost efforts, however, were unsuccessful, and Sir Eyre Coote forced his way to Vellore in spite of all opposition. Hyder Aly did not fail to wait his return through the same pass; and having exerted his utmost skill in posting his troops, attacked him with the utmost vigour: but though the English were assaulted in front and in both flanks at once, and a heavy cannonade kept up during the whole time of the engagement, the Indians were at last defeated with great slaughter.

Dutch set-
tlement of
Negapatam
reduced.

¹³⁷
and like-
wise Trin-
comale.

By these successes the presidency of Madras were now allowed so much respite, that an enterprise was planned against the Dutch settlement of Negapatam, situated to the south of Madras, and in the neighbourhood of Tanjour. A very inconsiderable force, however, could yet be spared for this purpose, as Hyder Aly, though so often defeated, was still extremely formidable. Sir Hector Munro had the management of the expedition: and so furious was the attack of the British sailors, that the troops left to guard the avenues to the place were defeated at the very first onset. A regular siege ensued; which, however, was of very short duration, a breach being soon made and the garrison surrendering prisoners of war.

The loss of Negapatam was quickly followed by that of Trincomale in Ceylon. Admiral Hughes, who had conveyed Sir Hector Munro with the land forces to that place, and assisted him with his sailors, immediately after its surrender set sail for Trincomale, where he arrived about the middle of January 1782. The fort of that name was quickly reduced; but the main strength of the settlement consisted of a fort named *Ossenburgh*, the principal place on the island, and by the capture of which the whole settlement would be reduced. This fort stands on a hill which commands the harbour, but is itself overlooked by another hill at the distance of no more than 200 yards. Though the gaining of this post was undoubtedly to be attended with the loss of the fort, it does not appear that the governor even attempted to defend it. A British detachment of sailors and marines therefore took possession of it, when the admiral sent a summons of surrender, representing the inutility of making any farther defence after the loss of such a post; and being extremely desirous of avoiding an effusion of blood, repeated his arguments at several different times. The governor, however, proving obstinate, the place was taken by storm, with the loss of about 60 on the part of the British, and very little on that of the Dutch, the victors giving quarter the moment it was asked. Four hundred Europeans were taken prisoners; a large quantity of ammunition and military stores, with a numerous artillery, were found in the place; and two Indianmen

richly laden, with a number of small trading vessels, ^{India} were taken in the harbour.

A more formidable enemy, however, now made his appearance on the coast of Coromandel. This was ¹³⁸ Suffrein the French admiral; who setting out from his native country with 11 ships of the line and several stout frigates, had fallen in with the Hannibal of 50 guns, and taken her when separated from her consort. This ship, along with three others, a 74, a 64, and a 50, had been sent out to the assistance of Sir Edward; and the three last had the good fortune to join him before the arrival of M. de Suffrein. The latter, supposing that he had not yet received this reinforcement, bore down upon the English squadron at Madras, to which place they had sailed immediately after the capture of Trincomale. Perceiving his mistake, however, he instantly bore away. The English admiral pursued, took six vessels, five of them English prizes, and the sixth a valuable transport laden with gunpowder and other military stores, besides having on board a number of land-officers and about 300 regular troops. This brought on an engagement, in which M. Suffrein, perceiving the rear division of the British fleet unable to keep up with the rest, directed his force principally against it. The ships of Admiral Hughes ¹³⁹ himself and Commodore King sustained the most violent efforts of the French, having mostly two, and sometimes three, vessels to contend with. Thus the commodore's ship was reduced almost to a wreck; but <sup>Engage-
ment be-
tween h.m.
and Sir
Edward
Hughes.</sup> about six in the evening, the wind becoming more favourable to the English, the squadron of the enemy were obliged to draw off. The loss of men on the part of the British amounted to little more than 130 killed and wounded, but that of the French exceeded 250.

After the battle Sir Edward returned to Madras; but meeting with no intelligence of Suffrein at that place, he made the best of his way for Trincomale, being apprehensive of an attack upon that place, or of the intercepting of a convoy of stores and reinforcements at that time expected from England. Suffrein had indeed got intelligence of this convoy, and was at that time on his way to intercept it. This brought the hostile fleets again in sight of each other; and as the British admiral had been reinforced by two ships of the line, he was now better able to encounter his adversary. A desperate battle ensued, which continued till towards night, when the ships on both sides were so much shattered, that neither could renew the engagement next day.

Though these engagements produced nothing decisive, they were nevertheless of the utmost prejudice to the affairs of Hyder Aly, who was thus prevented from receiving the succours he had been promised from France; and he was still farther mortified by the defeat of his forces before Tellicherry, which place he had blocked up since the commencement of hostilities. ¹⁴⁰ This last misfortune was the more sensibly felt, as an open passage was now left for the English into those countries best affected to Hyder. His bad success here, however, was in some measure compensated by the entire defeat of a detachment of about 2000 English infantry and 300 cavalry under Colonel Braithwaite, a brave and experienced officer. This detach- <sup>Hyder

India. ment, consisting of chosen troops from Sir Eyre Coote's army, lay encamped on the banks of the Coleroon, which forms the northern boundary of Tanjour. Tippoo Saib having procured exact intelligence of the situation of this party, formed a design of attacking it while no danger was suspected on account of the distance of Hyder Aly's army. He set out on his design with an army of 15,000 horse and 5000 foot, accompanied by a body of French regulars; and having crossed the Coleroon, suddenly surrounded the British forces on all sides. The colonel, perceiving his danger, formed his men into a square, distributing the artillery to the several fronts, and keeping his cavalry in the centre. In this situation he resisted for three days the utmost efforts of his numerous enemies, always compelling them to retreat with great loss. At last General Lally, rightly conjecturing that the strength of the English must be exhausted and their numbers thinned by such desperate service, proposed that the French infantry, which was fresh and entire, should attack one of the fronts of the square, while the forces of Tippoo should do the same with the other three. This last attack proved successful; the British forces were broken with great slaughter, which however was stopped by the humanity of the French commander; who even obtained from Tippoo Saib the care of the prisoners, and treated them with a tenderness and humanity they certainly would not otherwise have experienced. A number of British officers, however, perished in the engagement, and only one remained unwounded.

143
Cuddalore
taken.

In the mean time, the succours from France, so long expected by Hyder, made their appearance. As soon as a junction was formed, they proceeded, under the command of M. Duchemin, to invest Cuddalore; which not being in any situation to stand a siege, was surrendered on capitulation. In like manner some other places of smaller consequence were reduced, until at last being joined by Hyder's numerous forces, they determined to lay siege to Vandervath, a place of great importance, and the loss of which would have been extremely detrimental to the English. This quickly brought Sir Eyre Coote with his army to its relief; but Hyder Aly, notwithstanding his being reinforced by the French, durst not yet venture a battle in the open field. On this the British commander proceeded to attack Arnee, the principal depository of Hyder's warlike stores and necessaries. Thus the latter was obliged to quit his advantageous ground; but he did so with such secrecy and speed, that he came upon the British army unawares while preparing for its last march to Arnee, now only five miles distant. Perceiving that the march of the British troops was through low grounds, encompassed on most parts with high hills, he planted his cannon upon the latter; from which he kept a continual and heavy fire on the troops below, while his numerous cavalry attacked them on every side. Notwithstanding all disadvantages, the British commander at last closed in with the enemy; and after an obstinate dispute completely routed them. Neither this, however, nor any other engagement with Hyder Aly, ever proved decisive; for as the want of cavalry prevented the British general from pursuing his advantage, so that of his antagonist was so numerous, that by it he always covered his retreats in such

144
Hyder Aly
defeated a
fifth time
by Sir Eyre
Coote.

an effectual manner as to lose but few men, and in a short time to be in a condition to act again on the offensive. This was remarkably the case at present; for notwithstanding this defeat, which happened on the 2d of June 1782, he cut off an advanced body of the British army five days after; and harassed the whole in such a manner, that Sir Eyre Coote, notwithstanding his success, was obliged to move nearer Madras; soon after which, he was obliged, on account of his bad state of health, to relinquish the command of the army to General Stuart.

Hyder Aly now perceiving that he was likely to be attended with no success by land, began to rest his hopes on the success of the French by sea. He therefore earnestly requested M. Suffrein, who possessed at that time a decisive superiority in the number of ships, to lose no time in attacking the British squadron before it could be joined by a reinforcement which was then on its way, and was reported to be very formidable. As the French commander was by no means deficient in courage, a third engagement took place on the 5th of July 1783. At this time the British had the advantage of the wind, the battle was much more close, and the victory more plainly on their side. It is said indeed, that had not the wind fortunately shifted in such a manner as to enable the French to disengage their ships, a total and ruinous defeat would have ensued. After the engagement, the French admiral proceeded to Cuddalore, having received intelligence that a large body of French troops in transports had arrived off the island of Ceylon, in company with three ships of the line. As this seemed to afford hopes of retaliation, he used such diligence in refitting his ships, that the fleet was able to put to sea in the beginning of August. His intention was to make an attempt on Trincomale; and so well were his designs conducted, that Sir Edward received no intelligence of the danger, till a British frigate chasing a French one, which took shelter with the squadron at Trincomale, discovered it by this accident, and hastened back with the news to Madras. It was now, however, too late; the place was not in a condition to resist a siege; and the French batteries having silenced those of the fort in two days, a capitulation took place on the last day of August.

145
A third sea
fight, great-
ly to the di-
advantage
of the
French.

Sir Edward Hughes having been detained by contrary winds, did not arrive at Trincomale before the 2d of September, when he had the mortification to see the forts in the hands of the French, and that Suffrein was in the harbour with 15 sail of the line while he had only 12. He did not hesitate at venturing an engagement with this inferiority, nor did M. Suffrein decline the combat. The event of the battle was no other than shattering the fleets and killing and wounding a number of men on both sides. In this, however, as well as in the other engagements, the superiority of the English was very manifest; and in entering the harbour of Trincomale the French lost a 74 gun ship.

146
Who ne-
vertheless
take Tri-
comale.

The loss of Trincomale was severely felt by the English; for while the French lay safely in the harbour refitting their squadron, the English were obliged for that purpose to sail to Madras. Here the fleet was assailed by one of the most dreadful tempests ever known on that coast. Trading vessels to the number

India: of near 100 were wrecked, as well as those for Madras laden with rice, of which there was an extreme scarcity at that place. Thus the scarcity was augmented to a famine, which carried off vast numbers of the inhabitants before supplies could arrive from Bengal. The continuance of the bad weather obliged Sir Edward with his whole squadron to sail to Bombay; and there he did not arrive till towards the end of the year, when his squadron was so much shattered, that, in order to repair it with proper expedition, he was obliged to distribute it between the dock-yards of Bombay and the Portuguese settlement at Goa.

In the mean time Sir Richard Bickerton arrived at Bombay from England with five men of war, having on board 5000 troops, after a very favourable passage; having neither seen nor heard of the bad weather which had desolated the coasts of India. It was likewise the intention of France to signalize the campaign of this year by an immense force both by sea and land in India. Exclusive of the forces already on the coast of Comorandel, they were to be joined by 5000 more, all regulars, from their islands on the African coast. Suffrein was to be reinforced by several ships of the line, when it was hoped that a decided superiority at sea would be obtained over the English; while their superior numbers and artillery on shore would render them invincible by any force that could be brought against them. To oppose these designs, it was deemed necessary by the presidency of Bombay to make a powerful diversion on the coast of Malabar. Here was situated the kingdom of Mysore, the sovereignty of which had been usurped by Hyder Aly under the title of *Darwa*, as that of the Mahrattas was by a person styled *Paiswa*. This kingdom is nearly in the same parallel with Arcot. To the northward is the kingdom of Canara, which is said to have been the favourite possession of Hyder Aly; the name of its capital is Bidnore, which also gives name to an extensive territory, and was by Hyder changed to that of Hydernagur. The expedition had been set on foot as early as the end of the year 1781; a strong body of forces under the command of Colonel Humberstone had taken the two cities of Calicut and Panyan, besides others of lesser note, and penetrated into the inland country, which is there difficult and dangerous. Having here made himself master of a place called *Mongarry Cotta*, of which the situation commanded the entrance into the inner parts of the country, he proceeded to attack Palatacherry, a considerable town at some miles distance; but being suddenly environed with a numerous and hostile army, instead of making himself master of the place, it was not without the utmost difficulty that he made his escape after losing all his provisions and baggage. A great army, consisting of 20,000 foot and 10,000 horse, under Tippoo Saib, also advanced against him with such celerity, that the colonel had only time to retreat to Panyan, where he was superseded in the command by Colonel Macleod; and soon after the place was invested by the forces of the enemy, among whom was General Lally with a considerable body of French. Two British frigates, however, having come to the assistance of the place, rendered all the attempts of the enemy to reduce it abortive. At last Tippoo Saib, impatient of delay, made a vigorous effort against the British lines; but though both the Indian and

French commanders behaved with great bravery, the attack not only proved unsuccessful, but they were repulsed with such loss as determined Tippoo to abandon the siege of the place, and retire beyond the river of Panyan.

As soon as the presidency of Bombay were acquainted with the success of Colonel Humberstone, General Matthews was dispatched to his assistance with a powerful reinforcement. This expedition, which began the campaign of 1783 in the kingdom of Canara, has been related with circumstances so disgraceful, and so exceedingly contrary to the behaviour for which the British troops are remarkable, that we are totally at a loss to account for them. On the one hand, it seems surprising how the national character could be forfeited by a particular body, and not by any other part of the army; and on the other, it seems equally surprising why such calumnies (if we suppose them to be so) should have arisen against this particular body and no other part of the army. Such accounts of it, however, were published as raised the indignation of the military gentlemen, who thought proper to publish a vindication of themselves. In the Annual Registers, from whence, next to the gazettes and newspapers, the general-ity receive what they look upon to be authentic intelligence, the character of this army is treated with the highest asperity. "In the story of the conquest and recovery of Canara (says the New Annual Register), the Spaniards may be said to be brought a second time upon the scene, but not to sit down in sullen and insolent prosperity after all their crimes. The Spaniards of Britain were overtaken in the midst of their career; and he who is more of a man than an Englishman, will rejoice in the irregular and unmeasured, but at the same time the just and merited, vengeance that was inflicted upon them by the prince whose dominions they were ravaging!" In support of this dreadful exclamation the following account is given of the expedition. It began with the putting in execution a design formed by General Matthews of carrying the war into the heart of Hyder Aly's dominions. For this purpose the English invested the city of Onore, situated about 300 miles to the south of Bombay, and one of the principal places in the country of Canara. "It was taken by assault (says Dr Andrews) with great slaughter, and plundered with circumstances of avarice and rapine that disgraced the victors; among whom, at the same time, great discontents arose concerning the division of the spoil." "No quarter (says the Annual Register) was given by the victorious English; every man they met was put to the sword. Upon this occasion we beg leave to transcribe three lines from the private letter of one of the officers concerned in the expedition. 'The carnage (says he) was great: we trampled thick on the bodies that were strewed in the way. It was rather shocking to humanity; but such are only secondary considerations, and to a soldier, whose bosom glows with heroic glory, they are thought only accidents of course; his zeal makes him aspire after farther victory.' This part of the peninsula had hitherto been untouched by the barbarous and unsparing hands of Europeans, and of consequence was full of riches and splendor. In the fortrefs of Onore were found sums of money to an unknown amount, besides jewels and diamonds,

India.

diamonds. A considerable part of this appears to have been secured as private plunder by General Matthews. The complaints of the military were loud; they thought, and naturally, that the acquisition of riches was the fair and reasonable consequence of the perpetration of bloodshed. But their commander turned a deaf ear to their representations; and hastened, by adding new laurels to his fame, to hide the slander that might otherwise rest upon him."

From Onore the army proceeded to the nearest fortresses on the sea coast, More and Cundapour. Here they were joined by a reinforcement from Bombay under the command of Colonels Macleod and Humberstone, with positive orders to proceed for Bidnore or Hydernagar the capital of Canara. On this General Matthews marched for the mountains called the *Ghauts*, where there is a pass three miles in length, though only eight feet wide, and which was then strongly fortified and defended by a vast number of the natives. "The English (say our authors), however, had already obtained a considerable reputation by their executions; and the use of the bayonet, the most fatal instrument of war, and which was employed by them on all occasions, created such an extreme terror in the enemy, as to enable them to surmount this otherwise impregnable defile."

The gaining of this pass laid open the way to Bidnore the capital, to which a summons was now sent. An answer was returned, that the place was ready to submit, provided the inhabitants were not molested, and the governor was permitted to secure his property. The wealth of this city was undoubtedly great, but the estimates of its amount are very different. By the accounts of Bombay it was stated only at 175,000*l.* while the officers concerned in the expedition say that it was not less than 1,200,000*l.* or even 1,920,000*l.*; and even this was only public property; that seized upon by the soldiers, and which belonged to private persons, was undoubtedly very considerable also.

This treasure was at first shown by the general to his officers, and declared to belong to the army; but he afterwards told them that it was all the property of the Mohammedan governor, and had been secured to him by the terms of the surrender. It was therefore sent to Candapour under the convoy of Lieutenant Matthews, brother to the general, to be thence transmitted to Bombay; but whether any part of it ever reached that settlement or not was never known. The discontents of the army were now carried to the utmost height; and the contest became so serious, that Colonels Macleod, Humberstone, and Shaw, quitted the service altogether, and returned to Bombay. The officers charged their general with the most insatiable and shameful avarice; while he, in return, accused his whole army of doing every thing disrespectful and injurious to him; of paying no regard to order and discipline, and of becoming loose and unfeeling as the most licentious freebooters.

From Bidnore detachments were sent to reduce several fortresses, the principal of which was Ananpour or Anantpore. Here orders were issued for a storm and no quarter. Every man in the place was put to death, except one horseman who made his escape after being wounded in three places. "The women, unwilling to be separated from their relations, or expo-

India.

fed to the brutal licentiousness of the soldiery, threw themselves in multitudes into the moats with which the fort was surrounded. Four hundred beautiful women, pierced with the bayonet, and expiring in one another's arms, were in this situation treated by the British with every kind of outrage."

This exploit was succeeded by the reduction of Carwa and Mangalore, which completed the reduction of Canara, when General Matthews put his army in cantonments for the rainy season.

This rapid success was owing to the death of Hyder Aly, which happened in the end of the year 1782. His son Tippoo Saib, however, having taken possession of the government, and settled his affairs as well as time would allow, instantly resumed his military operations. On the 7th of April 1783 he made his appearance before Bidnore, so that General Matthews had scarce time to collect a force of 2000 men, and to write to Bombay for a reinforcement. But, however necessary the latter must have been in his circumstances, the presidency were so much prejudiced against him by the unfavourable reports of his officers, that they suspended him from his commission, appointing Colonel Macleod to succeed to the command of the army.

Tippoo Saib now advanced with a vast army, supposed not to be fewer than 150,000 men, covering the hills on each side of the metropolis as far as the eye could reach. The army of General Matthews, altogether unable to cope with such a force, was quickly driven from the town, and forced to take refuge in the citadel. Tippoo having cut off their retreat by gaining possession of the Ghauts, laid close siege to the fortress; which in less than a fortnight was obliged to capitulate. The terms proposed were, that all public property should remain in the fort; that the English should engage not to act against Tippoo for a stipulated time; that they should march out with the honours of war; that they should pile their arms, and have full liberty to proceed unmolested with their private property to the sea-coast, from thence to embark for Bombay; and in this capitulation the garrisons of Ananpour and other inland fortresses were also included.

All these terms were broken by Tippoo, who said that they had forfeited their title to liberty by a breach of the articles of capitulation, in embezzling and secreting the public money, which was all, in good faith, to be delivered up. That this was really the case seems to be universally acknowledged. In the Annual Register we are told, that "to prevent too much money being found in the possession of one man, the general ordered his officers to draw on the paymaster-general for whatever sums they wanted. When the fort was surrendered to the sultan, there was not a single rupee found in it." By this circumstance the fate of the garrison was decided. General Matthews was sent for next morning to a conference. He was not, however, admitted to his presence, but immediately thrown into chains. Most of the other principal officers were, on various pretences, separated from the army. The general and his companions were conducted to Seringapatam the capital of Myfore; and after having experienced a variety of severities, were at last put to death by poison. In this manner the general and 20 officers perished.

India. perished. The poison administered was the milk of the cocoa-tree, which is said to be very deadly.

The above account was repeatedly complained of as partial; and at last openly contradicted in a pamphlet entitled "A Vindication of the Conduct of the English Forces" employed in that expedition, and published by order of the East India Company. In this pamphlet the circumstance most found fault with was that regarding the women at Anantpore, which was positively contradicted. On this account, therefore, the publishers of the above-mentioned work retract that part of their narrative, as being founded in misrepresentation. Notwithstanding this vindication, however, they still draw the following conclusions. "It is already sufficiently evident, how little has been effected by this vindication of the Bombay officers. The great outlines of the expedition remain unaltered. It is still true that a remarkable degree of severity was employed in the field; that, in the capture of the fortresses of Canara, the principle of a storm and no quarter was very frequently applied; and that the acquisition of money was too much the governing object in every stage of the undertaking. The vindication of the officers has therefore done them little service; and it happens here, as it generally does in the case of an imperfect reply, that the majority of the facts are rather strengthened and demonstrated by the attempt to refute them. With respect to the conclusion of the story, the treasures of Hydernagur, and the charge brought against them by Tipoo, that they had broken the terms of the capitulation, and that when the fort was surrendered not a rupee was to be found in it; these circumstances are passed over by the officers in the profoundest silence. It was this that roused the sultan to vengeance; and it is to this that he appeals for his justification in disregarding a capitulation which had been first dissolved by the vanquished English."

The vindication above alluded to was signed by one major and 52 subaltern officers. It seems not, however, to have given entire satisfaction to the military gentlemen themselves, as other vindications have appeared, said to be written by officers; but these being anonymous, can be supposed to add very little weight to that already mentioned, where such a respectable body have signed their names. We shall therefore drop a subject so disagreeable, and the investigation of which at the same time is entirely foreign to the plan of this work.

It now remains to give some account of the war with the Mahrattas, begun, as was formerly hinted, on account of the protection afforded to the assassin Roganaut-row. This man had formerly obliged the Mogul to take shelter in the English factory at Bengal; but being unable to keep up his credit among his countrymen, was expelled as already related. On his arrival at Bombay, an alliance was formed betwixt him and the English government; by which the latter engaged to replace him in the Mahratta regency in consideration of some valuable cessions of territory. The supreme council of Bengal, however, disowned this treaty, and concluded one with the Mahrattas in the month of March 1776; by which it was agreed that they should provide for Ragobah's subsistence according to his rank, on condition of his residing in their country.

This being not at all agreeable to Ragobah, he fled once more to Bombay, where a new confederacy was entered into for his restoration. The council of Bengal approved of this on account of the approaching rupture with France; and in consequence of this, a detachment was, in February 1778, ordered to march across the continent of India. By some mismanagement in this expedition, the whole army was obliged to capitulate with the Mahratta general on the 9th of January 1779. One of the terms of the capitulation was, that a body of troops which were advancing on the other side should be obliged to return to Bengal. But General Goddard, the commander of these forces, denying the right of the council of Bengal to remand him, proceeded on his march, and arrived on the 18th of February. Here he received orders to conclude a new treaty, if it could be obtained on easier terms than that of the capitulation, by which it had been engaged to cede all our acquisitions in the country of the Mahrattas.

Such extreme disregard to any stipulations that could be made, undoubtedly provoked the Mahrattas, and induced them to join in the confederacy with Hyder Aly already mentioned. The war, however, was successfully begun by General Goddard in January 1780. In three months he reduced the whole province of Guzerat. Madajee Scindia the Mahratta general advanced to oppose him; but as he did not choose to venture a battle, the English general stormed his camp, and totally routed him. Other exploits were performed in the course of this campaign; during which the governor-general (Mr Hastings) seeing no hopes of an accommodation, entered into a treaty with the rajah of Godhud, and with his consent Major Popham reduced a fortress in his dominions named *Guallior*, garrisoned by the Mahrattas, and hitherto reckoned impregnable.

These successes were followed by the dreadful incursions of Hyder Aly already related, which put a stop to the conquests of General Goddard; all the forces he could spare being required to assist the army under Sir Eyre Coote. The last exploit of General Goddard was the reduction of the island of Salfette, and of a strong fortress named *Bassein* in its neighbourhood. The army of Scindia, consisting of 30,000 men, was also defeated this year by Colonel Carnac; and the Mahrattas, disheartened by their losses, consented to a separate peace with the English, leaving Hyder Aly to manage the war as he thought proper.

In the mean time, however, the expences incurred by these wars were so high, that Mr Hastings, who was obliged to furnish them some how or other, was reduced to the greatest difficulties. For this purpose not only all the treasure of Bengal was exhausted, but it was found necessary to draw extraordinary contributions from the British allies, which was productive of many disagreeable circumstances. One of the most remarkable was the revolt of Benares. The rajah of this country had formerly put himself under the protection of the English, who on their part agreed to secure his dominions to him on condition of his paying an annual subsidy to the nabob of Oude. In 1770 the rajah died, and was succeeded by his son Cheit Sing, who held the sovereignty at the time we speak of. On the death of the nabob in 1775, a new treaty was made with his successor,

war.153
Revolt of
Benares.

India. successor, by which the sovereignty of Benares was transferred to the East India Company, an acquisition equivalent to 240,000l. per annum; at the same time that the subsidy paid by Sujah Dowla, and which, by Lord Clive, had been fixed at 36,000l. and afterwards raised to 252,000l. was now augmented to 312,000l. per annum.

On receiving intelligence in July 1778, that war had actually commenced between France and England, Cheit Sing was required to pay 50,000l. as his share of the public burdens. Such a demand was paid with extreme reluctance on the part of a prince who already contributed 240,000l. and probably thought that an abundant equivalent for the protection enjoyed. The same requisition, however, was made the two succeeding years, but with a promise that the demand should cease when peace was restored. Instead of any present alleviation, however, a body of troops was also quartered upon him, and he was likewise obliged to pay for their maintenance, lest he should not voluntarily pay the additional 50,000l. In November 1780, in addition to all these demands, he was also required to send into the field such a body of horse as he could spare; but this requisition, owing to some misunderstanding, was never complied with.

154
Cheit Sing
arrested
and depo-
sited.

In July 1781 Mr Hastings having, it is said, received some intelligence that the oppressed rajah meditated rebellion, set out on a visit to the nabob of Oude, and in his way proposed to clear up the misunderstanding with him. The method by which he intended to clear up this misunderstanding was to lay a fine upon the poor prince of 400,000l. or 500,000l.; and as a reason for doing so, it was alleged that the late rajah had left a million sterling in his treasury; a sum which was continually increasing. Cheit Sing advanced to the borders of his territories to meet the governor general, behaved with all imaginable submission; and having got private intelligence of what was meditated against him, offered to pay down 200,000l. This was refused; and the governor-general having reached the capital, forbade the rajah his presence, and by a letter acquainted him with his causes of complaint. Cheit Sing sent a very submissive answer; but as he endeavoured to exculpate himself, Mr Hastings was so far from being satisfied, that he put the prince under an arrest.

Such an unheard-of proceeding excited the utmost surprise and resentment in subjects accustomed to regard their sovereign with a degree of reverence little short of adoration. On the very day of the arrest they assembled tumultuously, cut in pieces the guard which had been set on the palace, and carried off their prince in triumph. It does not appear, however, that this was any other than a transitory tumult; for though they could easily have cut off the governor-general, they made no attempt against him. Cheit Sing protested his innocence, and made the most unlimited offers of submission, but all in vain. His government was declared vacant, and the zemindary bestowed on the next heir; the annual subsidy to the government of Bengal was augmented from 240,000l. to 300,000l. annually. The miserable rajah was forced to fly his country; and his mother, though promised leave to retire upon conditions, was attacked in her retreat and plundered by the soldiers. After all his endeavours to procure money, however, Mr Hastings found this adventure turn out

much less profitable than he had expected; for the treasury of the fugitive prince was seized and retained by the soldiery.

As to the nabob of Oude, a new treaty was concluded with him; the design of which was evidently to ease him of some of the burdens to which he was at that time subjected. Part of the British troops were therefore withdrawn from his dominions. As Fizulla Khan, the most prosperous of his dependents, had been called upon to furnish a body of 5000 horse to join the nabob's army, and had not complied with the requisition, the guarantee of his treaty with the nabob, formerly executed, was withdrawn; but it being afterwards discovered that his territory was not equivalent to the claims of the governor, the treaty was renewed on payment of a slight fine. As the widow of Sujah Dowla was suspected of favouring the late rajah Cheit Sing, the reigning prince was allowed to reclaim the treasures of his father in her possession, on condition of paying her a certain stipulated allowance annually. The treasures were seized as payment of the debts of the prince to the company.

India.
155
New treaties with the nabob of Oude.

Hostilities continued in India between the French and English till the year 1783 was far advanced, and long after tranquillity had been restored to other parts of the world. In the beginning of the season for action the governor and council of Bengal determined to send an ample supply to the presidency of Madras, that they might be enabled to put an end to the war, which Tippoo seemed willing to prosecute with even more vigour than his father had done. For this purpose Sir Eyre Coote, who, for his health, had gone to Bengal by sea, set sail once more for Madras, being intrusted with a large sum of money for the necessary expences of the war. In his passage he was chased for forty-eight hours by two French men of war. The solicitude and fatigue he underwent during this time, being almost constantly upon deck, occasioned a relapse, so that he died in two days after his arrival at Madras. His death was greatly lamented, as the greatest expectations had been formed of a happy conclusion being put to the war by his extraordinary military talents, for which he had already acquired so great a reputation in India.

The invasion of Tippoo's dominions having called him off from the Carnatic, General Stuart took the opportunity of attacking him in another quarter. Colonel Fullarton was despatched with a large body of troops to invade the province of Coimbatour. This he executed with great success; overrunning the country, taking several fortresses, and making a very alarming diversion on this side of Tippoo's dominions. General Stuart, however, having still greater designs in view, was obliged to recal this gentleman in the midst of his success. The siege of the strong fortress of Cuddalore was the operation which now engaged his attention. It was now become the principal place of arms belonging to the French; was strongly fortified, and garrisoned by a numerous body of the best troops in France, as well as a considerable number of Tippoo's choicest forces. The siege therefore proved so difficult, that though the English displayed the utmost valour and military skill, they were not able to reduce the place until hostilities were interrupted by the news of a general pacification having taken place in Europe. In

156
Cuddalore
successfully besieged by the English.

Indi. this siege a remarkable circumstance took place, viz. that of a corps of Sepoy grenadiers encountering and overcoming the French troops opposed to them with fixed bayonets. For this remarkable instance of valour, they not only received the highest applause at the time, but provision was made for themselves and families by the presidencies to which they belonged.

After the reduction of Hydernagur, and the destruction of the army under General Matthews, the English possessed only three places of consequence in the kingdom of Canara. These were Mangalore, Onore, and Carwa. The siege of all these places was undertaken at once. Mangalore, the principal port in the country, was defended by a very numerous garrison under Major Campbell. Tippoo sat down before it on the 19th of May; and the attack and defence were both conducted with the greatest spirit and activity. Notwithstanding the utmost efforts of the besiegers, however, and that the garrison were reduced to the last extremity for want of provisions, they held out in spite of every difficulty, until the general pacification being concluded, the place was afterwards delivered up. In other parts nothing more happened than an indecisive engagement between M. Suffrein and Admiral Hughes; so that the British empire in Bengal was for that time fully established, and continued unmolested by foreign enemies, till the ambition of Tippoo Saib again prompted him to invade the territories of the nabob, an ally of Britain. This again brought on a war with that restless, but able prince; in this war the British were joined by the Mahrattas, and the conduct of it was entrusted to Lord Cornwallis.

157
Character
of Hyder
Aly.
Among the various usurpers who suddenly rose to the rank of sovereign princes on the fall of the Mogul empire, Hyder Aly was the most successful. A raaster in dissimulation and treachery, he laboured, while in a humble station, to acquire the confidence of his superiors, that he might the more completely betray them. These qualities, so necessary to a successful usurper, were in time accompanied with considerable military skill, and great talents for government. Hence the power which he at first so treacherously obtained, was soon augmented by fresh acquisitions; and the territories which he conquered were governed with a systematic arrangement and rigorous justice, which speedily augmented their population, and increased his own resources.

158
and of Tip-
poo Sultan.
His son, Tippoo Sultan, though far inferior to his father in the art of government, in moderation, and in the general steadiness of his character, was, however, distinguished in India as an excellent officer and intrepid warrior; qualities which effectually secured him the confidence of his troops. The operation of the system established by his father, and the warlike complexion of his own character, continued to support the general prosperity of his dominions, which were enlarged on all sides by conquests from his neighbours, and were strengthened by a great number of the most impregnable fortresses in the peninsula.

Hence the power of the Mysorean kings, which in its rise had been often combated, and sometimes defeated by the Mahrattas, at last acquired a decided ascendancy in the south of India. The discipline and fidelity of their troops, till their late aggressions on the British, had constantly been increasing in reputation;

Indi. and fully evinced the excellent regulations which had been established for the army. The government of both princes was strict; that of the last, violent and arbitrary. It was still, however, the despotism of an able and warlike sovereign, who may rigorously check, but does not destroy those subjects which must form the means of his future aggrandisement.

From these causes the extensive territory of the Mysore and its dependencies had not, in the course of many years, suffered materially, either from insurrection or external invasion;—a felicity but rarely experienced in any quarter of India. When they were invaded by the British and their allies, under the conduct of Lord Cornwallis, the whole country was found in a high state of cultivation, and filled with inhabitants. The regular army consisted of 70,000 men; and the troops employed in the garrisons, in the police, and in the collection of revenue, amounted, by the most authentic accounts, to twice that number. This vast establishment was so completely furnished with artillery in the numerous forts, and in the field, that upwards of 400 cannon were found in the outworks of the capital alone. The most frequent bar to the efficiency of native armies, is the want of regular pay: an obstacle the provident sultan had removed, by gradually amassing vast treasures, which he secured in the forts, or in the capital; and by improving his revenue, which amounted annually to upwards of three millions sterling.

The power and resources of the Mysorean dominions, thus formidable in themselves, cannot be fairly estimated, unless we take into account their advantageous position and the character of the sovereign. Lying in the heart of the Deccan, and strengthened by innumerable forts, they command the adjoining frontiers of all their neighbours; while the restless and enterprising spirit of the prince has long obliged all around him to keep in a state of constant military preparation, to them nearly as expensive as that of actual war. Few years were suffered to elapse, in which their territories were not either menaced or actually invaded. The open and defenceless frontier of the Carnatic was frequently the object of these incursions; and the territory of our ally, the nabob of Arcot, had often suffered devastations that are still remembered with horror. The British, who were bound by treaty to be the protectors of this prince, had their own territories plundered extensively; and, on one occasion, had been forced to submit to an ignominious peace, which was dictated to them at the gates of Madras.

159
Influence of
the French
over the
latter.
The French officers in India, many of whom had long been entertained in the service of Tippoo, had communicated to his policy that marked hostility against the British nation, by which it was so peculiarly distinguished. A splendid embassy, which had been dispatched to France, returned previous to 1789, before the breaking out of the late war; which must be regarded as the commencement of a regular system of hostility for the entire overthrow of the British power in the east.

Although the events of the French revolution operated to divert their attention from prosecuting the objects of this new alliance, the power of Tippoo had become so formidable to the British government, that the revenues of Madras and Bombay were inadequate to support the forces necessary for their defence. Large supplies-

India. supplies both of troops and of money were required from Europe; and experience had fully proved, that unless the power of the kings of Mysore was reduced, the British possessions in the east could not be retained without incurring an annual loss to the state.

Happily the power, talents, and ambition of the present sultan were fully known to the whole of India. His views of universal conquest had alarmed all the native powers of the peninsula; and both the Nizam and the Mahrattas were roused to combine for their own defence. Tippoo was the first Mohammedan prince, since the establishment of the Mogul empire, who openly disclaimed the authority of the king of Delhi, or Great Mogul. He was the first also to impress coin with his own titles; a mark of disrespect which none of the native governments had ever shewn. The great seal which he adopted soon after his father's death, and which he affixed to all his public deeds, declared him to be "the messenger of the true faith," and announced his ambition to appear as a prophet as well as conqueror. In the spirit of eastern vanity, he not only declared himself the greatest king on earth, but announced himself to be the restorer of the Mohammedan faith; and to avail himself of the enthusiasm of his sect, he invites all true Mussulmans to join his standard, and not only to drive the European infidels out of India, but to establish the empire of Mohammed over the world.

160
His excessive ambition unites different states against him.

An ambition so openly avowed, and to an extent so inordinate, created immediate alarm among the native powers of India. It rendered an union peculiarly necessary between the Nizam and the Mahrattas; states who differed in religion, in government, and in every point of interest, except that fear, which combined them against this powerful adversary, who was ever ready to attack them, and who, in fact, already commanded their southern frontier.

The policy of the British, who had earlier foreseen the danger, led them to adopt a still more vigorous preparation than the native powers. Four additional regiments had been raised in Europe, and sent to India under General Abercromby and Colonel Musgrave; and as early as 1788, there were in that country thirteen European battalions, consisting of 8000 men, besides the troops in the company's establishment. Earl Cornwallis, and several of the first officers in the British service, were appointed to command them, under a new system, by which the powers of the governor-general and commander in chief were united in the same person. Thus the counteraction of different authorities was avoided, and every advantage secured which might give efficiency to the operations of warfare.

Happily for the execution of those views of defence, the climate of the Mysore, like all the central parts of the peninsula of India, is temperate and healthy, in a degree superior to that of any other region of the globe lying within the tropics. The monsoons which deluge the coasts of Malabar and Coromandel, have their force broken as they approach the high mountains of the interior, where they fall out in showers, which, though heavy, are not commonly of long continuance. The verdure of the country is thus preserved; and the temperature of the climate is moderated throughout almost the whole year. The British army was therefore able

to remain constantly in the field, during the whole war; and although they did not enter into cantonments, or leave their tents, yet the health of the troops did not materially suffer.

The military operations against Tippoo may therefore be divided into campaigns, not so much from the change of season, as from the success or failure of the several plans of attack that were carried on against that prince. The first campaign commenced in the month of June 1790, and was directed to the southern part of the peninsula, with a view to relieve the rajah of Travancore, whose country had already been attacked by the sultan. During it, the main army was commanded by General Meadows; and before the end of the year, it effected the reduction of his rich provinces below the mountains; while the Bombay troops, under General Abercromby, conquered the valuable districts below the Ghauts on the west and north, as far as the river Baliapatam.

The second campaign was carried on by Earl Cornwallis in the heart of Tippoo's dominions. Though unsuccessful in effecting its ultimate object, it was distinguished by the capture of the important fortress of Bangalore in the interior of the country; an event which fixed the seat of war in the enemies territory, and was decisive of its final success. A successful battle was also fought in the vicinity of Seringapatam; and a demonstration made against that capital, which, from the advanced season and the swelling of the Cavery, proved abortive.

The last failure, which must in part be ascribed to the delay of the Mahratta armies, and the want of provisions, was speedily followed by the arrival of these allies, and by preparations for a fresh campaign. As these new efforts completely humbled the sultan, and produced a successful termination of hostilities, it is necessary to detail them more particularly.

The season of the year, which, after the battle in 1791, prevented an immediate attack of Seringapatam, was also unfavourable to the numerous draught cattle belonging to the army. They were infected with an epidemic disorder, which was aggravated by famine, and killed them in vast numbers; while the remainder, from disease and hunger, became unfit for service. Meanwhile the scarcity of grain, of arrack, and every article of subsistence, daily increased; this scarcity became at last so urgent, that the camp followers, which in India are four times as numerous as the fighting men, were reduced to the necessity of devouring the putrid flesh of the dead bullocks; and to add to all these calamities, the smallpox unfortunately raged in the camp.

Similar distresses were suffered by the Bombay army, who, with infinite labour, had dragged their artillery for 50 miles through the most steep and difficult passes, in order to co-operate with Lord Cornwallis. Unable to form a junction, from the swelling of the Cavery, and the badness of the roads, they were compelled to retrace their steps over those vast woody mountains, which form the immense and impregnable barrier between the kingdom of Mysore and the Malabar coast. In this perilous retreat, the battering train of both armies was unavoidably lost, being too unwieldy to be moved by the small portion of draught cattle which now survived; upwards of 40,000 had already perished since the commencement of the campaign.

Disappointed

India. Disappointed of the relief and assistance which the junction of the Bombay troops might have afforded, the position of the main army became a scene of the greatest distress. The tents and clothing of the troops, as well as their provisions, were nearly worn out. Great part of the horses of the cavalry were so far reduced by want and fatigue, that they were unable to carry their riders. The ground at Caniambaddy, where it had encamped for a few days to favour the junction, or to protect the retreat, of General Abercromby, was covered to an extent of several miles, with the carcases of the cattle and horses; and the last sight of the gun carriages, carts, and stores of the battering train, left in flames, was the melancholy spectacle which the troops beheld, as they passed along, on quitting this deadly camp.

Fortunately for them in this dreadful situation, they were met, before they had finished the first day's march, by the allied force of the Mahrattas, under Purseram Bow and Hurry Punt. Every despatch sent to these chiefs had been intercepted by the vigilance of the enemy. They were astonished when they learned the disasters which had been occasioned by their delay: their arrival, which evinced their sincerity in the cause, produced general satisfaction in the British camp, and a conviction, that the ruin of the sultan, though delayed, must now become certain and inevitable. Tippoo himself, on seeing his enemies firm and active in their union, was not insensible to the dangers that awaited him. Before the allied armies left the vicinity of his capital to forward their preparations for a new campaign, he made overtures to Lord Cornwallis for the conclusion of a peace; but that nobleman would listen to no terms of accommodation in which his allies were not included, and which were not preceded by the release of all the prisoners that had been detained during the present and former wars.

163
junction
with the
Mahrattas.
The arrival of the Mahratta troops, amounting to 32,000 cavalry, however fortunate it might be deemed at the critical moment in which it happened, brought little additional effective strength to the allied army. Their battalions were unwieldy, irregular, and ill-disciplined: their force had declined as much as Tippoo's had advanced in improvement; and they were at present far inferior to those troops who, under Madha Row, had defeated Hyder Aly in 1772. Their chiefs were, however, overjoyed that they had effected a junction nearly on the spot where that signal victory had been obtained. They were pleased at having met the British army without having occasion to try their strength singly with Tippoo, of whose discipline and abilities in the field they entertained a deep apprehension.

164
Appearance
of their
camp,
To avoid confusion and interference, they were encamped at a distance from the British troops. Their ground, from the number of followers, and their families, had the appearance of a large town, or of a whole nation emigrating from its territory. The tents of the chiefs are placed around their general's, without any regularity or order. They are of all dimensions, and of every variety of colour, resembling houses rather than canvas. The streets, winding and crossing in every direction, present the appearance of a great fair; in which smiths, jewellers, merchants, and mechanics, are displaying their wares, and as busily employed in their

trades, as if they lived in their own capital, and enjoyed a profound peace*.

The state of their artillery, upon which modern warfare so much depends, will at once demonstrate the imperfection of the military system among the Mahratta states. In the construction of their gun carriages, they make little use of iron, but for their strength they trust to the bulk and solidity of the timber: Hence they are unwieldy from their weight, and clumsy beyond all belief; the wheels, in particular, are heavy and low, being formed of large solid pieces of wood united together. The guns themselves are ponderous in the extreme, and of the most irregular dimensions; each is painted in a fantastic manner, and bears the name of some one of their gods. Not a few are dragged after the army long after they have ceased to be serviceable, from the great estimation they are held in, on account of past achievements which they are supposed to have performed for the state. Some of these useless impediments of a march are dragged along at the immense expence of 100, and sometimes 150 draught cattle yoked in pairs. The most insurmountable obstacle to the efficiency of the Mahratta artillery, was the scarcity of ammunition with which they were provided at this period; subsequent improvements have enlarged this supply, and rendered them far more formidable to their enemies.

The infantry of this nation holds a rank, if possible, still more contemptible than their artillery. Its officers are half-cast Portuguese or French; and the privates consist of outcasts of every description, who are uniform in nothing but in the wretched condition of their muskets, ammunition, and accoutrements. The Mahrattas themselves hold them in contempt, ride through them on the march, without ceremony, or even the appearance of respect. If there happen to be a few Europeans among the officers and men, which in these times was but seldom the case, they execrate the service, and till they find an opportunity of escape continue to deplore their fate.

The cavalry is the favourite portion of a Mahratta army; and it is to his horses, and the bazars, that the attention of every chief is almost solely directed. On marching days, the baggage and infantry move off at daybreak, while the chiefs and their principal followers remain upon the ground smoking their hookahs till they have advanced some miles; they then follow, each pursuing his own route, attended by his principal people; while the inferior ranks disperse over the country to plunder and forage in every direction.

The troops of the Nizam at this period joined Lord Cornwallis and the Mahrattas; their state of equipment and discipline was almost in every respect as wretched as that of the Mahrattas. Their forces, when united, amounted to about 80,000 men; and if to these be added four times the number of camp-followers, brinjaries, and the carriage department, the number of strangers to be subsisted in the Mysore alone, cannot be much less than half a million. That no distrust, jealousy, or counteraction, should have disturbed the combined operations of such an immense multitude, must be ascribed to the unexampled moderation and vigilant conduct of the commander in chief. Such a vast army had never taken the field in India in the British cause.

cause; yet no murmurs, or even the slightest appearance of distrust, were ever manifested by the allies towards the British commander. They submitted with implicit confidence not only to his arrangements in carrying on the war; but, which was little to be expected among allies so much alive to their particular interests, they acquiesced in his distribution of the conquered territories with a deference which evinced the most perfect confidence in his liberality and justice.

The steady co-operation, however, of any native power with the British army in the field, is a circumstance hardly to be looked for, and must therefore prove a resource on which no commander would choose to rely. His patience will often be severely tried by their irregularities and delays; and in the most critical emergencies his views may be frustrated by their want of punctuality, or by a total failure in their engagements. Even in the article of provisions, the presence of the native armies, bating the temporary relief at their first junction, proved a much greater annoyance than a benefit; for it increased the number of mouths to be supplied, in a country desolated by its friends as well as by the hostile armies.

With these coadjutors, Lord Cornwallis set out in the month of June, towards Bangalore. He determined on a new and circuitous route, northward by Nag-gemungulum, that he might accomplish some of the important objects necessary to enable the confederates to commence another campaign. He had to enable the Mahrattas to withdraw the posts, which they had left on their march, when they advanced from Poonah towards Seringapatam. He had to confine the sultan to as small a portion of his territory as practicable, and thus to oblige him to consume the provisions which he had laid up for the defence of his capital: and, lastly, he had to gain time for collecting and bringing forward the vast stores of camp equipage, provisions, and supplies, which he had ordered for the succeeding campaign.

In order to facilitate the communication between the Mysore and the Carnatic, from which the supplies were chiefly to be drawn; the various hill forts, which command the different passes, were to be reduced. Many of these fortresses, from their situation upon high and precipitous rocks, are of such strength that they have always been deemed impregnable by the native armies of India. In ancient times they formed the inaccessible retreats of the rajahs who still retained their independence; and it was not till the vigorous administration of Tippoo and his father, that they were brought into subjection and garrisoned by the Mysorean troops.

Among these forts, Savendroog, Chittledroog, and Kistnaghury, are the most remarkable in point of natural strength. The first of these consists of a vast mountainous rock, which rises above half a mile in perpendicular height above its own base, which covers a space of eight or ten miles in circumference. This rock is surrounded by walls on every side, and defended by cross barriers wherever it was deemed accessible. Towards the upper part, the immense pile is almost precipitous, and has the farther advantage of being divided on the top into two hills, which have each their defences, and are capable of being maintained independent of the garrison in the lower works.

India

To the siege of this tremendous fortress, Lieutenant-colonel Stewart commanding the right wing of the main army was appointed. The attempt commenced on the 10th of December, when this officer pitched his camp within three miles of the north side of the rock. The formidable appearance of the place itself, had withdrawn the attention of the troops from a circumstance which proved on trial the chief obstacle to the execution of their arduous attempt. It consisted in the formation of a gun road from the camp to the foot of the mountain. This was found a work of incredible labour, since it led through a long tract of rocky hills, thickly planted with bamboos; and after every effort, the battering guns were still to be dragged over rocks of considerable height, and of an ascent almost perpendicular.

This celebrated rock, so difficult of approach, and of such immense strength, is no less famed for a noxious atmosphere, occasioned by the hills and immense tracts of wood by which it is surrounded; the appellation of *Savendroog*, or *Rock of death*, is said to have been given it from the noxious and fatal nature of its climate. Tippoo Sultan, sensible of all its advantages, congratulated his army on the infatuation of the British which had at last led them to an enterprise which would speedily operate their disgrace, and terminate in their ruin. One half of the Europeans, he asserted, would be destroyed by disease, and the other half he was confident would be killed in the assault. The garrison which Tippoo had selected for the station of Savendroog were of the same sentiments with their master: regarding the attempt to reduce it as madness, they fortunately trusted more to its strength, than to their own exertions for its defence; and hence, little or no opposition was made to the erection of our batteries, farther than the ill-directed fire of their artillery produced.

In three days, during which it was found necessary to advance the batteries nearer to the wall, a practicable breach was effected, and a lodgment made for the troops within twenty yards of the breach. The storming party, which consisted chiefly of Europeans, was led by Lieutenant-colonel Nibet, and was divided into four different parties of attack, in order to secure both hills into which the mountain was divided, and to distract the attention of the enemy. Each party succeeded in gaining its object; for a large body of the enemy who were seen in the morning coming down for the defence of the breach, on observing the Europeans advancing to the storm, was seized with a panic, and fled. The eastern hill immediately above the breach, was carried by Captain Gage, without meeting, or even overtaking, the enemy; the main body of which endeavoured to gain the western hill, and, had they effected their object, the siege must have recommenced. Happily, however, the pathway leading from the breach to this hill is so steep and narrow that the fugitives impeded each other, and the assailants pressed them so hard, that they entered the different batteries along with the enemy. In these numbers were killed, among whom was the second killadar; and the citadel on the summit of the hill was at last gained, where the first killadar was made prisoner. So close and critical was the pursuit.

167

Savendroog
besieged,

169

and taken.

India. on this fortunate occasion, that a serjeant of the 71st regiment, when at some distance, shot the man who was in the act of shutting the first gate; and upon this occurrence, almost accidental, the fate of the citadel hinged. It was instantly taken, without the loss of a single man; although an hundred of the enemy had been killed during the advance, and many had perished by falling from the precipices in endeavouring to escape. Only one private soldier was wounded in this remarkable assault of the impregnable fortress of Saven-droog: it formed a display of successful prowess, fortunate almost beyond example; and it exhibited before the enemy, in open day, an instance of intrepidity, of high value to the reputation of the army and the interests of the India government.

The beneficial consequences of this important capture, were sensibly felt at the different forts, almost impregnable, by which this part of the country is so remarkably strengthened. Colonel Stewart's detachment, which had been so much distinguished by this achievement, marched in two days against Outredroog, another fortress strengthened by five different walls, and so steep as to prove tenable by a handful of men against the largest army. After the refusal of a summons to surrender, the lower fort was escaladed with such rapidity, that the killadar requested a parley. While this was in agitation, an appearance of treachery was discovered in the upper fort, where the garrison were seen moving and pointing their guns against the assailants. Fired at this sight, Lieutenant M'Innes led on the storming party with impetuosity; some of the gates were instantly broken, others were escaladed, till five or six different walls on the face of the steep rock were passed, when the troops gained the summit, and put the garrison to the sword. So panic-struck were the enemy, when they saw a single European above the walls, that they could make no resistance. The killadar was made prisoner, a number of the garrison was killed, and not a few, terrified at the approach of Europeans with their bayonets, are said to have precipitated themselves from the rocks.

171 Effects of these successes. The assault of these fortresses, which had hitherto been deemed impregnable, made so serious an impression on the enemy, that in none of the hill forts, however inaccessible, did they afterwards make an attempt to resist the British troops. Hence, the strong mountainous country between Bangalore and Seringapatani, which, studded with forts, had so much checked all communication, now afforded security to the convoys. These now reached the army without opposition; and the supplies of warlike stores of every description were as completely re-established as they had been at the beginning of the last campaign.

To prevent any future scarcity of the great article of grain, the commander in chief encouraged the native brinjaries, a class of men whose employment is purchasing grain where it is cheap, and selling it to the army. By constantly affording regular payment and a good price to these native merchants, they supplied the camp to an extent far exceeding what could ever be furnished by the most extensive carriage establishment. The grain-dealers had at this time passes for no less than 50,000 bullocks, whose rice was instantly paid for, as soon as it reached the camp, and orders given

for purchasing more from whatever quarter it could be procured. This brought forth the resources of the enemies country as well as our own; for several of Tippoo's brinjaries, tempted by the certainty of payment and a high price, sold their rice in the British camp.

Supplies being thus provided to an extent far exceeding every former example, the allied armies, and the different detachments, were ordered to assemble for another campaign. The Bombay troops, destined again to act from the same quarter as last season, marched from Cananore, and arrived at the foot of the Poodicherrim Ghaut in the month of December. Several weeks of hard labour were necessary to drag the artillery through woods extending near 60 miles, and over mountains of immense height. These mountains, which on the west command a view of the Malabar coast, and on the east of the country of the Mysore, form an elevated ridge towering into the clouds, on which the rivers are seen taking their rise, and flowing in different directions, till they reach the eastern and western shores of the peninsula. The friendly territory of the Coorga rajah surrounds the interior of this formidable pass, where a small opposition might bid defiance to a whole army. This circumstance enabled the Bombay troops, consisting of 8400 men, with all their baggage and artillery, and a supply of rice for 40 days, to penetrate with safety into the Mysore frontier, which they reached on the 22d of January 1792. To facilitate the return of our army, batteries were constructed, and the defence of this pass committed to Lieutenant-colonel Peché with 300 men, a precaution which had not the sultan overlooked, he would have suffered no invasion on this quarter of his dominions.

The Mahratta forces, which had separated from the main army at Bangalore, had spent the season of the monsoon in a train of exploits which seemed to imply more than their usual share of activity. With the assistance of the Bombay detachment of three native battalions, they took the important post of Simoga, after defeating Reza Saib and near 10,000 of the sultan's cavalry. This brilliant success encouraged Purseram Bow to engage in an enterprise against Bednore, which had nearly frustrated the whole plan of the campaign, by protruding his junction with General Abercromby beyond the stipulated time. From this attempt, however, he was diverted by the arrival of Cummer-ud D-en Khan, one of Tippoo's best generals, who had been dispatched against him. This chieftain retook the fort of Simoga; but being too weak to encounter the Bow in the field, the Mahrattas effected their junction with the Bombay army, though somewhat later than the appointed season. The main army under Lord Cornwallis, which had been so actively employed during the rains in subduing the hill forts, and in collecting the necessary stores and reinforcements, was ordered ultimately to assemble at Outredroog, one of the strongest of Tippoo's forts, which was situated within 50 miles of his capital. This place, being equally spacious and strong, was fitted up as a general hospital, and formed into a magazine for the grain and public stores that were not immediately needed for the army. The battering train under Colonel Duff, and the last convoys under Colonel Floyd, having safely joined, the main army was at last fully prepared to resume its enterprises against

India. against the sultan, who, in imitation of his father, when formerly attacked in 1767, had encamped with the whole of his force in a strong position under the walls of his capital.

One junction more was still expected; that of the Nizam or Soubah from Gurrumcondah, the lower fort of which he had captured. This prince having left a strong force to garrison the place, marched again to meet Lord Cornwallis, who was detained in expectation of this event for several days beyond the time he had appointed for leaving Outredroog. On the 25th of January, the young prince at last arrived with his army; his youth and inexperience were put under the guidance of a minister 60 years of age, a man of great talents and established reputation. The confederacy, which thus united the chief powers in the peninsula for the overthrow of a formidable and ambitious enemy, was attended also by an ambassador, who arrived at this time, from Madajee Boonsla the rajah of Berar. The Peshwa and the Nizam were themselves in the field on their respective frontiers, and all India looked with anxious expectation to the event of this important campaign.

173
The allied
army ap-
proaches to
Seringa-
patam.

On the 11th of February the allied armies marched from Hoolleadroog, the last hill fort of which they had taken possession, lying at the distance of only 40 miles from Seringapatam. Tippoo's cavalry, which had been sent out to harass them on the march, made little impression, and were therefore chiefly occupied in burning the intermediate villages, and in laying waste the country. The last march of the 5th of February, stretched across a range of barren hills lying six miles north-east of Seringapatam. From these heights, a view of the whole city was presented to the army, and the encampment of the sultan under its walls. Every circumstance was eagerly viewed by our troops; and, from the sultan's position, it was evident he meant to defend the place in person, and to make it the grand concluding scene of the war.

The camp of the allies was pitched on the north side of the island. The British formed the front line, and extended its whole length on both sides of the Lockany, a small river which at this place flows into the Cavery. The reserve was placed a mile in the rear, to afford space for the baggage and stores; and the Nizam and Mahrattas were stationed still farther in the rear, to prevent interference with the British camp.

Opposite to Seringapatam, on both sides of the river, a large space is inclosed by a bound hedge which marks the limits of the capital, and affords a refuge to the peasants during the incursions of cavalry. Tippoo's front line, or fortified camp, lay immediately behind this hedge, where it was defended by heavy cannon in the redoubts, and by a large field train advantageously placed. In this line there were 100 pieces of artillery, and in the fort and island which formed his second line there were above thrice that number. The redoubts on his left were entrusted to two of his best officers, and a corps of Europeans commanded by Monsieur Vigie; Sheik Anfar, a general of established reputation, was stationed on the right, and the Carighaut hill; while Tippoo himself commanded the centre, having his tent pitched in the sultan's redoubt. The fort and island, where there was the greatest number of

India. guns, were entrusted to Syed Saib and other commanders. The whole army of the sultan, thus stationed, consisted of about 50,000 men.

Ever since the junction of the allied armies, Tippoo finding he could not keep the field, employed his chief attention, and the labours of his main army, in fortifying this camp, and in strengthening his defences in the fort and island. The country had already been laid waste in the former campaign; and the sultan seemed to rest his hopes, that the strength of his works and the valour of his army would protract the siege, till the want of supplies, or the approach of the monsoon, would again force his enemies to abandon their enterprise, as they had been compelled to do on former occasions.

Impressed with these ideas, Tippoo made no attempt to interrupt our reconnoitring parties, who had been busily employed on the first day after their arrival in examining his camp. The distance of our position, and the absence of the armies under General Abercromby and Purferam Bow, increased his security: for he did not imagine that Lord Cornwallis would venture to attack him without their assistance; far less could he believe that a fortified camp, defended by the guns of his capital and a powerful army, would be attempted by infantry alone, without guns, and in the uncertainty of night.

The promptitude and spirit of Lord Cornwallis had suggested far different ideas, and a plan of attack which was bold beyond even the expectations of his own army. On the evening of the sixth of February, just after the troops had left the parade, orders were issued for an attack at 7 o'clock of the enemies camp and lines in three divisions. The British camp was left to be defended by the artillery and cavalry; while the assailants who were instantly furnished with guides and scaling ladders, marched in perfect confidence that muskets alone would prove the fittest instruments for opening their way into the enemy's camp.

No part in the execution of this bold enterprise was assigned to the troops of the allies; nor was the intended assault even communicated to them, till after the columns had marched. It was perhaps good policy to conceal from them a measure so repugnant to all their maxims of war, and in which they could not possibly concur. This opinion seems justified by the surprise and consternation which they displayed, on learning that Lord Cornwallis, like a common soldier, was personally to lead the attack on the enemies fortified camp. They not only deemed his success impossible, but they dreaded that the ruin of the allied armies would be involved in the attempt.

The three columns into which the assailants had been divided, marched with equal intrepidity to execute the different objects that had been allotted them: many obstacles intervened; various conflicts ensued in different quarters of the enemies camp; each party was uncertain of the fate of the rest, and each individual of his associates. The return of day at last removed their fears and uncertainty, by disclosing the complete success which had crowned their exertions throughout the whole line of attack.

The right column commanded by General Meadows had met with more impediments than the rest; it attacked and carried the *ead gah*, a redoubt on the en-
emies

174
Tippoo's
camp at-
tacked,

India. mies left, which was defended by eight guns, and a numerous garrison, nearly 500 of which fell in this attack. Considerable loss was also sustained by the British in this redoubt. After its capture, the column was again formed in its original order, and marched with a view to support the centre under Lord Cornwallis; but mistaking the proper track, and making too wide a circuit, it reached the Carighaut hill on the enemies right, which had already been carried by Col. Maxwell.

The centre column about 11 o'clock forced through the bound hedges, amidst a heavy fire from the sultan's redoubt and Tippoo's lines. These, however, were also forced. The troops were now enabled to cross the river, and penetrate into the island. So closely did they press upon the fugitives, that they would have entered the citadel along with them, but for the precaution of raising the drawbridge, which they had drawn up at the moment of entering the place. So precipitately had Tippoo been forced to abandon his tent in the sultan's redoubt, that his silver sticks, pikes, and mathematical instruments, were found scattered in the place. The fort being inaccessible from the removal of the bridge, the advanced party forced into the town or pettah, which had been almost abandoned for the defence of the batteries. Here they found 27 half-starved Europeans, loaded with irons, and confined in a dungeon. Some of these unhappy men, who were now relieved, had been cruelly given up to Tippoo by Admiral Suffrein; others were deserters, whom Tippoo, however, had treated with equal severity.

The left division of the attack, which was commanded by Lieut. Col. Maxwell, was destined to take possession of the Carighaut hill, and from thence to descend and penetrate into the island on the right flank of the enemy. These objects were effected with rapidity, and but little loss, except in crossing the Cavery, which was deep and rapid, and at the same time strongly defended by the enemy's batteries. In crossing the stream, which at this place was neck deep, the ammunition was unavoidably damaged; but the troops pressed forward with the bayonet, and at last joined the other divisions who were now assembled at the pettah.

The enemy having lost all their positions on the north side of the river, where the siege was to commence, and almost the whole of the island, every material object of the assault was secured. On the side of the British, the loss, though considerable, was small in proportion to the importance of the victory, and the disasters of the enemy; of whom, it afterwards appeared, that no less than 20,000 had either deserted, or been slain in the various conflicts during this night of enterprise, danger, and death.

On the 7th, the enemy, as if ashamed of the rapidity with which their different posts had been abandoned, made several attempts to recover them. Their efforts were directed chiefly to the sultan's redoubt, commanded by Major Sibbald. Exposed to the guns of the fort, and the batteries on the island, the major's little party defended the place for the whole day; and having successfully repulsed the different assaults of the enemy, they at last, weary of the attempt, desisted from the enterprise. The endeavour which the sultan's troops made to regain the pettah, met with a similar check; and the night of the 7th would have afforded some re-

pose to the army, had not the rumour of an intended attack by Tippoo during the night, kept them on the alert. That such an attack had been meditated, there was full evidence; but both the chiefs and the soldiery were so much dispirited by the fatal train of events that had so rapidly taken place during the last twenty-four hours, that they could not be induced to second the zeal of their sovereign. During the various conflicts of the 6th and 7th, the fatigues and dangers of the British army were severe; and its loss in killed, wounded, and missing, was far from being inconsiderable (536 men). The extent and importance of the acquisitions gained by this brilliant contest seemed, however, to compensate every sacrifice that had been made. It now occupied the lines and posts from which the enemy had been driven; and the works which had been so completely fortified for the defence of the capital, now became lines of circumvallation for its attack. The troops on the one side were broken and dispirited; on the other they were in perfect order, and animated with their recent success. The Europeans in the service of Tippoo, after the disastrous events of the last two days, now despairing of his fortunes, deserted to our army; and many of them enlisted with the Mahrattas; others retired to the French settlements. After their departure, the sultan's army never encamped in order, or assumed a formidable appearance.

The British army, now in possession of the island and town of Seringapatam, was immediately employed in making the necessary preparations for the siege of the fortress or citadel. This enchanting island being plentifully watered by the Cavery, and a vast number of intersecting canals, maintains a perpetual verdure: on the east, it is decorated by the buildings of the fort, which occupies a mile square; on the west, by the Laul Baug, containing the mausoleum of Hyder Aly, adorned by tall cypresses, shaded walks, and a variety of trees, whose foliage and perennial verdure announce an everlasting spring. The mosques and religious buildings were converted into hospitals for the wounded and sick; and the trees, now for the first time assailed by the axe, furnished materials for fascines and gabions for the approaching siege.

The proud mind of the sultan could not remain tranquil, on seeing his beautiful gardens and all his improvements threatened with destruction, by an enemy who was also preparing to deprive him of his citadel and all that remained of his power. His indignation was expressed by a continual discharge of cannon from the fort, directed against the island, the redoubts, and every party of ours that seemed within his reach. Some of his shot ranged as far as the camp, aimed apparently at head quarters: but the distance of the several posts was too great; and his ineffectual cannonade served rather to proclaim the wrath of the sovereign, than materially to annoy his enemies.

Tired by these repeated efforts, which he saw were vain, and worn out by the ebullitions of his own anger, Tippoo at last began to meditate seriously on the necessity of a peace, the only means by which he could extricate himself from his perilous state. In order to smooth the way for his overtures, he previously liberated two British officers, who had been detained contrary to capitulation in Coimbatore; these officers, till now the victims of his cruelty, he loaded with presents, and made them

India. them the bearers of a letter to Lord Cornwallis suing for peace. Another expedient, more daring, but far less honourable, was nearly at this time practised to attain his deliverance. A small party of horsemen were despatched to the British camp in the night, for the purpose of assassinating the commander in chief: as straggling parties of the Nizam's horse were near, the troopers, mistaken for friends, had little difficulty in entering the camp; and, but for an accident, might have effected their purpose. Detected, however, by their inquiries for his lordship's tent, they were fired at by a party of recruits; and such was the speed with which they made off, that they suffered little damage in this disgraceful enterprise, which is so often resorted to by the princes of India. This was the second attempt against the commander's life during the present war: that both were unsuccessful, must be ascribed to that intoxication in which the natives are plunged, before they can be induced to venture upon such hazardous deeds.

Though Tippoo had recourse to these vile projects, which he knew were countenanced by the practice of his country, he did not trust to them solely for his defence. The Bombay army which was at this time approaching, he combated and harassed by every effort of honourable war: its junction, however, with the main army was effected on the 16th; and on the second night after this event, the trenches were opened, and a parallel formed within 800 yards of the north face of the fort. General Abercromby, stationed on the south quarter with a strong detachment, was ordered to cannonade it from the heights. This attack being directed against the weakest part of the fort, occasioned the greatest alarm. Tippoo himself, therefore, at the head of his troops, marched to dislodge the general: being supported by the guns of the fort, he maintained the action for the whole day; but towards evening, he was forced to retreat.

This desperate effort was the last that Tippoo made for his defence. His affairs hastened to a crisis; cabals were formed by the chiefs, and his troops deserted in multitudes during the night. Plenipotentiaries from the allies, since that, had been treating with his vakeels; his haughty spirit, hitherto untractable, was now forced to yield to their demands. He saw his capital blockaded on every side by a powerful army, plentifully supplied with provisions, which must infallibly reduce his troops by famine, should they even prove successful in repelling its assaults; even his last hopes of relief from the monsoon, and the swelling of the river, were thus finally cut off.

On the 23d of February, therefore, the preliminaries of peace were signed by Tippoo, amidst the conflicting emotions of pride, resentment, and fear; and orders were issued to the troops on both sides to cease from farther hostilities; a stipulation, of which the dread of an immediate assault alone enforced the observance.

By the terms of this treaty, Tippoo was compelled to pay, as an indemnification for the expenses of the war, three crore and 30 lacks of rupees at two instalments, the

first to be advanced immediately, and the second at the end of four months. Other articles of this instrument provided farther, that the whole prisoners taken from the allied powers from the time of Hyder Aly, should be unconditionally restored; that no less than one-half of his territories should be ceded to the allies; and that two of Tippoo Sultan's three eldest sons should be given as hostages, for the due performance of the treaty.

The candid and upright conduct of Lord Cornwallis had gained the full confidence of all the allies. So complete was the ascendancy he possessed over their councils, that they submitted without a murmur to all the arrangements which he proposed; a circumstance (considering the deep interests which were at stake) that must be regarded as not the least extraordinary in this campaign.

The terms of this agreement, which resembled a capitulation more than a treaty, were hard, and Tippoo with great difficulty was prevailed on to subscribe to them. Another struggle, perhaps still greater, yet remained for his family. This arose from the distress in his seraglio, on parting with his children. The sultan was entreated to request another day for making preparations for their departure; and Lord Cornwallis, though he had already dispensed with their accompanying the treaty, as first agreed, had the humanity to grant this request.

About noon day on the 26th the princes mounted their elephants richly caparisoned, and attended with a splendid retinue left the fort, the walls and ramparts of which were crowded with multitudes of spectators. Amidst the vast multitudes whom curiosity or affection had drawn out to witness this scene, Tippoo himself was beheld standing above a high gateway, through which, as they passed, the princes were saluted by the guns of the fort; a compliment which they again received as they approached the British camp. They were seated in silver howdahs, attended by their father's minister, and a numerous retinue. The procession which they thus formed, was equally grand and interesting. It was led by several camel barcarras and standard-bearers, carrying green flags suspended from rockets, followed by one hundred pikemen with spears inlaid with silver. Their guard of two hundred Sepoys, and a party of horse, brought up the rear (c).

In this order the princes proceeded till they approached the tent of Lord Cornwallis, who had ordered a battalion of Sepoys for their reception; where the commander in chief embraced them with a cordiality and tenderness that resembled parental affection. The manners, dress, and appearance of the young princes themselves, formed an interesting spectacle to their European hosts. Bred up from their infancy with infinite care, and instructed to imitate in their manners the reserve and politeness of more advanced age, all present were astonished to observe the correctness and propriety of their conduct. Abdul Kalick, the eldest, was of a dark complexion, even among the natives of India; but his countenance was marked by thoughtfulness and intelligence.

176
Treaty of
peace signed
by Tippoo.

(c) For the substance of this account we are indebted to an eye witness, Major-general Dirom; who has favoured the public with an excellent narrative of this campaign.

India. gence. The younger, Mooza ud Deen, was remarkably fair; a regular set of features, with an open appearance, rendered him the general favourite, and more admired than his brother. Clothed in red turbans and long white muslin gowns, every where sparkling with emeralds, rubies, and pearls, their external decorations displayed a brilliancy far surpassing every European idea of dress, and seemed to realize those laboured descriptions of splendor, which are in the western world only seen in the pages of romance. Thus attired, the young princes, immediately after their reception, were seated on each side of Lord Cornwallis, when Gulam Aly, the head vakeel of Tippoo, thus addressed the British general: "These children were this morning the sons of the sultan my master: Their situation is now changed: They must look up to your lordship as their father."

The conduct of the commander in chief had perhaps suggested this address: he had in fact received the boys, as if they had been his own sons; and he again anxiously assured the vakeels, and the young princes themselves, that every possible attention would be shown them, and the greatest care taken of their persons. The scene became more interesting; the faces of the children brightened up; and not only their attendants, but all the spectators, were delighted to observe, that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation. With regard to the youngest, this desirable object was likely to be first attained. He was the favourite son, and was said to be the sultan's destined heir: his mother, a beautiful and delicate woman, had lost her brother in a late action; and she herself had died of fright a few days before the attack of the lines. These circumstances, together with his own captivating appearance, drew to the youngest boy the greatest share of attention, and rendered his situation doubly interesting.

After being regaled, in the eastern manner, with otter of roses and betel nut; the princes were presented each with a gold watch from Lord Cornwallis, a gift from which they seemed to receive great delight. On this occasion the ministers of the Nizam and the Mahrattas attended with their suites; and when the ceremony of their reception was ended, the princes were led back to the tents furnished by the sultan, which were of a green colour, an emblem of majesty which Tippoo always had carried with him into the field.

The detaining of Tippoo's sons as hostages, may be deemed a rigorous condition imposed on that prince; the event, however, soon proved, that without this precaution, he never could have been induced, unless by a renewal of hostilities, to fulfil the terms of the treaty. The value of the money to be received, as well as the rents of the different districts to be ceded, were keenly disputed. When the territory of the Coorga rajah, in particular, was required, the demand seemed unexpected both by the sultan and his ministers, and was at first received with astonishment and disdain. This rajah was considered as a chief cause of the war, and Tippoo, therefore, wished to crush him. Lord Cornwallis seemed equally resolute in his defence; for he again manned the works, and threatened to recommence the attack. Happily, his stock of provisions was ample; and al-

though upwards of 400,000 strangers and half a million of cattle were daily to be fed, the supply was sufficient for the whole; while one million sterling of the fine imposed on Tippoo, had already been paid. The firm determination of the commander in chief, aided by these circumstances, which were not unknown to the sultan, damped his resolution. His resentment cooled, and he finally implemented the terms agreed upon, copies of which were delivered to the confederated powers.

The war against Tippoo, which was now happily terminated, placed the dominions of the India Company and of their allies in a state of safety and tranquillity which they had never enjoyed since the aggrandisement of his ambitious family. In the former campaigns against the Mysore, the civil and military powers were placed in separate hands; measures were planned without either energy or uniformity of system; and their execution being entrusted to other hands, seldom displayed the promptitude or vigour necessary to their success. They had often ended in the accumulation of debt, without adequate advantage; sometimes they produced the devastation of the company's possessions; and hitherto they had uniformly increased the power and pretensions of the formidable adversary whom they were meant to subdue.

This war just concluded, was followed by effects suited to the energy and perseverance with which it had been conducted. The one half of his dominions was at once wrested from the hands of the common enemy; and while his power was thus diminished, an additional strength and security was conferred on his neighbours, by that impregnable barrier which was added to their territories. In the three different campaigns the sultan's loss had been great; in the last, it seemed almost irredeemable, not less than 67 forts were taken, 800 cannon fell into the hands of the allies; and the killed, wounded, and missing of Tippoo's troops amounted to 49,000 men. At the conclusion of the treaty very few places of strength were left in his possession; his treasury was drained, and the strength and spirit of his army completely broken. To the moderation of the British commander alone it was owing that he still remained a sovereign; for he was at last completely in the power of the victors. This moderation, but little merited by a cruel and vindictive enemy, he easily forgot when his power was afterwards revived, and he permitted his French counsellors to persuade him that he was again able to contend against the British government.

In the meantime, however, the India Company's territories sensibly felt the advantages of the treaty of Seringapatam. The presidency of Madras, which was most exposed to inroads from the Mysore, has by that event secured a chain of forts along its frontiers, which has ever since effectually freed it from the evils of invasion. The Carnatic, recovered from its former calamities, must improve its revenue, while it is defended at a less expence. The Malabar coast and presidency of Bombay has experienced, ever since the victory at Seringapatam, a state of still greater security than the Carnatic. It contains a country the most varied, and perhaps the most fertile in India, which under a regular government may be improved to an extent at-

present:

present almost inconceivable. Hitherto, from being a scene of constant war and bloodshed, it has not been suffered to develop its resources.

While the relative situation of the British and the Sultan were thus improved by the pacification, the interests of our allies were perhaps still more essentially benefited. The Mahrattas have gained an addition of strength as well as territory, by enlarging their frontier from Darwar to the Tumbudra; and the Nizam has gained a similar advantage, being strengthened on the one side by the same river, and on the other by the Sanar and Gungecotta. Both powers are by their position placed nearer the aid of the British, to whom they must in future look up for their defence against all their enemies, as well as the aggressions of the Mysorean armies. During the seven years tranquillity that succeeded this memorable campaign, the armies of both these powers, having no external enemy to call forth their exertions, gradually relaxed in discipline, and assumed a still more tumultuary and unmilitary appearance.

On the other hand, the troops of Tippoo, from his unconquerable hostility to the British power, and from the secret instigations of the French, were kept in a state of constant preparation, by which their discipline was improved. The influence of time, and the resources of a vigorous government, gradually repaired the vast losses which had been sustained during the three last campaigns. The power of the Mysorean court had indeed been much impaired, but it had lost none of that antipathy and hatred against the neighbouring states by which it had always been distinguished.

Of all the confederated powers engaged in this war, the British derived, perhaps, the smallest share of the direct and immediate advantages which resulted from it. The prize-money shared by the army, although increased by the renunciation of the shares of Earl Cornwallis and General Meadows, was not great; and the territories that were ceded to the India Company being disunited and at a distance, seem to have been demanded rather with a view to weaken the common enemy than to add to their resources. Prior to the year 1799, the period of the final conquest of Seringapatam and the Mysore, more than two-thirds of the ancient territory of the Mogul empire still remained in the hands of populous and independent states, professing either the Hindoo or Mohammedan faith. Among the latter, the Nizam and the king of Mysore still held the chief rank; while five powerful Mahratta chiefs, the adherents of Brahmanism, occupied the first station in the former class.

Some of these princes, during the former wars in Hindostan, had individually arranged themselves on the side of the monarchy of France, against that of Britain. These rival and leading powers in Europe, had for near a century occupied a similar position in the east, which decided in some measure the fate of Asia. The republican councils, however, by which the French government had been lately subverted, embraced a much wider range in their foreign policy.

They attempted to form at once all these different princes collectively into a combination, which they hoped might become the instrument of their own ambition. Hence proceeded their warm professions of philanthropy to the natives, and their new-born zeal

for improving their condition, and for rescuing them from the rapacity and tyranny of the British. The same unperishable thirst after external conquest and universal dominion which instigated that nation to attempt those momentous changes, which were lately beheld in Europe, began to display their violence in the east, and to characterize the whole of the French policy in Asia. Confidential agents had already been dispersed over the territories of these princes; officers from France had been secretly lent out and appointed to their armies. For several years these agents had been sedulously employed not only in disciplining their troops, but in promoting among the native princes a combination for the purpose of subverting the British government, and for annihilating throughout the peninsula every power that might be deemed hostile to their own.

These schemes of ambition, wild and romantic as they may seem, have been executed with complete success over almost one half of Europe; and it must be confessed, that the power of the mighty confederacy which was projected in the east, was more than sufficient to subjugate the whole of India, had it been possible to effect the steady co-operation of its members in any common system of policy. A closer view of it will evince its power and efficiency for the execution of the most extensive plans even of French ambition.

The Mahratta empire, by being properly consolidated, must of itself command an immense force. Stretching throughout the whole length of the peninsula, from the bay of Bengal to the banks of the Indus, its population has been estimated at no less than forty millions of souls; while its known revenue has been found to amount to seventeen millions sterling. These resources, however ample, it must be noticed, are far more efficient in India than in Europe; they have there been found by actual experiment, adequate to the establishment and constant maintenance of an army of upwards of 300,000 men. Nor has the progress of the French emissaries in communicating European tactics to this immense force, been at all inadequate to the vast schemes of their policy, or to the magnitude of their undertaking; many battalions in the service of the Peshwa and of Holkar, but more especially in the establishment of Scindiah, have been found in a state of discipline that might have been deemed creditable in most European armies. Among the troops of this latter prince, the brigade of General Perron has long been distinguished by a system of tactics hardly inferior to that of the British Sepoys; it consists of about 40,000 men, who are regularly regimented and brigaded, and as completely clothed and accoutred as the British troops. The pay of this force is regularly issued, a rare occurrence in India; and while in the field, its operations are sustained by a well appointed artillery, consisting of upwards of 40 pieces of ordnance.

To the charge of this favourite portion of his army Scindiah has for some time past committed the capital of the empire, and the custody of the venerable but unfortunate Shah Allam; a monarch who, it is said, has reached the uncommon period of 90 years; and who, it would appear, is more wasted and broken down by an unexampled load of calamity, than by either the weight or feebleness of his singular age. The forcible restraints to which this unhappy prince has for many

India. years been subjected, easily enabled the French party among Scindiah's troops to wrest from him the sanction of the imperial name, and the semblance at least of legitimate authority; a matter of some moment, as it served to screen the progress of usurpation. It was accordingly in the vicinity of the capital, and almost in the presence of the dethroned emperor, that the projects of French ambition seemed to tend to maturity with the most steady and rapid course. Considerable advances had already been made towards the formal cession of the important provinces of Agra and Delhi to the French government, and towards their final union with that distant kingdom.

152
Vigorous
government of
Marquis
Wellesly.

Fortunately for the independence of the neighbouring states, and the safety of the British empire, that nobleman who at this critical period had been appointed to the government of India possessed a complete knowledge of the character and views of the French nation. Soon after the arrival of the marquis of Wellesly in the east, his innate penetration, and unwearied industry in acquiring the knowledge of Indian politics, enabled him to discover the whole range and extent of those plans of hostility which the French had meditated in Asia. He was fully apprised of the dangerous situation of the British empire in that quarter of the globe; and with equal promptitude and energy he employed the whole resources of its power in order to avert or repel the danger.

It was, however, at Hyderabad in the Deccan that the impatience and activity of French intrigue first compelled him to meet actual hostility in the field: an insurrection of the French officers there had wrested from the Nizam the whole authority over his army, and in fact, had already converted that faithful and peaceable ally of the British into an open enemy. By a sudden and unexpected movement of a small part of our army, that had been prepared for this purpose, these officers were all suddenly apprehended, and the allegiance of the Nizam, and the subordination of his army, were almost instantaneously restored. This first act of the marquis Wellesly, though scarcely heard of in Europe, certainly augured favourably of his government; for it not only paved the way to his subsequent success against the Mysore, but from its promptitude and decision it deserved to be ranked among the most meritorious measures of his whole administration.

The vengeance of the king of Mysore, for his former losses and defeats, had not suffered him to enjoy a moment of tranquillity after the late pacification (D). He had in fact been raising up a Mohammedan confederacy, which was to consist of the grand seignior, the Persian chiefs, the nabob of Oude, and the Nizam; and was intended for a purpose, no less splendid in the eyes of the faithful, than the extirpation, not only of the British, but of all the enemies of Islamism throughout Hindostan. The army of this prince was fully prepared to take the field, but the fortunate event that has

VOL. XI. Part I.

India. just been related, had deprived him of the co-operation of the Nizam, his nearest, and therefore his most efficient ally.

The native princes of India are in general far more prompt in imbibing resentment, and in learning maxims of hostility against their neighbours, than cautious or prudent in their application. Their French instructors were also, at this period, so much intoxicated with the new form which their own government in Europe had assumed, that they had instituted a society, in the capital of Mysore, for the romantic purpose of spreading the doctrine of liberty and equality among the despots and slaves of Asia. The sovereign of Mysore himself was easily persuaded to become an honorary member of this institution, where he appeared among its associates under the name of *Citizen Tippoo*, an appellation perhaps the most awkward and incongruous that had ever been assumed by an eastern despot. The wild and frantic orisons that were daily poured forth in this club, in favour of an imaginary liberty, were constantly accompanied with sentiments of detestation, and vows of eternal hostility, against the British government; its forces were therefore instantly prepared and marched into the field to meet an aggression, which there had been so little care taken to conceal. Past experience had taught the British officers to avoid the pursuit of a native army in its rapid and discursive evolutions in the field; the British, therefore, marched directly towards the capital of the enemy, which fell, but not till two decided victories had been obtained without its walls, and also an obstinate defence had been made in the interior of the city. In this last conflict (E), which was maintained by both the assailants and the natives with equal valour and obstinacy, much blood was spilt, and the lives of many brave men were lost, among the rest that of Tippoo Sultaun, whose body was found, after long search, among heaps of the slain, where he had fallen nobly defending the last bulwark of his kingdom, and where, however unfortunate he may be deemed in other respects, he at last met with a fate not unworthy of his bravery.

153
Fall of Tip-
poo with
his capital.

By the pacification at Hyderabad, the fall of Seringapatam, and the death of Tippoo Sultaun, the Mohammedan branch of the grand confederacy, which the French had raised against the British power in India, was completely broken and finally destroyed. For although the few remaining adherents of the deceased monarch made some desperate efforts for the restoration of his family, these were rendered abortive by the activity and vigilance of those British officers who had been left in charge of the conquered country (F). The campaign against the Mysore was, therefore, completed by a signal act of justice, as creditable to the government of India, as the late brilliant successes had been honourable to the British arms. The greater part of the vanquished territory was restored to the rajah of Mysore, and his ancient family again mounted that throne,

India. from which they had been driven by the treachery and usurpation of Tippoo and his father: nor did the vengeance of the British, though hurled with such destructive rapidity against the most formidable and inveterate of all their enemies, prevent them from affording sympathy and relief to the surviving family of the Mysore kings; ample endowments were set apart for their support, which they still continue to enjoy, with perhaps equal comfort, and certainly with greater security, than in the most prosperous days of the fortunes of their house.

This train of important and successful events took place during the short space of only a few months after the arrival of the marquis of Wellesly, and they certainly entitled his administration to rank with the most active and brilliant that had ever been displayed by any governor of India; according, however, to his views of the state of that country, he must have regarded his labours as scarcely half finished. He saw the immense power of the Mahratta empire still remaining not only unbroken, but daily increasing, and consolidating under the active and unceasing operation of French influence. A French state, as already noticed, of large extent and formidable power, had been framed by the successive labours of Generals de Boyne and Perron, around the capital of India. This nascent power the all-devouring ambition of the new emperor had already grasped as a rich prize, and its destruction became therefore absolutely necessary to the safety of our empire in India, since, amidst all the multiplied aggressions of his neighbours, the usurper had uniformly distinguished the British nation as the marked, though perhaps not the ultimate object of his hostility.

The reduction of a hostile power so immediately in the vicinity of our possessions, might certainly have justified a war; but as no actual aggression had yet been committed in that quarter, it was on the other side of the peninsula that the marquis of Wellesly was again first called upon for the active support of the interests of his government: the danger became at once pressing and immediate by the usurpation of the whole Mahratta power by a single chief; and the cause of the fugitive was identified with our own.

134
No balance
of power
known in
Indian po-
litics.

The politics of India were never so refined, or considerate, as to admit of a balancing system, by which the overgrown power of any individual state might be prevented from endangering the independence of the rest. Hardly any circumstance of common danger has ever been deemed sufficiently urgent, to unite the native princes in the defence of the country even against foreign invasion. During the contest between the British and the king of Mysore, the Mahrattas observed a suspicious neutrality: they gazed on the combatants with an indifference that bordered on fatuity; and which strongly foreboded the dissolution of their state. After the fall of that kingdom, their empire actually fell into a state of anarchy that demanded the most prompt measures of precaution for the safety of the British territories, and those of its allies, which lay around its frontiers. The constitution of their empire, originally ill constructed and undefined, had lately been radically changed. The ancient rajahs of Satarah, who had originally laid the foundation of its power, and extended its influence over the peninsula with such unexampled rapidity, had gradually sunk from the rank

India. of sovereigns to imbecillity, and, owing to the personal ambition of their servants, fell into a station, if not of absolute privacy, at least of complete insignificance.

Their ministers, already become hereditary in their offices, and too powerful for controul, had sufficient influence to remove the seat of government from Satarah, and to constitute the town of Poonah the capital of the empire. There, removed from the eyes of the princes, they no longer deigned to preserve further allegiance, than the semblance of delegated power; they accordingly retained the appellation of Peshwa, but compelled the subordinate members of the confederacy to acknowledge them as the legitimate organ of the whole executive power of the state, whether civil or military. It is, however, scarcely possible, accurately to define either the rights or the power attached to the Peshwa, after his being acknowledged representative of the supreme head of the empire. The extent of his prerogatives seems to have varied at different times, according to the personal talents and ambition of each incumbent in the exercise of this recent power.

Bajee Rao, the present Peshwa, from that imbecillity and indolence which in Asia is so often attached to high station, had devolved upon inferior agents almost the whole of the active duties of his office. His power had frequently been disputed or controlled; he had at different times nearly become a prey to the ambition of the subordinate chiefs; and, at the period now under review, though defended by Scindiah, he had been completely defeated by Holkar's troops, and obliged to flee for security beyond the limits of his own dominions.

The danger to the British possessions, and those of their allies, became pressing and immediate, from this usurpation of almost the whole Mahratta power by the hands of a single chieftain; and the cause of the Peshwa thus became identified with that of our India government.

A treaty of defensive alliance between the India Company and the Peshwa, was therefore drawn up at the earnest solicitation of that prince, and was finally ratified at Bassin, where he had fled from the aggressions of Holkar for protection. By this instrument, it was stipulated, that he should be restored to his dominions, and to the exercise of his legitimate authority, on condition of his maintaining, for the defence of his territories, and at his own expence, a brigade of British troops; which it was at first agreed should consist of 6000, but afterwards the number was increased to 10,000 men.

The terms of this convention were no sooner arranged, than the British army, under Sir Arthur Wellesly, marched towards Poonah with that promptitude and decision which have always distinguished the services of this valuable officer. The rapidity of his movements, and his unexpected advance, saved the capital from destruction; for the troops of Holkar, who had continued to pillage the city, since it fell into their possession, had at last resolved to finish the catastrophe, by setting it on fire. Alarmed, however, by the sudden approach of the British army, they fled from the place with the utmost precipitation, and soon after abandoned the territory of Poonah. Room was thus made for the peace-
able

India. able restoration of the deposed sovereign; and the Peshwa, when he afterwards arrived, was received by his subjects, not merely with submission and quietness, but with every mark of the sincerest joy and satisfaction. During his absence the inhabitants had been subjected to the severest forms of military execution; and forced to submit to the various exactions of a chief the most needy, desperate, and rapacious, of all the leaders of the predatory bands of his countrymen. When, therefore, they again beheld their lawful sovereign, they greeted his return by salutes from all the forts in his kingdom, and testified their joy, by illuminations on the tops and acclivities of the hills throughout the whole vicinity of Poonah.

Thus far the measures of the governor of India wore an aspect of consistency and vigour, which augured well in favour of their ultimate success. The justice of his interference at this time, to check the overgrown power of an aspiring adversary, and to succour the distress of a fallen prince, will hardly be questioned by such as are versant in the politics of India: Nor will it be denied, since all the Mahratta princes exercised the right of making treaties themselves, that the same privilege belonged to the head of the empire.

According to these views, the defensive treaty of Bassein was not only avowed by the parties, but freely communicated to the rest of the chiefs, who explicitly declared, that it contained no stipulations injurious either to the principles of their constitution, or to the just rights of any member of the Mahratta confederacy. On the other hand, its advantages were sufficiently obvious. It had the immediate effect of restoring a deposed prince to his throne, and to the exercise of his acknowledged rights, as well as of checking a dangerous usurpation. It detached from the influence of French councils a very important branch of the Mahratta confederacy, and therefore coincided with the general tendency and spirit of the British policy in the east.

But the power of the Peshwa, and the predominant rights which, by the constitution of the empire, were attached to his office, had, as was already noticed, become a grand object of ambition among the more considerable chiefs. Scindiah had for many years laboured to gain an ascendancy at the court of Poonah, and on some occasions actually possessed a powerful influence on its councils. Ragojee Boonsla had, from family connection, some grounds for the advancement of his own claims to this office; while Holkar had lately, by the fortune of war, had the whole authority placed within his grasp, and in the name of Amrut Rao, brother to the Peshwa, had actually begun to exercise its different prerogatives.

The final deprivation of these chiefs, of so fair an object of ambition as the general controul of the whole Mahratta empire, seemed to reproach their indolence and want of ambition; and the nearer they considered its attainment, the stronger the jealousy and disappointment which its loss occasioned. The deep resentment thus excited among these chiefs, though unacknowledged by themselves, was the true cause of that open hostility which they were now about to commence against the British power. Thus impelled by the strong emotions of disappointed ambition, Scindiah and the rajah of Nagpore entered into a close engagement to frustrate the arrangements lately stipulated by the treaty of Bassein. In order to execute this purpose,

each chief set on foot a large army, which was marched from different quarters to a point of union, bordering on the territories of the Nizam, an ally of the India company.

This menacing position they maintained for a considerable time, in order to complete their own preparations, and the more effectually to urge Holkar to join their confederacy; nor could they be persuaded to abandon it by the strongest remonstrances of our government against military preparations so unnecessary for their own defence, and in a situation so incompatible with the peace and safety of the British allies. However unwilling the marquis of Wellesly might be to hazard the tranquillity and safety of the British empire in the east by entering into a contest with these powerful chiefs, whose dominions actually stretched over more than one-half of the peninsula of India, he had however no alternative left him. The full and positive information which he had from various sources obtained, of the nature and extent of the hostilities that had for some time past been meditated, was now confirmed by the menaces of the enemy, and the actual preparations that he had made to carry them into execution. He foresaw the dangerous crisis which was now so near at hand; and the hollow profession of friendships which were constantly sent in reply to his remonstrances, did not for a moment prevent him from bringing forward the whole resources of his government to defeat their enterprises.

A combination of the Mahratta empire, so extensive and powerful as that now formed by the confederates, had never hitherto been brought into action against the British power; and it must be acknowledged also, that a system of defence, equally prompt, vigorous, and comprehensive, was never planned by any former governor of British India. Five different armies, each of considerable force, were speedily prepared, brought into the field, and ready to invade the vast territory of the enemy, nearly at the same period of time. The value of the previous arrangements that had been formed with the Nizam and the Peshwa, particularly the subsidiary treaties, was now distinctly felt. By them the British army was enabled to proceed through the friendly territories of allied chiefs, to the very boundary of the Mahratta dominions, where it was joined by a large subsidiary force both from Hyderabad and Poonah, which materially promoted the success of the campaign. The marquis thus was enabled to attack the extensive dominions of the enemy, from almost every assailable point, by an effort almost simultaneous.

On the south they were invaded by a powerful division of the Madras army under Sir Arthur Wellesly; in Guzerat, on the west, by Colonel Murray, and a strong detachment of the Bombay troops; a similar effort was also made by General Lake on the northern extremity of Scindiah's dominions, where the main strength of his army was stationed in conjunction with the celebrated brigade of General Perron. On the east, in Bundelcund, the same system of attack was pursued, where the adherents of the confederacy Ali Mohammed and Himmut Bahaudur were overpowered and dispersed. During the execution of all these operations, the provinces of Balasore and Cuttack were wrested from the rajah of Nagpore, by the immediate direction and under the auspices of the governor-gene-

India. ral himself who had planned and combined all these assaults with a degree of judgment and accuracy which secured their uniform success, and which has proved as creditable to his own talents as the prompt execution of his plans has been honourable to our Indian armies. But the circumstance which appears most signally to have promoted the success of this eventful campaign, was the ample and unrestricted authority which was conferred on the different commanders carrying on their operations so far removed from the seat of government. It was thus these officers were enabled to meet every new exigency by the unrestrained application of all their resources, and to surmount or evade unforeseen difficulties, as they happened to arise, by the immediate exercise of discretionary power. The unexampled rapidity of our victories, and vast extent of the conquests that were made in the short space of a few months, must be in some measure also ascribed to that just tribute of commendation which was so impartially and liberally bestowed on the officers and troops after their hard-fought battles. This approbation, equally merited and useful, inspired the army with a just confidence in its own strength, and preserved among the troops uncommon alacrity amidst their fatigues and danger.

The strong partiality which the marquis of Wellesly must have naturally felt for the brilliant services of his brother, on no occasion prevented him from discerning the merits of other officers, and from conferring on them their just share of applause. Immediately after the battle of Delhi, he expresses his sense of the services of General Lake and his army in the following spirited and patriotic terms in his general orders to the troops. He observes, that "on reviewing the rapid successes obtained by our arms within the short space of a few months, every loyal subject of the British empire must be animated with the most zealous emotions of just pride and national triumph. I have already expressed the sentiments of gratitude and admiration with which I contemplated the conduct of his excellency the commander in chief, and his army, in the action of the 29th of August, and in the gallant assault of the fortrefs of Ally Ghur on the 4th of September. The decisive victory gained on the 11th, in the battle of Delhi, justifies the firm confidence I reposed in the bravery, perseverance and discipline of the army, and in the skill, judgment, and invincible intrepidity of their illustrious commander. The glory of that day is not surpassed, by any recorded triumph of the British arms in India; and is attended by every circumstance calculated to elevate the fame of British valour, to illustrate the character of British humanity, and to secure the stability of the British empire in the east."

The bravery of Sir A. Wellesly and his army, their achievements in the memorable battles of Assye and Argaum in the Deccan, were not less conspicuous; nor were the general merits of this officer less worthy of those liberal and manly encomiums which he received from the marquis. Both commanders enjoyed the approbation of their sovereign, and received from him those honours which are the reward of valour. Fortunately too for the interests of the British empire, assailed at this period by the most inveterate of all its enemies, the solid advantages resulting from those well contested battles were not inferior to the splendour of their achievement.

India. Their immediate consequences were the defeat of the combined armies of the confederate chiefs; and, from the loss of their artillery, an irreparable blow to their strength and resources, throughout the whole of the Deccan. These prosperous results were, no doubt, aided and accelerated by the auspicious progress of the army at all the different points from which it invaded the Mahratta empire. Soon after these successes, the French officers attached to Scindiah's army, after having quarrelled with the native sirdars and with each other, abandoned the service of that chief: after the example of Perron their principal partizan, they submitted to the protection of the British commander, who suffered them to retire with whatever property they had acquired, and had been able to bring away.

Thus the grand fabric of French power which that nation had been anxiously raising up, with the assumed sanction of the imperial authority, and the more efficient support of the Mahratta power, was at last broken down, and completely destroyed throughout the whole of India. The conquest of Balafore and Cuttack by Colonel Harcourt seemed well calculated to prevent its future renovation; for it connected the two presidencies of Bengal and Madras, and united the British territories along the whole extent of the Coromandel coast, where they now present an unbroken and hostile frontier against every inroad from the shore, and form a barrier against the introduction of French supplies, and officers to discipline the armies of every inimical power.

The strong detachment of the Bombay army under Colonel Murray, though engaged in enterprises apparently less splendid, were equally serviceable in promoting the important results of the campaign. This officer not only defended the coast and British territory in that quarter, and those of our ally the Guickerajah; but he also reduced the fortresses of Broach, Powanghur, and other posts of importance. Thus, in every quarter of this extended warfare, was the British cause triumphant;—on the shores of Guzerat and Balafore, on the mountains of the Deccan, and in the plains of Delhi, her banners were supported with equal energy and spirit; and victory everywhere continued steadily to follow them.

In the space of a few months, a rapid succession of events had taken place, of sufficient importance to change completely the relative condition of the British empire, and the different powers of India. Its power was enlarged; and its ascendancy among the neighbouring states was without controul. Seven hundred pieces of cannon had been taken from the enemy; their armies routed and dispersed. Eight fortresses had been reduced, either by siege or by escalade. The mighty strength of the French and Mahratta confederacy had been suddenly crushed throughout a territory extending over 1000 miles square. What seemed, however, of no less importance, in these warlike times, and in the critical situation of the British empire, then attacked and threatened with invasion, by its most powerful and inveterate enemy in Europe; her military reputation was heightened; the laurels she had lately gathered in Syria and Egypt were refreshed; and she enjoyed a satisfactory proof, that amidst increasing luxury and imminent danger, no portion of the enterprise and valour of her armies had been lost. Nor is it to be forgotten

India. gotten that all her late victories in the east, had been obtained over troops, not in the ordinary circumstances of Indian armies. They had been disciplined by European officers, and led with intrepidity and skill. The proficiency they had made in European tactics was so great, that during the action at Assye, the Mahrattas made no less than five different changes of position, and sustained on the same day an equal number of assaults, before they yielded the contest. It was by the point of the bayonet alone, that they were at last compelled to relinquish their guns; 100 of which were taken on the field of battle, by an army scarcely amounting to a tenth-part of the number of that which they had, with such singular bravery, driven from the field.

179
peace con-
cluded. The Mahratta confederacy being finally subdued, a peace was concluded between the India Company, Dowlut Rao Scindiah, and the Berar rajah, in January 1804. The short period of tranquillity that succeeded this event, was speedily interrupted by Holkar, another powerful chief, whose expulsion of the Peshwa had originally occasioned the war. This prince, though he kept aloof from the confederacy of his countrymen, with an indifference which seemed to argue at once a deficiency of patriotism and a want of sound policy, was, nevertheless, found to maintain the contest for his independence with far greater skill and bravery than any prince whom the British arms had opposed in India.

The power and resources of Holkar had gradually been increased, like that of the other chiefs, by the introduction of European officers into his army, and by an improved system of discipline which was thus established. Thus formidable itself, his power was rendered almost unassailable, from the nature of his country, which is uncommonly mountainous, and, during the rains, impassable from jungles and morasses. His skill in maintaining the predatory warfare, so congenial to a Mahratta army, was far superior to that of the other chiefs; whose experience had so fully taught him the danger of risking any regular engagement with European troops. Thus, although his territories were invaded on all sides by detachments of the company's forces, he constantly eluded their attacks; and by the singular rapidity of his movements, he was enabled suddenly to assemble almost his whole force, and overpower whatever detachments he might find at a distance from support. In this situation, the troops under Colonel Monson were surprised. This officer had marched against his capital Indoor, in concert with Colonel Murray, who had reached the place from Bombay, and captured it without much opposition. His less fortunate coadjutor, however, after being betrayed by his guides, and deserted by a part of his troops, was attacked by a superior force, under Holkar himself, before which he was forced to retreat towards Agra, through a country impassable from the rains, and destitute of provisions. After several disastrous conflicts, during a retreat of seven weeks, which degenerated into a flight, the greater part of his guns, and the whole of the baggage and military stores, were lost. A few only of the troops reached Agra at midnight, in a state of extreme distress; the greater part had been overtaken in their flight, and were either massacred, or cruelly mutilated, by their ferocious pursuers.

Colonel Willot of the Bengal artillery was almost

India. equally unsuccessful in an attack which he had planned against a strong post in the interior: he failed in the attempt; and soon after died of the wounds he had received. It was in Bundelcund, and the country of the Rohillas, that Holkar received the most considerable checks, which produced a reverse of fortune. From both those territories he was completely driven by Lieutenant-colonel Fawcett and General Smith.

Parties of his cavalry had been repeatedly defeated by Lord Lake: but the rapidity of their movements as often saved them from destruction; and it was not till the decisive battle of Deeg, on the 13th of November, that the main strength of this enterprising chief was completely broken. At this place, his army, trusting to the great strength of its position, behind successive ranges of batteries, was induced to hazard a general action. From these different batteries, which extended to the depth of two miles, they were successively driven by the gallant General Frazer, who had the credit of forcing a post which had been deemed impregnable; and which at this period was defended by 24 battalions of infantry, and 150 pieces of cannon.

In this brilliant achievement the general was wounded in the leg, and soon after was obliged to be carried off the field. The completion of the victory thus fell to Colonel Monson, who now saw complete vengeance inflicted for his past disasters, and for the unexampled cruelty of his enemy; 2000 of whom were killed, either in the battle or during the retreat. An immense number was wounded, and among those many considerable chiefs; while 87 pieces of cannon fell into his hands, which partly consisted of the same guns which he had himself lost during his disastrous retreat to Agra.

Had Holkar confided merely to his effective force in the field, his cause might have now been regarded as desperate. His boldness, however, and his unexampled success, had gained him the support of several of the native princes. Among these he had seduced the rajah of Bhurtpore, an ally of the British, and the chief of the celebrated cast of the Jauts, the most warlike tribe in upper India. General Lake was therefore obliged to concentrate his army, and to employ it in the reduction of Bhurtpore, a fortress which experience has proved to have been the strongest and most impregnable in the whole peninsula. While thus employed, the dispersed troops of Holkar had time to rendezvous in distant quarters; and were successful in cutting off his supplies of provisions, and in plundering the surrounding districts, by that predatory mode of warfare, for which the Mahrattas have always been celebrated.

The reduction of Bhurtpore, thus defended by the indefatigable efforts of Holkar, by its intrepid garrison, and its own natural strength, proved the most arduous enterprise which the British troops had ever undertaken in Asia. The success of the besieged in repelling four different assaults, animated them with fresh courage and intrepidity. The rajah and his whole tribe, were united by the ties of blood, as well as of civil authority. They had claim to a high *cost* among the natives, which they knew must be forfeited forever by unconditional submission: Unfortunately these were the only terms which General Lake, in the peremptory instructions which were given for its reduction, was permitted to accept. The rajah, therefore, having collected in the

India. the fort, his women, his children, and his treasures, resolved to bury them all with himself under its ruins, rather than submit to terms which were deemed as disgraceful to his religion and his rank, as they were mortifying to his feelings as a soldier.

Compelled by the orders of his superior, and undaunted by all the past disasters which the troops had already suffered, General Lake resolved to hazard another attempt. In the account given of it in his dispatch to the governor-general, dated 22d February, he observes, that "it appeared our failure on the 20th was to be accounted for, in a great measure, by the occurrence of unexpected accidents and delays, as part of the corps who formed the storming party had surmounted the principal difficulty, and had nearly gained the summit of the bastion; where, I was informed, a few hours more battering would make the ascent perfectly easy, I determined to make another attempt yesterday.

"The party for this service consisted of the whole European force, and the two battalions of the native infantry of the Bengal army; and the greater part of his majesty's 55th and 86th regiments, the grenadier battalion, and the flank companies of the 1st battalion 3d regiment, from the Bombay division. The whole moved on to the attack about three o'clock in the afternoon, under the command of the honourable Brigadier Monson. The troops, most confident of success, commenced the attack, and persevered in it for a considerable time, with the most determined bravery; but their utmost exertions were not sufficient to enable them to gain the top of the breach. The bastion, which was the point of attack, was extremely steep; the resistance opposed to them was vigorous, and as our men could only mount by small parties at a time, the advantages were very great on the side of the enemy. Discharges of grape, logs of wood, and pots filled with combustible materials, immediately knocked down those who were ascending; and the whole party, after having engaged in an obstinate contest for two hours, and suffering very severe loss, was obliged to relinquish the attempt, and to retire to our trenches." The loss of the British army in this last assault, and that of the 20th, amounted to 300 killed, and 1564 wounded: its whole loss during the different attacks, amounted to upwards of 3000 of the bravest of our troops; while the unconditional surrender of the place, though the ultimate object of all these perilous attempts, was never attained.

The rajah, however, again proposed the terms he had formerly offered; and consented to pay three lacks of rupees to the army, and the expences of the war. Hostages were given for the regular discharge of these sums, at different instalments. Thus the last prince in India who resisted the British arms, was found to have made the most glorious defence of his independence, and to have secured for himself the most honourable terms. Holkar himself, after having been often beaten, was at last deserted by almost the whole of his troops, and was obliged to escape with a retinue so scanty, as was hardly sufficient for the protection of his person. In this manner, an arduous campaign of 11 months was completed, after occasioning a greater loss of blood and treasure than had, perhaps, ever been incurred by the subjugation of any single chief. Nor did this daring and magnanimous prince deign to tender

submission, or to sue for peace, till the marquis of Wellesley had returned to Europe; till he had beheld the downfall of all the leading men of his nation; and till, like another Galgacus, he had secured to himself the honour of being the last prince who had dared to uphold the standard of independence in his native country.

Thus ended the contest between the British government and the Mahratta states;—a combination of military chiefs who had suddenly emerged from obscurity, and rose to the highest rank among the native powers. Their growing influence had invariably been hostile both to the Mohammedan and British power. Their vicinity was the fertile source of intrigue, stratagem, and war: By their downfall, the India Company has obtained a full ascendancy over the peninsula; time and future experience will shew whether this new authority shall better promote the peace and prosperity of that populous country.

INDICATION, in *Physic*, whatever serves to direct the physician how to act.

INDICATIVE, in *Grammar*, the first mood or manner of conjugating a verb, by which we simply affirm, deny, or ask something: as, *amant*, "they love;" *non amant*, "they do not love;" *amant æ?* "do they love?" See GRAMMAR.

INDICTION, in *Chronology*, a cycle of 15 years. See CYCLE.

INDICTMENT, in *Law*, one of the modes of prosecuting an offender. See PROSECUTION.

In English law, it is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and presented upon oath by, a grand jury. To this end, the sheriff of every county is bound to return to *Blackst.* every session of the peace, and every commission of *oyer Comment.* and *terminer*, and of general gaol-delivery, twenty-four good and lawful men of the county, some out of every hundred, to inquire, present, do, and execute all those things, which on the part of our lord the king shall then and there be commanded them. They ought to be freeholders; but to what amount is uncertain: which seems to be *casus omiffus*, and as proper to be supplied by the legislature as the qualifications of the petit jury; which were formerly equally vague and uncertain, but are now settled by several acts of parliament. However, they are usually gentlemen of the best figure in the county. As many as appear upon this pannel, are sworn upon the grand jury, to the amount of twelve at the least, and not more than twenty-three; that twelve may be a majority. Which number, as well as the constitution itself, we find exactly described so early as the laws of King Ethelred: *Wilk. & L. Ann. Let. 117.* *Excant seniores duodecim thani, et præfatus cum eis, ut jurent*

indictment. jurent super sanctuarium quod eis in manus datur, quod nolint ullum innocuum accusare, nec aliquem noxium celare. In the time of King Richard I. (according to Hoveden), the process of electing the grand jury, ordained by that prince, was as follows: Four knights were to be taken from the county at large, who chose two more out of every hundred; which two associated to themselves ten other principal freemen, and those twelve were to answer concerning all particulars relating to their own district. This number was probably found too large and inconvenient; but the traces of this institution still remain, in that some of the jury must be summoned out of every hundred. This grand jury are previously instructed in the articles of their inquiry, by a charge from the judge who presides upon the bench. They then withdraw to sit and receive indictments, which are preferred to them in the name of the king, but at the suit of any private prosecutor; and they are only to hear evidence on behalf of the prosecution: for the finding of an indictment is only in the nature of an inquiry or accusation, which is afterwards to be tried and determined; and the grand jury are only to inquire upon their oaths, whether there be sufficient cause to call upon the party to answer it. A grand jury, however, ought to be thoroughly persuaded of the truth of an indictment, so far as their evidence goes; and not to rest satisfied merely with remote probabilities: a doctrine that might be applied to very oppressive purposes.

The grand jury are sworn to inquire only for the body of the county, *pro corpore comitatus*; and therefore they cannot regularly inquire of a fact done out of that county for which they are sworn, unless particularly enabled by act of parliament. And to so high a nicety was this matter anciently carried, that where a man was wounded in one county, and died in another, the offender was at common law indictable in neither, because no complete act of felony was done in any one of them: but by statute 2d and 3d Edw. VI. c. 24. he is now indictable in the county where the party died. And, by statute 2 Geo. II. c. 21. if the stroke or poisoning be in England, and the death upon the sea or out of England, or *vice versa*, the offenders, and their accessories, may be indicted in the county where either the death, poisoning, or stroke, shall happen. And so in some other cases; as particularly, where treason is committed out of the realm, it may be inquired of in any county within the realm, as the king shall direct, in pursuance of statutes 26 Hen. VIII. c. 13. 33.; Hen. VIII. c. 23. 35.; Hen. VIII. c. 2. 5. 6.; Edw. VI. c. 11. And counterfeiters, wafers, or minsters, of the current coin, together with all manner of felons and their accessories, may, by statute 26 Hen. VIII. c. 6. (confirmed and explained by 34 and 35 Hen. VIII. c. 26. § 75. 76.) be indicted and tried for those offences, if committed in any part of Wales, before the justices of gaol-delivery and of the peace, in the next adjoining county of England, where the king's writ runneth: that is, at present in the county of Hereford or Salop; and not, as it should seem, in the county of Chester or Monmouth: the one being a county palatine where the king's writ did not run; and the other a part of Wales, in 26 Hen. VIII. Murders also, whether committed in England or in foreign parts, may, by virtue of the statute 33 Hen. VIII. c. 23. be inquir-

red of and tried by the king's special commission in any *indictment-*shire or place in the kingdom. By statute 10 and 11 W. III. c. 25. all robberies, and other capital crimes, committed in Newfoundland, may be inquired of and tried in any county in England. Offences against the black act, 9 Geo. I. c. 22. may be inquired of and tried in any county of England, at the option of the prosecutor. So felonies, in destroying turnpikes, or works upon navigable rivers, created by authority of parliament, may, by statutes 8 Geo. II. c. 20. and 13 Geo. III. c. 84. be inquired of and tried in any adjacent county. By statute 26 Geo. II. c. 19. plundering or stealing from any vessel in distress or wrecked, or breaking any ship contrary to 12 Ann. statute 2. c. 18. may be prosecuted either in the county where the fact is committed, or in any county next adjoining; and if committed in Wales, then in the next adjoining English county: by which is understood to be meant, such English county as, by the statute 26 Hen. VIII. above mentioned, had before a concurrent jurisdiction of felonies committed in Wales. Felonies committed out of the realm, in burning or destroying the king's ships, magazines, or stores, may, by statute 12 Geo. III. c. 24. be inquired of and tried in any county of England, or in the place where the offence is committed. By statute 13 Geo. III. c. 63. misdemeanors committed in India may be tried upon information or indictment in the court of king's-bench in England; and a mode is marked out for examining witnesses by commission, and transmitting their depositions to the court. But, in general, all offences must be inquired into, as well as tried, in the county where the fact is committed. Yet if larceny be committed in one county, and the goods carried into another, the offender may be indicted in either; for the offence is complete in both. Or he may be indicted in England for larceny in Scotland, and carrying the goods with him into England, or *vice versa*; or for receiving in one part of the united kingdom goods that have been stolen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goods is a continuation of the original taking, and is therefore larceny in the second county, yet it is not a robbery or burglary in that jurisdiction. And if a person be indicted in one county for larceny of goods originally taken in another, and be thereof convicted, or stands mute, he shall not be admitted to his clergy; provided the original taking be attended with such circumstances as would have outled him of his clergy by virtue of any statute made previous to the year 1691.

When the grand jury have heard the evidence, if they think it a groundless accusation, they used formerly to endorse on the back of the bill, *Ignoramus*; or, We know nothing of it: intimating, that though the facts might possibly be true, that truth did not appear to them. But now they assert in English more absolutely, *Not a true bill*; or (which is the better way) *Not found*; and then the party is discharged without farther answer. But a fresh bill may afterwards be preferred to a subsequent grand jury. If they are satisfied of the truth of the accusation, they then endorse upon it, "A true bill;" anciently, *Billa vera*. The indictment is then said to be found, and the party stands indicted. But to find a bill, there must at least

twelve of the jury agree: for so tender is the law of England of the lives of the subjects, that no man can be convicted at the suit of the king of any capital offence, unless by the unanimous voice of twenty-four of his equals and neighbours; that is, by twelve at least of the grand jury, in the first place, assenting to the accusation; and afterwards by the whole petit jury of twelve more, finding him guilty upon his trial. But if twelve of the grand jury assent, it is a good presentment, though some of the rest disagree. And the indictment, when so found, is publicly delivered into court.

Indictments must have a precise and sufficient certainty. By statute 1 Hen. V. c. 5. all indictments must set forth the Christian name, surname, and addition of the state and degree, mystery, town, or place, and the county of the offender; and all this to identify his *person*. The *time* and *place* are also to be ascertained, by naming the day and township in which the fact was committed: though a mistake in these points is in general not held to be material, provided the *time* be laid previous to the finding of the indictment, and the *place* to be within the jurisdiction of the court; unless where the place is laid, not merely as a *venue*, but as part of the description of the fact. But sometimes the *time* may be very material, where there is any limitation in point of time assigned for the prosecution of offenders; as by the statute 7 Will. III. c. 3. which enacts, that no prosecution shall be had for any of the treasons or misdemeanors therein mentioned (except an assassination designed or attempted on the person of the king), unless the bill of indictment be found within three years after the offence committed: and, in case of murder, the time of the death must be laid within a year and a day after the mortal stroke was given. The offence itself must also be set forth with clearness and certainty; and in some crimes particular words of art must be used, which are so appropriated by the law to express the precise idea which it entertains of the offence, that no other words, however synonymous they may seem, are capable of doing it. Thus, in treason, the facts must be laid to be done "treasonably, and against his allegiance;" anciently, *proditoriè et contra ligeantia sua debitum*; else the indictment is void. In indictments for murder, it is necessary to say that the party indicted "murdered," not "killed" or "slew," the other; which, till the late statute, was expressed in Latin by the word *murdravit*. In all indictments for felonies, the adverb "feloniously," *felonicè*, must be used; and for burglaries also, *burglariter*, or, in English, "burglariously;" and all these to ascertain the intent. In rapes, the word *rapuit*, or "ravished," is necessary, and must not be expressed by any periphrasis, in order to render the crime certain. So in larcenies also, the words *felonicè cepit et asportavit*, "feloniously took or carried away," are necessary to every indictment; for these only can express the very offence. Also, in indictments for murder, the length and depth of the wound should in general be expressed, in order that it may appear to the court to have been of a mortal nature: but if it goes through the body, then its dimensions are immaterial, for that is apparently sufficient to have been the cause of the death. Also, where a limb, or the like, is absolutely cut off, there such description is need-

less. Lastly, in indictments, the *value* of the thing which is the subject or instrument of the offence must sometimes be expressed. In indictments for larcenies this is necessary, that it may appear whether it be grand or petit larceny; and whether entitled or not to the benefit of clergy. In homicides of all sorts it is necessary; as the weapon with which it is committed is forfeited to the king as a deadand. For the manner of process upon an indictment, see PROCESS.

INDICTMENT, in *Scots Law*, the name of the summons, or libel, upon which criminals are cited before the court of judicary to stand trial. See LAW INDEX.

Plea to INDICTMENT. See PLEA.

INDIES, East and West. See INDIA and AMERICA.

INDIGENOUS, of *indigena*, denotes a native of a country, or that which was originally born or produced in the country where it is found. In this sense, particular species of animals and plants are said to be *indigenous* in the country where they are native, in opposition to EXOTIC.

INDIGESTION, a crudity or want of due coction of the food in the stomach. See DIGESTION.

INDIGETES, a name which the ancients gave to some of their gods.

There are various opinions about the origin and signification of this word. Some pretend it was given to all the gods in general; and others, only to the demigods, or great men deified. Others say, it was given to such gods as were originally of the country, or rather such as were the gods of the country that bore this name; and others again hold it was ascribed to such gods as were patrons and protectors of particular cities. Lastly, others hold *indigetes* to be derived from *inde genitus* or *in loco degens*, or from *inde* and *ago*, for *dego*, "I live, I inhabit;" which last opinion seems the most probable.

In effect it appears, 1. That these *indigetes* were also called *local gods* (*dii locales*), or *topical gods*, which is the same thing. 2. The *indigetes* were ordinarily men deified, who indeed were in effect local gods, being esteemed the protectors of those places where they were deified; so that the second and third opinions are very consistent. 3. Virgil joins *patrii* with *indigetes*, as being the same thing, *Georg. i. ver. 498.* "*Dii patrii, indigetes.*" 4. The gods to whom the Romans gave the name *indigetes* were, Faunus, Vesta, Æneas, Romulus, all the gods of Italy; and at Athens, Minerva, says Servius; and at Carthage, Dido. It is true, we meet with Jupiter *indiges*: but that Jupiter *indiges* is Æneas, not the great Jupiter; as we may see in Livy, lib. i. cap. 3. in which last sense Servius assures us, *indiges* comes from the Latin *in diis ago*, "I am among the gods."

Among these *indigetes* gods, there is none more celebrated, nor more extensively worshipped, than HERCULES.

INDIGO, a dye prepared from the leaves and small branches of the *Indigofera Tinctoria*. See the next article.

INDIGOFERA, the INDIGO PLANT, a genus of plants belonging to the diadelphia class; and in the natural method ranking under the 32d order, *Papilionacea*. See BOTANY INDEX.

Indigofera. This plant requires a smooth rich soil, well tilled, and not too dry. The seed of it, which, as to figure and colour, resembles gunpowder, is sown in little furrows that are about the breadth of the hoe, two or three inches deep, at a foot's distance from each other, and in a straight line as possible. Continual attention is required to pluck up the weeds, which would soon choke the plant. Though it may be sown in all seasons, the spring is commonly preferred. Moisture causes this plant to shoot above the surface in three or four days. It is ripe at the end of two months. When it begins to flower, it is cut with pruning-knives; and cut again at the end of every six weeks, if the weather is a little rainy. It lasts about two years, after which term it degenerates; it is then plucked up, and planted afresh. As this plant soon exhausts the soil, because it does not absorb a sufficient quantity of air and dew to moisten the earth, it is of advantage to the planter to have a vast space which may remain covered with trees, till it becomes necessary to fell them in order to make room for the indigo.

Indigo is distinguished into two kinds, the *true* and the *bastard*. Though the first is sold at a higher price on account of its superiority, it is usually advantageous to cultivate the other, because it is heavier. The first will grow in many different soils; the second succeeds best in those which are most exposed to the rain. Both are liable to great accidents. Sometimes the plant becomes dry, and is destroyed by an insect frequently found on it; at other times, the leaves, which are the valuable part of the plant, are devoured in the space of 24 hours by caterpillars. This last misfortune, which is but too common, has given occasion to the saying, "that the planters of indigo go to bed rich, and rise in the morning totally ruined."

This production ought to be gathered in with great precaution, for fear of making the farina that lies on the leaves, and is very valuable, fall off by shaking it. When gathered, it is thrown into the steeping-vat, which is a large tub filled with water. Here it undergoes a fermentation, which in 24 hours at furthest is completed. A cock is then turned, to let the water run into the second tub, called the *mortar* or *pounding tub*. The steeping-vat is then cleaned out, that fresh plants may be thrown in; and thus the work is continued without interruption.

The water which has run into the pounding-tub is found impregnated with a very subtle earth, which alone constitutes the dregs or blue substance that is the object of this process, and which must be separated from the useless salt of the plant, because this makes the dregs swim on the surface. To effect this, the water is forcibly agitated with wooden buckets, that are full of holes and fixed to a long handle. This part of the process requires the greatest precautions. If the agitation be discontinued too soon, the part that is used in dyeing, not being sufficiently separated from the salt, would be lost. If, on the other hand, the dye were to be agitated too long after the complete separation, the parts would be brought together again, and form a new combination; and the salt reacting on the dregs would excite a second fermentation, that would alter the dye, spoil its colour, and

make what is called *burnt indigo*. These accidents are prevented by a close attention to the least alterations that the dye undergoes, and by the precaution which the workmen take to draw out a little of it from time to time in a clean vessel. When they perceive that the coloured particles collect by separating from the rest of the liquor, they leave off shaking the buckets, in order to allow time to the blue dregs to precipitate to the bottom of the tub, where they are left to settle till the water is quite clear.—Holes made in the tub, at different heights, are then opened one after another, and this useless water is let out.

The blue dregs remaining at the bottom having acquired the consilience of a thick muddy liquid, cocks are then opened, which draw it off into the settler. After it is still more cleared of much superfluous water in this third and last tub, it is drained into sacks; from whence, when water no longer filters through the cloth, this matter, now become of a thicker consilience, is put into chests, where it entirely loses its moisture. At the end of three months the indigo is fit for sale.

It is used, in washing, to give a bluish colour to linen: painters also employ it in their water-colours; and dyers cannot make fine blue without indigo. The ancients procured it from the East Indies; in modern times, it has been transplanted into America. The cultivation of it, successively attempted at different places, appears to be fixed at Carolina, St Domingo, and Mexico. That which is known under the name of *Guatemala indigo*, from whence it comes, is the most perfect of all.

There are two kinds of indigo prepared in the East Indies, particularly on the coast of Coromandel, at Pondicherry, &c. Of these the worst kind is used for giving the body of colour to the dyed substance, the other being employed only to give it a gloss afterwards. The finest is prepared on the coast of Agra, Masulipatam, and Ayanoo, but especially in the island of Java; but this last, being extremely dear, is very little used by the dyers. The best ought to float on the surface of water; its colour ought to be a very dark blue inclining to violet, bright and sparkling, especially when broken. It may be tried by dissolving a little in a glass of water: if pure, it will mix equably with the liquor; but if otherwise, will separate and fall to the bottom. Another method of trying the goodness of this substance is by fire; for the pure indigo will be entirely consumed, while the extraneous particles will remain. The pounded indigo is much more subject to adulteration than such as is sold in cakes or tablets; as the ashes or dirt with which it is mixed are very apt to separate from the pure colouring substance when standing in a liquid state, as it must always do before the moisture is evaporated: whence, on breaking a bit of indigo so adulterated, the extraneous matter will be perceived in strata of a different colour.

INDIVIDUAL, a particular being of any species, or that which cannot be divided into two or more beings equal or alike.

The usual division in logic is made into *genera*, or into *genuses*; those *genera* into *species*; and those *species* into *individuals*.

Indivisible
Indulgen-
ces.

INDIVISIBLE, among metaphysicians.—A thing is said to be absolutely *indivisible* that is a simple being, and consists of no parts into which it may be divided. Thus, God is *indivisible* in all respects; as is also the human mind; not having extension, or other properties of body.

INDIVISIBLES, in *Geometry*, the elements or principles into which any body or figure may be ultimately resolved; which elements are supposed to be infinitely small: thus, a line may be said to consist of points, a surface of parallel lines, and a solid of parallel and similar surfaces.

INDORSEMENT, in *Law*, any thing written on the back of a deed; as a receipt for money received.

There is likewise an *indorsement*, by way of assignment, on bills of exchange and notes of hand; which is done by writing a person's name on the back thereof.

INDOSTAN, or **HINDOSTAN**, PROPER INDIA, or the *Empire of the Great Mogul*. See **HINDOSTAN**.

INDUCTION, in *Logic* and *Rhetoric*, a consequence drawn from several propositions or principles first laid down. See **LOGIC**; and **ORATORY**, N^o 32.

INDUCTION, in *Law*, is putting a clerk or clergyman in possession of a benefice or living to which he is collated or presented. See the article **PARSON**.—Induction is performed by a mandate from the bishop to the archdeacon, who usually issues out a precept to other clergymen to perform it for him. It is done by giving the clerk corporal possession of the church, as by holding the ring of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the parishioners due notice and sufficient certainty of their new minister, to whom their tithes are to be paid. This therefore is the investiture of the temporal part of the benefice, as institution is of the spiritual. And when a clerk is thus presented, instituted, and inducted into a rectory, he is then, and not before, in full and complete possession; and is called in law *persona impersonata*, or *parson impersonnee*.

INDULGENCES, in the Romish church, are a remission of the punishment due to sins, granted by the church, and supposed to save the sinner from purgatory.

According to the doctrine of the Romish church, all the good works of the saints over and above those which were necessary towards their own justification, are deposited, together with the infinite merits of Jesus Christ, in one inexhaustible treasury. The keys of this were committed to St Peter, and to his successors the popes, who may open it at pleasure, and by transferring a portion of this superabundant merit to any particular person, for a sum of money, may convey to him either the pardon of his own sins, or a release for any one in whom he is interested, from the pains of purgatory. Such indulgences were first invented in the 11th century, by Urban II. as a recompense for those who went in person upon the glorious enterprise of conquering the Holy Land. They were afterwards granted to those who hired a soldier for that purpose; and in process of time were bestowed on such as gave money for accomplishing any pious work enjoined by the pope.

The power of granting indulgences has been greatly abused in the church of Rome. Pope Leo X. in order to carry on the magnificent structure of St Peter's at Rome, published indulgences, and a plenary remission, to all such as should contribute money towards it. Finding the project take, he granted to Albert elector of Mentz, and archbishop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out those of other countries to the highest bidders; who, to make the best of their bargain, procured the ablest preachers to cry up the value of the ware. The form of these indulgences was as follows: "May our Lord Jesus Christ have mercy upon thee, and absolve thee by the merits of his most holy passion. And I, by his authority, that of his blessed apostles Peter and Paul, and of the most holy Pope, granted and committed to me in these parts, do absolve thee, first from all ecclesiastical censures, in whatever manner they have been incurred; then from all thy sins, transgressions, and excesses, how enormous soever they may be, even from such as are reserved for the cognizance of the holy see, and as far as the keys of the holy church extend: I remit to you all punishment which you deserve in purgatory on their account; and I restore you to the holy sacraments of the church, to the unity of the faithful, and to that innocence and purity which you possessed at baptism; so that when you die, the gates of punishment shall be shut, and the gates of the paradise of delight shall be opened: and if you shall not die at present, this grace shall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghost."

The terms in which the retailers of indulgences described their benefits and the necessity of purchasing them, are so extravagant, that they appear almost incredible. If any man (said they) purchases letters of indulgence, his soul may rest secure with respect to its salvation. The souls confined in purgatory, for whose redemption indulgences are purchased, as soon as the money tinkles in the chest, instantly escape from that place of torment, and ascend into heaven. That the efficacy of indulgences was so great, that the most heinous sins, even if one should violate (which was impossible) the mother of God, would be remitted and expiated by them, and the person be freed both from punishment and guilt. That this was the unspeakable gift of God, in order to reconcile men to himself. That the cross erected by the preachers of indulgences was equally efficacious with the cross of Christ itself. "Lo! the heavens are open; if you enter not now, when will you enter? For twelve pence you may redeem the soul of your father out of purgatory; and are you so ungrateful, that you will not rescue your parent from torment? If you had but one coat, you ought to strip yourself instantly, and sell it, in order to purchase such benefits," &c.

It was this great abuse of indulgences that contributed not a little to the first reformation of religion in Germany, where Martin Luther began first to declaim against the preachers of indulgences, and afterwards against indulgences themselves: but since that time the popes have been more sparing in the exercise of this power: however, they still carry on a great trade

Robertson's
Charles: V
vol. ii. 89.

Indulgen-
ces.

trade with them to the Indies, where they are purchased at two rials a-piece, and sometimes more.

The pope likewise grants indulgences to persons at the point of death; that is, he grants them, by a brief, power to choose what confessor they please, who is authorized thereby to absolve them from all their sins in general.

INDULT, in the church of Rome, the power of preferring to benefices granted to certain persons by the pope. Of this kind is the indult of kings and sovereign princes in the Romish communion, and that of the parliament of Paris granted by several popes. By the concordat for the abolition of the pragmatic sanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to bishoprics, and other consistorial benefices, within his realm. At the same time, by a particular bull, the pope granted him the privilege of nominating to the churches of Brittany and Provence. In 1648 Pope Alexander VIII. and in 1668 Clement IX. granted the king an indult for the bishoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munster; and in 1668 the same Pope Clement IX. granted him an indult for the benefices in the counties of Roussillon, Artois, and the Netherlands. The cardinals likewise have an indult granted them by agreement between Pope Paul IV. and the sacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free disposal of all the benefices depending on them, and are empowered likewise to bestow a benefice *in commendam*.

INDULTO, a duty, tax, or custom, paid to the king of Spain for all such commodities as are imported from the West Indies in the galleons.

INDUS, a large river of Asia, which rises in the mountains which separate Tartary from India, and discharges itself into the Indian ocean. See **HINDOSTAN** and **INDIA**.

INEBRIANTS, are defined to be such things as affect the nerves in a particular and agreeable manner, and through them alter and disturb the functions of the mind. They are properly divided into native and artificial; the former chiefly in use among the oriental and other nations, the latter principally throughout Europe.

Natural Inebriants, are, 1. Opium; in use all over the east, and of which the Turks, through custom, swallow a drachm. 2. Peganum harmala, Syrian rue. The seeds are sold in Turkey for this purpose; and with these, as Bellonius relates, the Turkish emperor Solymán kept himself intoxicated. 3. Mastic of the Turks, or bangué of the Persians; prepared from the dust of the male-flower of hemp, or from the leaves. 4. Bangué of the Indians, from the leaves of the hibiscus sabdariffa. 5. Seeds of various species of the datura, or thorny apple. 6. Pinang, or betel of the Indians. 7. Roots of black henbane. 8. The hyoscyamus physaloides. 9. Berries of the deadly nightshade. 10. Leaves of millfoil, are used by the Dalekarians to render their beer intoxicating. 11. Tobacco, and several others less material are mentioned; such as clary, saffron, and darnel.

Artificial Inebriants, are fermented liquors from fari-

naceous seeds; wines, and spirits drawn by distillation. With these is ranked the nectar of the gods, and the anodyne medicine of Homer, commonly called *nepe-thes*; and the spells by which Medea and Circe produced their enchantments.

INERTIA of MATTER, in *Philosophy*, is defined by Sir Isaac Newton to be a passive principle by which bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. It is also defined by the same author to be a power implanted in all matter, whereby it resists any change endeavoured to be made in its state. See **MECHANICS**.

INESSE is applied to things which are actually existing.

Authors make a difference between a thing *in esse*, and a thing *in posse*: a thing that is not, but may be, they say is *in posse*, or *potentia*; but a thing apparent and visible, they say is *in esse*, that is, has a real being *eo instanti*; whereas the other is casual, and at best but a possibility.

INFALISTACIO, an ancient punishment of felons, by throwing them among the rocks and sands, customarily used in port-towns. It is the opinion of some writers, that *infaliflatus* did imply some capital punishment, by exposing the malefactor upon the sand till the next tide carried him away; of which custom, it is said, there is an old tradition. However, the penalty seems to take its name from the Norman *falese*, or *falesta*, which signified not the sands, but the rocks and cliffs adjoining, or impeding on the sea-shore. *Commisit feloniam ob quam fuit suspensus, utlegatus, vel alio modo morti damnatus, &c. vel apud Dover infaliflatus, apud Southampton submersus, &c.*

INFALLIBLE, something that cannot err, or be deceived.

One of the great controversies between the Protestants and Papists, is the infallibility which the latter attribute to the pope; though, in fact, they themselves are not agreed on that head, some placing this pretended infallibility in the pope and a general council.

INFAMY, in *Law*, is a term which extends to forgery, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even though he is pardoned for his crimes.

INFANCY, the first part of life.—Fred. Hoffman says, that the human species are *infants* until they begin to talk, and *children* to the age of puberty.—Anatomy discovers to us, that during infancy there is much imperfection in the human frame; e. g. its parts are disproportioned, and its organs incapable of those functions which in future life they are designed to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their secretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood sent through the heart of an infant, in a given time, is also more in proportion than in adults. Though these circumstances have their important usefulness, yet the imperfection attending them subjects this age to many injuries and dangers from which a more perfect state is exempted.

Infant

exempted. Dr Percival observes, in his *Essays Med. and Exp* that of all the children who are born alive, two-thirds do not live to be two years old.

Infants have a larger proportion of brain than adults, hence are most subject to nervous disorders; and hence the diagnostics of diseases are in many respects obscure or uncertain, as particularly those taken from the pulse, which, from the irritability of the tender bodies of infants, is suddenly affected by a variety of accidents too numerous, and seemingly too trivial, to gain our attention. However, no very great embarrassment arises to the practitioner from hence: for the disorders in this state are generally acute, less complicated than those in adults, and are more easily discovered than is generally apprehended.

INFANT, denotes a young child. See INFANCY.

INFANTS, among the Jews, Greeks, and Romans, were swaddled as soon as they were born, in a manner similar to that practised by the moderns. The Jews circumcised and named their infant children on the 8th day from the birth. Upon the birth of a son, the Grecians crowned their doors with olive—of a daughter, with wool. The infant was washed in warm water, and anointed with oil—by the Spartans with wine; it was then dressed, and laid in a basket, or on a shield if the father was a warrior, particularly amongst the Spartans. At five days old they ran with it round the fire, and the mother's relations sent presents. The Greeks named their children on the tenth day, the Romans on the ninth: The naming was attended with sacrifices and other demonstrations of joy. The maternal office of suckling their own children was never declined, when circumstances would permit. How much different is this from the unnatural delicacy observed by modern mothers, a delicacy which to the child is cruelty! The 40th day was a day of solemnity for the mother. The names of children were registered both by the Greeks and Romans. See REGISTER.

For an account of the custom of exposing infants, see EXPOSING.

Infants were kept from crying in the streets by means of a sponge soaked in honey. Nurses had also their bugbears and terrible names to frighten the children into peace:—The figure with which they were principally intimidated was *Μογυροϋξισιον*, a sort of raw-head and bloody bones.

INFANT, in *Law*, is a person under 21 years of age; whose capacities, incapacities, and privileges, are various.

1. In *criminal* matters. The law of England does in some cases privilege an infant under the age of 21, as to common misdemeanors; so as to escape fine, imprisonment, and the like: and particularly in the cases of omission, as not repairing a bridge, or a high way, and other similar offences; for, not having the command of his fortune till the age of 21, he wants the capacity to do those things which the law requires. But where there is any notorious breach of the peace, a riot, battery, or the like, (which infants when full-grown are at least as liable as others to commit); for those, an infant above the age of 14 is equally liable to suffer as a person of the full age of 21.

With regard to capital crimes, the law is still more minute and circumspect; distinguishing with greater nicety the several degrees of age and discretion. By

the ancient Saxon law, the age of twelve years was established for the age of possible discretion, when first the understanding might open; and from thence till the offender was 14, it was *ætas pubertati proxima*, in which he might, or might not, be guilty of a crime, according to his natural capacity or incapacity. This was the dubious stage of discretion; but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could he supposed innocent, of any capital crime which he in fact committed. But by the law, as it now stands, and has stood at least ever since the time of Edward III. the capacity of doing ill, or contracting guilt, is not so much measured by years and days, as by the strength of the delinquent's understanding and judgment. For one lad of 11 years' old may have as much cunning as another of 14; and in these cases our maxim is, that *malitia supplet ætatem*.

Under seven years of age, indeed, an infant cannot be guilty of felony; for then a felonious discretion is almost an impossibility in nature: but at eight years old, he may be guilty of felony. Also, under 14, though an infant shall be *prima facie* adjudged to be *doli incapax*, yet if it appear to the court and jury that he was *doli capax*, and could discern between good and evil, he may be convicted and suffer death. Thus a girl of 13 has been burnt for killing her mistress: and one boy of ten, and another of nine years old, who had killed their companions, have been sentenced to death, and he of ten years actually hanged; because it appeared upon their trials, that the one hid himself, and the other hid the body he had killed; which hiding manifested a consciousness of guilt, and a discretion to discern between good and evil. And there was an instance in the last century, where a boy of eight years old was tried at Abington for firing two barns; and, it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus also, in very modern times, a boy of ten years old was convicted on his own confession of murdering his bedfellow; there appearing in his whole behaviour plain tokens of a mischievous disposition; and, as the sparing this boy merely on account of his tender years might be of dangerous consequence to the public, by propagating a notion that children might commit such atrocious crimes with impunity, it was unanimously agreed by all the judges, that he was a proper subject of capital punishment. But, in all such cases, the evidence of that malice, which is to supply age, ought to be strong and clear beyond all doubt and contradiction.

2. In *civil* matters. The ages of male and female are different for different purposes. A male at 12 years old may take the oath of allegiance; at 14 is at the years of discretion, and therefore may consent or disagree to marriage, may choose his guardian, and, if his discretion be actually proved, may make his testament of his personal estate; at 17 may be an executor; and at 21 is at his own disposal, and may alienate his land, goods, and chattles. A female also at seven years of age may be betrothed or given in marriage; at nine is entitled to dower: at 12 is at years of maturity, and therefore may consent or disagree to marriage, and, if proved to have sufficient discretion, may bequeath her personal estate; at 14 is at years of legal discretion, and may choose a guardian; at 17 may be executrix; and at 21

Infant

Et seq
Comment

infant. may dispose of herself and her lands. So that full age in male or female is 21 years. which age is completed on the day preceding the anniversary of a person's birth; who till that time is an infant, and so styled in law. Among the ancient Greeks and Romans, women were never of age, but subject to perpetual guardianship, unless when married, *nisi convenissent in manum viri*: and when that perpetual tutelage wore away in process of time, we find that, in females as well as males, full age was not till 25 years. Thus by the constitution of different kingdoms, this period, which is merely arbitrary, and *juris positivi*, is fixed at different times. Scotland agrees with England in this point; (both probably copying from the old Saxon constitutions on the continent, which extended the age of minority *ad annum vigesimum primum, et eo usque juvenes sub tutelam reponunt*): but in Naples persons are of full age at 18; in France, with regard to marriage, not till 30; and in Holland at 25.

The very disabilities of infants are privileges; in order to secure them from hurting themselves by their own improvident acts. An infant cannot be sued but under the protection, and joining the name, of his guardian; for he is to defend him against all attacks as well by law as otherwise: but he may sue either by his guardian, or *prochein amy*, his next friend who is not his guardian. This *prochein amy* may be any person who will undertake the infant's cause; and it frequently happens, that an infant, by his *prochein amy*, institutes a suit in equity against a fraudulent guardian.

With regard to estates and civil property, an infant hath many privileges. In general, an infant shall lose nothing by nonclaim, or neglect of demanding his right; nor shall any other *laches* or negligence be imputed to an infant, except in some very particular cases.

It is generally true, that an infant can neither aliene his lands, nor do any legal act, nor make a deed, nor indeed any manner of contract, that will bind him. But still to all these rules there are some exceptions: part of which were just now mentioned in reckoning up the different capacities which they assume at different ages: and there are others, a few of which it may not be improper to recite, as a general specimen of the whole. And, first, it is true, that infants cannot aliene their estates; but infant trustees, or mortgagees, are enabled to convey, under the direction of the court of chancery or exchequer, or other courts of equity, the estates they hold in trust or mortgage, to such person as the court shall appoint. Also it is generally true, that an infant can do no legal act: yet an infant, who has an advowson, may present to the benefice when it becomes void. For the law in this case dispenses with one rule, in order to maintain others of far greater consequence: it permits an infant to present a clerk (who, if unfit, may be rejected by the bishop), rather than either suffer the church to be unserved till he come of age, or permit the infant to be debarred of his right by lapse to the bishop. An infant may also purchase lands, but his purchase is incomplete; for, when he comes to age, he may either agree or disagree to it, as he thinks prudent or proper, without alleging any reason; and so may his heirs after him, if he dies without having completed his agreement. It is, far-

ther, generally true, that an infant, under 21, can make no deed but what is afterwards voidable: yet in some cases he may bind himself apprentice by deed indented or indentures, for seven years; and he may by deed or will appoint a guardian to his children, if he has any. Lastly, it is generally true, that an infant can make no other contract that will bind him: yet he may bind himself to pay for his necessary meat, drink, apparel, physic, and such other necessaries; and likewise for his good teaching and instruction, whereby he may profit himself afterwards.

INFANTELE, and INFANTA, all the sons and daughters of the kings of Spain and Portugal, except the eldest: the princes being called *infantes*, and the princesses *infantas*.

INFANTRY, in military affairs, the whole body of foot-soldiers, whether independent companies or regiments.—The word takes its origin from one of the *infantas* of Spain, who, finding that the army commanded by the king her father had been defeated by the Moors, assembled a body of foot soldiers, and with them engaged and totally routed the enemy. In memory of this event, and to distinguish the foot-soldiers, who were not before held in much consideration, they received the name of *infantry*.

Heavy-armed INFANTRY, among the ancients, were such as wore a complete suit of armour, and engaged with broad shields and long spears. They were the flower and strength of the Grecian armies, and had the highest rank of military honour.

Light-armed INFANTRY, among the ancients, were designed for skirmishes, and for fighting at a distance. Their weapons were arrows, darts, or slings.

Light INFANTRY, among the moderns, have only been in use since the year 1656. They have no camp equipage to carry, and their arms and accoutrements are much lighter than those of the infantry. Light infantry are the eyes of a general, and the givers of sleep and safety to an army. Wherever there is found light cavalry, there should be light infantry. They should be accustomed to the pace of four miles an hour, as their usual marching pace, and to be able to march at five miles an hour upon all particular occasions. Most of the powers on the continent have light infantry. It is only of late years that light infantry came to be used in the British army: But now every regiment has a company of light infantry, whose station is on the left of the regiment, the right being occupied by the grenadiers.

INFATUATE, to prepossess any one in favour of some person or thing that does not deserve it, so far as that he cannot easily be disabused.—The word *infatuate* comes from the Latin *fatuus* "fool;" of *fari*, "to speak out," which is borrowed from the Greek *φαρμα*, whence *φαρμακ*, which signifies the same with *vates* in Latin, or *prophet* in English; and the reason is, because their prophets or priests used to be seized with a kind of madness or folly, when they began to make their predictions, or deliver oracles.

The Romans called those persons *infatuati*, who fancied they had seen visions, or imagined the god Faunus, whom they called *Fatuus*, had appeared to them. This word is more generally applied by the moderns to persons who are what the vulgar call *bewitched*, or under some

Infante
||
Infatuate.

Infection
||
Infibulation.

some peculiar destiny which it appears impossible for them to shun.

INFECTION, among physicians. See **CONTAGION**.

INFESTMENT, in *Scots Law*, the solemnity of the delivery of an heritable subject to the purchaser.

INFÆRIÆ, sacrifices offered by the Romans to the *Di Manes*, or the souls of deceased heroes or other illustrious persons, or even any relation or person whose memory was held in veneration. These sacrifices consisted of honey, water, wine, milk, the blood of victims, variety of balsamic unguents, chaplets, and loose flowers. The victims upon these occasions were generally of the smaller cattle, though in ancient times they sacrificed slaves or captives: But what a shocking view does this give us of their sentiments of human nature, as if nothing but murder, cruelty, and human blood, could satisfy or prove acceptable to a human soul! The sacrifices were usually black and barren. The altars on which they were offered were holes dug in the ground.

The honey, water, wine, &c. were used as libations, and were poured on the tombs of children by children, on those of virgins by virgins, and on those of married men by women. The *infæriæ* were offered on the 9th and 30th days after interment amongst the Greeks, and repeated in the month Anthesterion. The whole of this article applies equally to the Greeks and the Romans.

INFIBULATION, in antiquity. It was a custom among the Romans to infibulate their singing boys, in order to preserve their voices: for this operation, which prevented their retracting the prepuce over the glans, and is the very reverse to circumcision, kept them from injuring their voices by premature and preposterous venery; serving as a kind of padlock, if not to their inclinations, at least to their abilities. It appears by some passages in Martial, that a less decent use was made of infibulation among the luxurious Romans: for some ladies of distinction, it seems, took this method of confining their paramours to their own embraces. Juvenal also hints at some such practice. Celsus, a chaste author, says infibulation was sometimes practised for the sake of health, and that nothing destroys it more than the silly practice this operation seems intended to prevent. This practice is not perhaps likely to be revived; if, however, any one who has suffered in his constitution by preposterous venery, should be able to get children, and should be inclined to prevent the same misfortune in them by infibulation, the method of doing it is thus: The skin which is above the glans is to be extended, and marked on both sides with ink, where it is perforated, and then suffered to retract itself. If the marks recur upon the glans, too much of the skin has been taken up, and we must make the marks farther; if the glans remain free from them, they show the proper place for affixing a fibula: then pass a needle and thread through the skin where the marks are, and tie the threads together; taking care to move it every day, until the parts about the perforations are cicatrised; this being effected, take out the thread, and put in the fibula; which the lighter it is the better.

Authors have not determined what the fibula of the ancient surgeons was, though no doubt it was for diffe-

rent purposes. In the present case, the fibula seems to mean a ring of metal, not unlike what the country people put through the noses of swine.

INFIDEL, a term applied to such persons as are not baptized, and that do not believe the truths of the Christian religion. See **DEIST**.

INFIDELITY, in a general sense, denotes want of faith or belief in regard to any subject or transaction.

Religious INFIDELITY signifies a disbelief of Christianity.

Of all the methods (says an elegant modern essayist*) which the vanity of man has devised with a view to acquire distinction, there is none easier than that of professing a disbelief of the established religion. That which shocks the feelings of those with whom we converse, cannot fail of attracting notice; and as the vain are usually confident, they utter their doubts with an air so oracular and decisive, as induces the simple to think them profoundly wise. Audacity, with little ingenuity, will attract the eyes of spectators, and this will sufficiently answer the purpose of many among the professed unbelievers. One might be diverted, if one were not hurt, at seeing a circle of silly admirers, gaping and fixing their eyes on some half-learned and impudent prater, who throws out oblique insinuations against the Bible, the clergy, or the sacrament. These are fertile topics of wit and ingenuity; but it might mortify the vanity of some very vain writers and talkers, if they were to recollect, what is undoubtedly true, that it is a species of wit and ingenuity which not only the vilest, but the most stupid and illiterate of mankind, have frequently displayed in all its possible perfection.

There is indeed no doubt, but that vanity is one of the principal causes of infidelity. It must be the sole cause of communicating it to others, by writing or conversation. For let us suppose the case of a very humane, judicious, and learned man, entertaining doubts of the truth of Christianity: if he cannot clear his doubts by examination, he will yet recollect that doubts are no certainties; and, before he endeavours to propagate his scepticism, he will ask himself these questions: "Am I quite convinced that what I doubt of cannot possibly be true? If I am convinced of it, am I sure that the publication of my opinions will not do more harm than good? Is not the disturbing of any long established civil constitution attended with confusion, rebellion, bloodshed, and ruin? And are not the majority of men more strongly attached to the religion than the government of their forefathers? Will it serve my country to introduce discontent of any species? May not those innovations in religion, which discontent many introduce, lead to all the evils which are caused by frenzy and fanaticism? Granting that I were able to make a party formidable enough to crush opposition and to exterminate Christianity, still am I certain that I act, in this instance, like a good member of society? For is not this system, whether well or ill founded, friendly to society? I must confess it; its greatest enemies have acknowledged it. What motive then can induce me to divulge my doubts of its authenticity? Not the good of mankind; for it is already allowed by unbelievers, that the good of mankind is interested in the belief of its divine original. Is it for

Infid.

* *Knol.*
Essays,
N^o 10.

my own good, and with a view to be convinced? I will not deceive myself: my motive, I suspect, is of another kind; for do I read those books which have been already written to satisfy similar doubts? Nothing but the vanity of appearing to be wiser than my credulous neighbours can induce me to interrupt the happiness of their belief. But vanity of this sort, which tends to disturb society, to injure the national morals, and to rob many thousand individuals of a copious source of sweet and solid comfort, must be pronounced extreme wickedness, even according to the obvious dictates of natural religion. I shall act the part of a good citizen and a good man, by conforming to a system whose beneficial influence I feel and confess, and by endeavouring to acquire a belief in that which has for so many centuries been established, and which promises to soothe me in distress with the sweetest consolations, and to brighten the dismal hour of death, by the hope of a more glorious and happy state of existence. At all events, I shall have the satisfaction of having commanded myself so far, as not to have run the hazard of endangering the welfare of my fellow-creatures, either here or hereafter, by indulging a degree of vanity, which, in a creature so weak and so short-lived as myself, is a folly very inconsistent with the superior wisdom which I seem to arrogate.

“I will venture to repeat (continues our author), that all writers against Christianity, however they may affect even the extremes of benevolence, honour, philosophy, and enlargement of mind, are actuated by vanity and wickedness of heart. Their motives are as mean, selfish, narrow, and in every respect unjustifiable, as the tendency of their writings is mischievous. Their malice is often impotent, through the foolish sophistry of their arguments; but, if ever it be successful, it is highly injurious: and indeed, considering their motives and the probable consequences of their endeavours, the infidel writer is a greater enemy to society, and consequently guiltier, according to all the principles of social union, than the thief or the traitor. Persecution would, however, only promote his cause, and his proper punishment is contempt.

“It is certainly no derogation from the character of a man of sense, to conform, even while he is so unfortunate as to doubt their truth, to the opinions of his country. His conformity will probably lead him to a train of actions and of thought, which, in due time, will induce him to believe. But, if that should not happen, yet he will act, as very wise and very great men have acted, in paying a respectful deference to the avowed conviction of others. The most intelligent and powerful men of ancient Rome, not only appeared to believe a very absurd and hurtful system, but assisted in all its ceremonies as priests. Even Socrates, who evidently entertained some notions adequate to the dignity of the one great and supreme Being, yet thought it was a duty which he owed to his country, so far to conform to the wretched establishment, as to order in his dying words a sacrifice to Æsculapius. This external conformity to the national religion ought not to be confounded with hypocrisy. If indeed it is carried to extremes, or zealously affected, it certainly is very blameable and contemptible deceit; but while it keeps within the bounds of reason and moderation, it ought

to be called a decent deference to the opinions of the majority, arising from humility, and from a desire to maintain the tranquillity of the state, and to continue an innocent and useful system, which has and will always greatly contribute to lessen the quantity and degree both of moral and of natural evil.

“The easiest, after all, or at least the most effectual method of appearing in any character, is really to be what we wish to appear. But belief, you will say, is not in our power, and how can we believe what appears to us incredible? Certainly you cannot while it appears incredible. But let me ask you, whether you have taken any pains to believe, or have at once and at a glance persuaded yourself, that the Christian religion is totally false? It is probable that a great number of sceptical writers never gave themselves the trouble to read those Scriptures which they warmly oppose. They hear objections, they read objections, and they find, that from men of reputed wit and ingenuity the objections often originate. They also wish to be reputed men of wit and ingenuity, and therefore eagerly adopt the language and sentiments of the order. Perhaps the vanity and pride of this class of men will render all attempts to convince them abortive; but to modest doubters, and to those whose good sense and good dispositions lead them to wish to adopt the religion of their country, it may not be useless to suggest advice, with a view to facilitate their conviction.

“The chief thing required is to free themselves from the pride of human reason. Humility (and surely our blindness and imperfections are sufficient to render us humble, if we would be reasonable), humility will open our hearts, and belief will find admission. Sincere endeavours, seconded by prayers, will never fail to help our unbelief. But, alas! a fine, gay, spirited, liberal, and enlarged modern philosopher, would be ashamed to be found on his knees, or with a Testament in his possession. There is scarcely any vicious act, or any vicious book, which would put him so much to the blush.

“A modest well-meaning man might, however, one should think, divest himself of those prejudices which prevent the possibility of belief, by the following soliloquy: ‘I find myself placed in a world abounding with evil and misery. Under the immediate pressure of it, I feel my heart inclining, like the needle to the north, by its natural tendency, to the Deity for support. Man, of all animals, is the only one who has a sense of religion. Feeling this distinctive property of my nature, I look around to discover to what object, and in what manner, that part of my fellow-creatures, who live in the same society with myself, pay their adoration. I find a system of religion already established, and which has been established in the most enlightened countries of the earth near 2000 years. I resolve to examine it. It claims that respect from its antiquity and universality. Many difficulties appear on the first inspection. My reason is often startled, and my belief wavers. But I will not yet give up a point of so serious importance, without further and closer attention to it. I reflect, that 2000 years is a vast space in the age of the world. How many myriads of men like myself have lived and died in the said duration of that time! And were all of them fools or hypocrites?’

Infinite
||
Infinitesi-
ma's.

crites? It could not have been. Can the understanding of a poor individual, just come into the world, and hardly knowing where he is, comprehend on intuition an object of such magnitude, and make the mighty discovery which has eluded millions of the wisest and most learned of mortals? Or, supposing that they all perceived the deception, am I then at last the only honest man who will confess it? I am ashamed to avow such an idea to myself. But yet, if I reject what they received, surely I avow it in the more expressive language of my conduct. Pride, I fear, is the foundation of my scepticism; and humility must form the basis of my belief. I will check my own presumption, and reject the cavils of vain and foolish philosophy. Shall a poor weak creature, who cometh up like a flower, and is cut down, who fleeth as a shadow, and never continueth in one stay, presume to pronounce decisively in that little period, in which he has scarcely time to look about him before he dies, against a system which has strong internal and external evidence of divine original, which is most useful and comfortable, and which has been admitted among a great portion of mankind during almost 20 centuries? No, it is the first wisdom to be humble. Humility will be followed by grace, and grace by faith, and faith by salvation. It plainly appears, that I can lose nothing by belief, but some of those excessive and irregular enjoyments, which would destroy my health and life; but I may possibly gain a glory and a happiness which shall continue to all eternity."

INFINITE, that which has neither beginning nor end: in which sense God alone is infinite.

INFINITE is also used to signify that which has had a beginning, but will have no end, as angels and human souls. This makes what the schoolmen call *infinitum à parte post*; as, on the contrary, by *infinitum à parte ante*, they mean that which has an end, but had no beginning.

INFINITE Quantities. The very idea of magnitudes infinitely great, or such as exceed any assignable quantities, does include a negation of limits; yet if we nearly examine this notion, we shall find that such magnitudes are not equal among themselves, but that there are really, besides infinite length and infinite area, three several sorts of infinite solidity, all of which are *quantitates sui generis*, and that those of each species are in given proportions.

Infinite length, or a line infinitely long, is to be considered either as beginning at a point, and so infinitely extended one way, or else both ways from the same point; in which case the one, which is a beginning infinity, is the one half of the whole, which is the sum of the beginning and ceasing infinity; or, as may be said, of infinity *à parte ante* and *à parte post*, which is analogous to eternity in time and duration, in which there is always as much to follow as is past, from any point or moment of time; nor doth the addition or subtraction of finite length, or space of time, alter the case either in infinity or eternity, since both the one or the other cannot be any part of the whole.

INFINITESIMALS, among mathematicians, are defined to be infinitely small quantities.

In the method of infinitesimals, the element, by which any quantity increases or decreases, is supposed to be infinitely small; and is generally expressed by two or

more terms, some of which are infinitely less than the rest; which being neglected as of no importance, the remaining terms form what is called the *difference of the proposed quantity*. The terms that are neglected in this manner, as infinitely less than the other terms of the element, are the very same which arise in consequence of the acceleration or retardation of the generating motion, during the infinitely small time in which the element is generated: so that the remaining terms express the elements that would have been produced in that time, if the generating motion had continued uniform: therefore those differences are accurately in the same ratio to each other as the generating motions or fluxions. And hence, though in this method infinitesimal parts of the elements are neglected, the conclusions are accurately true without even an infinitely small error, and agree precisely with those that are deduced by the method by fluxions. See FLUXIONS.

INFINITIVE, in *Grammar*, the name of one of the moods, which serve for the conjugating of verbs. See GRAMMAR.

INFINITY, the quality which denominates a thing infinite. See METAPHYSICS.

INFIRMARY, a kind of hospital, where the weak and sick are properly taken care of.

INFLAMMABILITY, that property of bodies which disposes them to kindle or catch fire. See CHEMISTRY, N^o 336. p. 490.

INFLAMMATION, in *Medicine and Surgery*, a redness and swelling of any part of the body, attended with heat, pain, &c. See MEDICINE *Index*.

INFLAMMATION of Oils by concentrated Acids. See CHEMISTRY, N^o 876 and 893.

INFLATION, formed from *in* and *flatus*; of *flo*, "I blow;" blowing up, the act of stretching or filling any flaccid or distensible body with a flatulent or windy substance.

INFLECTED RAYS. See *Inflected Rays*.

INFLECTION, called also a *diffraction*, and *deflection*, in *Optics*, is a property of light, by reason of which, when it comes within a certain distance of any body, it will either be bent from it, or towards it; which is a kind of imperfect reflection or refraction. See OPTICS.

INFLECTION, or *Point of INFLECTION*, in the higher geometry, is a point where a curve begins to bend a contrary way.

INFLECTION, in *Grammar*, the variation of nouns and verbs, by declension and conjugation.

INFLUENCE, a quality supposed to flow from the heavenly bodies, either with their light or heat; to which astrologers idly ascribe all sublunary events.

Alchemists also, who to this ascribe the philosophers stone, tell us, that every thing in nature is produced by the influence of the stars, which, in their passage through the atmosphere, imbibe many of its moist parts, the grossest whereof they deposit in the sands and earths where they fall; that these, filtrating through the pores of the earth, descend even to the centre, whence they are driven, by the central fire, back again to the surface; and in their ascent, by a natural kind of sublimation, as they find earths duly disposed, they form natural bodies, as metals, minerals, and vegetables, &c. Thus, it is pretended, that chemistry, consisting

Infinite
||
Influenc

Informa-
tion,
Informet.

consisting of an artificial imitation of these natural operations, and in applying active principles to passive principles, can form natural bodies, make gold, &c.

INFORMATION, in *Law*, is nearly the same in the crown-office, as what in other courts is called a *declaration*. See **PROSECUTION**.

Informations are of two sorts; first, those which are partly at the suit of the king, and partly at that of a subject; and secondly, such as are only in the name of the king. The former are usually brought upon penal statutes, which inflict a penalty upon conviction of the offender, one part to the use of the king, and another to the use of the informer. By the statute 31 Eliz. c. 5, no prosecution upon any penal statute, the suit and benefit whereof are limited in part to the king and in part to the prosecutor, can be brought by any common informer after one year is expired since the commission of the offence; nor on behalf of the crown, after the lapse of two years longer; nor, where the forfeiture is originally given only to the king, can such prosecution be had after the expiration of two years from the commission of the offence.

The informations that are exhibited in the name of the king alone, are also of two kinds: first, those which are truly and properly his own suits, and filed *ex officio* by his own immediate officer, the attorney-general: secondly, those in which, though the king is the nominal prosecutor, yet it is at the relation of some private person or common informer; and they are filed by the king's coroner and attorney in the court of king's bench, usually called the *master of the crown-office*, who is for this purpose the standing officer of the public. The objects of the king's own prosecutions, filed *ex officio* by his own attorney-general, are properly such enormous misdemeanors, as peculiarly tend to disturb or endanger his government, or to molest or affront him in the regular discharge of his royal functions. For offences so high and dangerous, in the punishing or preventing of which a moment's delay would be fatal, the law has given to the crown the power of an immediate prosecution, without waiting for any previous application to any other tribunal: which power, thus necessary, not only to the ease and safety, but even to the very existence, of the executive magistrate, was originally reserved in the great plan of the English constitution, wherein provision is wisely made for the due preservation of all its parts. The objects of the other species of informations, filed by the master of the crown-office upon the complaint or relation of a private subject, are any gross and notorious misdemeanors, riots, batteries, libels, and other immoralities of an atrocious kind, not peculiarly tending to disturb the government (for those are left to the care of the attorney-general), but which, on account of their magnitude or pernicious example, deserve the most public animadversion. And when an information is filed, either thus, or by the attorney-general *ex officio*, it must be tried by a petit jury of the county where the offence arises: after which, if the defendant be found guilty, he must resort to the court for his punishment. See a history and vindication of this mode of prosecution in the work cited on the margin, vol. iv. p. 309—312.

INFORMER (*informator*) in *Law*, a person that informs against, or prosecutes in any of the king's

courts, those that offend against any law or penal statute. See **INFORMATION**.

Informers were very common both in Greece and Rome. Every corner of the streets was pestered with swarms of turbulent rascals, who made it their constant business to pick up stories and catch at every occasion to accuse persons of credit and reputation: These by the Greeks were called *Συκοφανται*; for a more particular account of whom, see the article **SYCOPHANT**.

Amongst the Romans, informers were of two sorts, *mandatores* and *delatores*. These played into each other's hands; the former marking down such persons as they pretended to have found guilty of any misdemeanor, and the other prosecuting them. What tended to increase the number of these pestilent fellows was, that the informers were entitled to a fourth part of the effects of the person convicted. Wicked princes rewarded and countenanced this mischievous tribe; but Titus set on foot a most diligent search after them, and punished such as he found with death or banishment. Trajan also is praised by Pliny for a similar conduct.

INFRACTION (formed from *in*, and the supine of *frango*, "I break,") a rupture or violation of a treaty, law, ordinance, or the like.

INFRALAPSARII, the name of a sect of predestinarians, who maintain, that God has created a certain number of men only to be damned, without allowing them the means necessary to save themselves, if they would; and they are thus called, because they hold that God's decrees were formed *infra lapsum*, after his knowledge of the fall, and in consequence thereof; in contradistinction to the **SUPRALAPSARIANS**.

INFRA SCAPULARIS, in *Anatomy*. See **ANATOMY**, *Table of the Muscles*.

INFRA SPINATUS, in *Anatomy*. See **ANATOMY** *ibid.*

INFULA, in antiquity, was a mitre worn by the Roman and Grecian priests upon the head, from which on each side hung a ribband. The covering the head with a mitre was rather a Roman than a Grecian custom, introduced into Italy by Æneas, who covered his head and face at the performance of sacrifice, lest any ill-boding omen should disturb the rites. The infule were commonly made of wool, and were not only worn by the priests, but were put upon the horns of the victims, upon the altar and the temple. The infule were also called *vitta*.

INFUNDIBULIFORM, in *Botany*, an appellation given to such monopetalous or one-leaved flowers as resemble a funnel in shape, or which have a narrow tube at one end, and gradually widen towards the limb or mouth.

INFUSION, in *Pharmacy*, an operation, whereby the virtues of plants are drawn out, by steeping them in some convenient fluid without boiling.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, remarkable for having been the residence of the emperor; seated on the river Salva, on an eminence, from whence there is a charming prospect. E. Long. 8 5. N. Lat. 49. 58.

INGENUOUS, in a general sense, signifies *open, fair, and candid*.

INGENUOUS (*ingenuus*), in Roman antiquity, an appellation given to persons born of free parents, who had never been slaves: for the children of the *liberti*,

Infraction
||
Ingenuous.

Blackf.
Comments.

Ingesta
||
Ingrati-
tude.

or persons who had obtained their liberty, were called *libertini*, not *ingenui*; this appellation of *ingenuus* being reserved for their children, or the third generation.

INGESTA, is used by some authors to express all sorts of aliment taken into the body.

INGLUVIES, the crop or craw of granivorous birds, serving for the immediate reception of the food, where it is macerated for some time before it is transmitted to the true stomach.

INGOLSTADT, a handsome town of Germany, and the strongest in Bavaria, with a famous university and a handsome church. The houses are built with stone, and the streets large. It is seated on the Danube, in E. Long. 11. 10. N. Lat. 48. 42.

INGOT, a mass of gold or silver melted down, and cast in a mould, but not coined or wrought.

INGRAFTING, in *Gardening*. See GRAFTING, GARDENING *Index*.

INGRATITUDE, the opposite of gratitude. See GRATITUDE.

Ingratitude is a crime so shameful, that there never was a man found who would own himself guilty of it, and, though too frequently practised, it is so abhorred by the general voice, that to an ungrateful person is imputed the guilt or the capability of all other crimes.

The ungrateful are neither fit to serve their Maker, their country, nor their friends.

Ingratitude perverts all the measures of religion and society, by making it dangerous to be charitable and good natured. (See GRATITUDE). However, it is better to expose ourselves to ingratitude than to be wanting in charity and benevolence.

Great minds, like Heav'n, are pleas'd with doing good;
Though the ungrateful subjects of their favours
Are barren in return.

1. In a little work intitled *Friendly Cautions to Officers*, the following atrocious instance of ingratitude is related. An opulent city in the west of England, little used to have troops with them, had a regiment sent to be quartered there: the principal inhabitants and wealthiest merchants, glad to show their hospitality and attachment to their sovereign, took the first opportunity to get acquainted with the officers, inviting them to their houses, and showing them every civility in their power. This was truly a desirable situation. A merchant, extremely easy in his circumstances, took so prodigious a liking to one officer in particular, that he gave him an apartment in his own house, and made him in a manner absolute master of it, the officer's friends being always welcome to his table. The merchant was a widower, and had only two favourite daughters; the officer in so comfortable a station cast his wanton eyes upon them; and too fatally succeeding, ruined them both. Dreadful return to the merchant's misplaced friendship! The consequence of this ungenerous action was, that all officers ever after were shunned as a public nuisance, as a pest to society: nor have the inhabitants perhaps yet conquered their aversion to a red-coat.

2. We read in Rapin's History, that during Monmouth's rebellion, in the reign of James II. a certain person knowing the humane disposition of one Mrs

Gaunt, whose life was one continued exercise of beneficence, fled to her house, where he was concealed and maintained for some time. Hearing, however, of the proclamation, which promised an indemnity and reward to those who discovered such as harboured the rebel, he betrayed his benefactress; and such was the spirit of justice and equity which prevailed among the ministers, that he was pardoned and recompensed for his treachery, while she was burnt alive for her charity!

3. The following instance is also to be found in the same history.—Humphry Bannister and his father were both servants to and raised by the duke of Buckingham; who being driven to abscond, by an unfortunate accident befalling the army he had raised against the usurper Richard III. he without footman or page retired to Bannister's house near Shrewsbury, as to a place where he had all the reason in the world to expect security. Bannister, however, upon the king's proclamation promising 1000*l.* reward to him that should apprehend the duke, betrayed his master to John Merton high sheriff of Shropshire, who sent him under a strong guard to Salisbury, where the king then was, and there in the market-place the duke was beheaded. But Divine vengeance pursued the traitor Bannister; for demanding the 1000*l.* that was the price of his master's blood, King Richard refused to pay it him, saying, "He that would be false to so good a master, ought not to be encouraged." He was afterwards hanged for manslaughter, his eldest son run mad and died in a hog-sty, his second became deformed and lame, and his third son was drowned in a small puddle of water. His eldest daughter was got with child by one of his carter's, and his second was seized with a leprosy whereof she died.—*Hist. of Eng.* 8vo. vol. i. p. 304.

The following barbarous instances are from ancient History.

4. When Xerxes king of Persia was at Celene, a *Vid. Hero* city of Phrygia, Pythius, a Lydian, who had his re- l. vii. c. 3; Seneca, de Ira, l. iii. c. 17. sidence in that city, and next to Xerxes was the most opulent prince of those times, entertained him and his whole army with an incredible magnificence, and made him an offer of all his wealth towards defraying the expences of his expedition. Xerxes, surprised and charmed at so generous an offer, had the curiosity to inquire to what a sum his riches amounted. Pythius made answer, that having the design of offering them to his service, he had taken an exact account of them, and that the silver he had by him amounted to 2000 talents (about 255,000*l.* sterling), and the gold to 4,000,000 of darics (about 1,700,000*l.* sterling), wanting 7000. All this money he offered him, telling him, that his revenue was sufficient for the support of this household. Xerxes made him very hearty acknowledgments, and entered into a particular friendship with him, but declined accepting his present. The same prince who had made such obliging offers to Xerxes, having desired a favour of him some time after, that out of his five sons who served in his army, he would be pleased to leave him the eldest, in order to be a comfort to him in his old age: the king was so enraged at the proposal, though so reasonable in itself, that he caused the eldest son to be killed before the eyes of his father, giving the latter to understand, that

Ingrati-
tude.

that it was a favour he spared him and the rest of his children. Yet this is the same Xerxes who is so much admired for his humane resolution at the head of his numerous army, "That of so many thousand men, in 100 years time there would not be one remaining; on which account he could not forbear weeping at the uncertainty and instability of human things." He might have found another subject of reflection, which would have more justly merited his tears and affliction, had he turned his thoughts upon himself, and considered the reproaches he deserved for being the instrument of hastening the fatal term to millions of people, whom his cruel ambition was going to sacrifice in an unjust and unnecessary war.

5. Basilus Macedo the emperor, exercising himself in hunting, a sport he took great delight in, a great stag running furiously against him, fastened one of the branches of his horns in the emperor's girdle, and pulling him from his horse, dragged him a good distance, to the imminent danger of his life; which a gentleman of his retinue perceiving, drew his sword and cut the emperor's girdle asunder, which disengaged him from the beast, with little or no hurt to his person. But observe what reward he had for his pains: "He was sentenced to lose his head for putting his sword so near the body of the emperor;" and suffered death accordingly.

INGRESS, in *Astronomy*, signifies the sun's entering the first scruple of one of the four cardinal signs, especially Aries.

INGRIA, a province of the Russian empire, lying on the gulf of Finland, being about 130 miles in length, and 50 in breadth. It abounds in game and fish; and here are a great number of elks, which come in troops from Finland in the spring and autumn. It was conquered by the Czar Peter the Great, and Petersburg is the capital town. It is bounded by the river Neva, and the gulf of Finland, on the north; by Great Novogorod, on the east and south; and by Livonia, on the west.

INCROSSER, or ENGROSSER, in common law, is one who buys up corn growing, or any provisions by wholesale, before the market, to sell again. See FORESTALLING.

It also signifies a clerk who writes records or instruments of law on skins of parchment. See ENGROSSING.

INGUEN, in *Anatomy*, the same with what is otherwise called *groin*.

INGULPHUS, abbot of Croyland, and author of the history of that abbey, was born in London about A. D. 1030. He received the first part of his education at Westminster; and when he visited his father, who belonged to the court of Edward the Confessor, he was so fortunate as to engage the attention of Queen Edgitha. That amiable and learned princess took a pleasure in examining our young scholar on his progress in grammar, and in disputing with him in logic; nor did she ever dismiss him without some present as a mark of her approbation. From Westminster he went to Oxford, where he applied to the study of rhetoric, and of the Aristotelian philosophy, in which he made greater proficiency than many of his contemporaries. When he was about 21 years of age, he was introduced to William duke of Normandy (who visited the

court of England, A. D. 1051, and made himself so agreeable to that prince, that he appointed him his secretary, and carried him with him into his own dominions. In a little time he became the prime favourite of his prince, and the dispenser of all preferments, humbling some, and exalting others, at his pleasure; in which difficult station, he confesseth, he did not behave with a proper degree of modesty and prudence. This excited the envy and hatred of many of the courtiers; to avoid the effects of which, he obtained leave from the duke to go in pilgrimage to the Holy Land. With a company of 30 horsemen, he joined Sigfrid duke of Mentz, who, with many German nobles, bishops, clergy, and others, was preparing for a pilgrimage to Jerusalem. When they were all united, they formed a company of no fewer than 7000 pilgrims. In their way they spent some time at Constantinople, performing their devotions in the several churches. In their passage through Lycia, they were attacked by a tribe of Arabs, who killed and wounded many of them, and plundered them of a prodigious mass of money. Those who escaped from this disaster, at length reached Jerusalem, visited all the holy places, and bedewed the ruins of many churches with their tears, giving money for their reparation. They intended to have bathed in Jordan; but being prevented by the roving Arabs, they embarked on board a Genoese fleet at Joppa, and landed at Brundisium, from whence they travelled through Apulia to Rome. Having gone through a long course of devotions in this city, at the several places distinguished for sanctity, they separated, and every one made the best of his way into his own country. When Ingulph and his company reached Normandy, they were reduced to 20 half-starved wretches, without money, clothes, or horses: A faithful picture of the disastrous journeys into the Holy Land, so common in those times. Ingulph was now so much disgusted with the world, that he resolved to forsake it, and became a monk in the abbey of Fontevelle in Normandy; in which, after some years, he was advanced to the office of prior. When his old master was preparing for his expedition into England, A. D. 1066, he was sent by his abbot, with 100 marks in money, and 12 young men, nobly mounted and completely armed, as a present from their abbey. Ingulph having found a favourable opportunity, presented his men and money to his prince, who received him very graciously; so he part of the former affection for him reviving in his bosom. In consequence of this he raised him to the government of the rich abbey of Croyland in Lincolnshire, A. D. 1076, in which he spent the last 34 years of his life, governing that society with great prudence, and protecting their possessions from the rapacity of the neighbouring barons by the favour of his royal master. The lovers of English history and antiquities are much indebted to this learned abbot, for his excellent history of the abbey of Croyland, from its foundation, A. D. 664, to A. D. 1091, into which he hath introduced much of the general history of the kingdom, with a variety of curious anecdotes that are now re-else to be found. Ingulph died of the gut, at his abbey, A. D. 1109, in the 79th year of his age.

INHALER, in *Medicine*, a machine for breathing in warm steams into the lungs, recommended by Mr

Inheritance Mulge in the cure of the catarrhous cough. The
Injection body of the instrument holds about a pint; and the
 handle, which is fixed to the side of it, is hollow. In
 the lower part of the vessel, where it is soldered to the
 handle, is a hole, by means of which, and three others on
 the upper part of the handle, the water, when it is
 poured into the inhaler, will rise to the same level in
 both. To the middle of the cover a flexible tube
 about five or six inches long is fixed, with a mouth-piece
 of wood or ivory. Underneath the cover there is a
 valve fixed, which opens and shuts the communication
 between the upper and internal part of the inhaler
 and the external air. When the mouth is applied to
 the end of the tube in the act of inspiration, the air
 rushes into the handle, and up through the body of
 warm water, and the lungs become, consequently,
 filled with hot vapours. In expiration, the mouth
 being still fixed to the tube, the breath, together
 with the steam on the surface of the water in the
 inhaler, is forced up through the valve in the cover.
 In this manner, therefore, the whole act of
 respiration is performed through the inhaler, with-
 out the necessity, in the act of expiration, of either
 breathing through the nose, or removing the pipe from
 the mouth.

INHERITANCE, a perpetual right or interest
 in lands, invested in a person and his heirs. See
DESCENT.

INHIBITION, a writ to inhibit or forbid a judge
 from farther proceeding in a cause depending before
 him.

Sometimes prohibition and inhibition are put to-
 gether, as of the same import; but inhibition is most
 commonly a writ issuing out of a higher court-christian
 to a lower; and prohibition out of the king's court to
 an inferior court.

INHIBITION, in *Scots Law*, a diligence obtained at
 the suit of a creditor against his debtor, prohibiting
 him from selling or contracting debts upon his estate to
 the creditor's prejudice.

INJECTION, the forcibly throwing certain liquid
 medicines into the body by means of a syringe, tube,
 clyster-pipe, or the like.

INJECTION, in *Surgery*, the throwing in some liquor
 or medicine into a vein opened by incision. This
 practice, and that of transfusion, or the conveying the
 arterial blood of one man, or other animal, into ano-
 ther, were once greatly practised, but are now laid
 aside.

Anatomical INJECTION, the filling the vessels of a hu-
 man, or other animal body, with some coloured sub-
 stance, in order to make their figures and ramifica-
 tions visible.

I. The best account of the method of injecting the
fanguisferous vessels of animals, is that by the late
 Dr. Monro, published in the *Medical Essays*, vol. i.
 p. 79.

“The instrument with which the liquor is commonly
 thrown into the vessels is a tight easy going syringe of
 brass, to which several short pipes are fitted, and can
 be fixed by screws, the other extremities of these pipes
 being of different diameters without any screw, that
 they may slide into other pipes, which are so exactly
 adapted to them at one end, that when they are pressed
 a little together, nothing can pass between them: and

because their cohesion is not so great as to resist the
 pushing force of the injection, which would drive off
 this second pipe, and spoil the whole operation; there-
 fore the extremity of this second sort of pipes, which
 receives the first kind, is formed on the outside into a
 square, bounded behind and before by a rising circle,
 which hinders the key that closely grasps the square
 part from sliding backwards or forwards; or a bar of
 brass must stand out from each side of it to be held with
 the fingers. The other extremity of each of these se-
 cond sort of pipes is of different diameter; and near it
 a circular notch, capable of allowing a thread to be
 sunk into it, is formed; by this, the thread tying the
 vessel at which the injection is to be made, will not be
 allowed to slide off.

“Besides this form described, common to all this
 second sort of pipes, we ought to have some of the
 larger ones, with an additional mechanism, for particu-
 lar purposes; as, for instance, when the larger vessels
 are injected, the pipe fastened into the vessel ought ei-
 ther to have a valve or a stop-cock, that may be turn-
 ed at pleasure, to hinder any thing to get out from
 the vessel by the pipe; otherwise, as the injection, in
 such a case, takes time to coagulate, the people em-
 ployed in making the injection must either continue
 all that while in the same posture; or, if the syringe
 is too soon taken off, the injected liquor runs out and
 the larger vessels are emptied. When the syringe is
 not large enough to hold at once all the liquor neces-
 sary to fill the vessels, there is a necessity of filling it
 again. If, in order to do this, the syringe was to be ta-
 ken off from the pipe fixed in the vessel, some of the
 injection would be lost, and what was exposed to the
 air would cool and harden; therefore some of the pipes
 ought to have a reflected curve tube coming out of
 their side, with a valve so disposed, that no liquor
 can come from the straight pipe into the crooked one,
 but, on the contrary, may be allowed to pass from the
 crooked to the straight one: the injector then, taking
 care to keep the extremity of the reflected pipe im-
 mersed in the liquor to be injected, may, as soon as he
 has pushed out the first syringeful, fill it again by
 only drawing back the sucker; and, repeating this
 quickly, will be able to throw several syringefuls into
 the vessels.

“All these different sorts of pipes are commonly
 made of brass.

“The liquors thrown into the vessels, with a design
 to fill the small capillary tubes, are either such as
 will incorporate with water, or such as are oily:
 both kinds have their advantages and inconveniences;
 which I shall mention in treating of each, and shall
 conclude with that which I have found by experience
 to succeed best.

“All the different kinds of glue, or ichthyocola,
 syths, common glue, &c. dissolved and pretty much
 diluted, mix easily with the animal fluids, which is of
 great advantage, and will pass into very small vessels
 of a well-chosen and prepared subject, and often an-
 swer the intention sufficiently, where the design is on-
 ly to prepare some very fine membrane, on which no
 vessels can be expected to be seen so large as the eye
 can discover whether the transverse sections of the ves-
 sels would be circular, or if their sides are collapsed.
 But when the larger vessels are also to be prepared,
 there

jection. there is a manifest disadvantage to the usefulness and beauty of the preparation; for if nothing but the glutinous liquor is injected, one cannot keep a subject so long as the glue takes of becoming firm; and therefore, in dissecting the injected part, several vessels will probably be cut and emptied. To prevent this, one may indeed either soak the part well in alcohol, which coagulates the glue; but then it becomes so brittle, that the least handling makes it crack; and if the preparation is to be kept, the larger vessels appear quite shrivelled, when the watery part of the injection is evaporated: or the efflux of the injection may be prevented, by carefully tying every vessel before we are obliged to cut it; still, however, that does not hinder the vessels to contract when the glue is drying. If, to obviate these difficulties, the glutinous liquor should first be injected in such quantity as the capillary vessels will contain, and the common oily or waxy injection is pushed in afterwards to keep the larger vessels distended, the wax is very apt to harden before it has run far enough; the two sorts of liquors never miss to mix irregularly, and the whole appears interrupted and broken by their soon separating from each other; which is still more remarkable afterwards, when the watery particles are evaporated.

"Spirits of wine coloured mixes with water and oils, and so far is proper to fill the very smaller vessels with: but, on the other hand, it coagulates any of our liquor it meets, which sometimes blocks up the vessels so much, that no more injection will pass; then it scarce will suspend some of the powders that prove the most durable colours; and as it entirely evaporates, the vessels must become very small; and the small quantity of powder left, having nothing to serve for connecting its particles together, generally is seen so interrupted, that the small ramifications of vessels rather have the appearances of random scratches of a pencil, than of regular continued canals.

"Melted tallow, with a little mixture of oil of turpentine, may sometimes be made to fill very small vessels, and keeps the larger ones at a full stretch; but where any quantity of the animal liquors are still in the vessels, it is liable to stop too soon, and never can be introduced into numbers of vessels, which other liquors enter; and it is so brittle, that very little handling makes it crack, and thereby renders the preparation very ugly (A).

* The method I have always succeeded best with, in making what may be called *subtile* or *fine injections*, is, first throw in coloured oil of turpentine, in such a quantity as might fill the very small vessels; and, immediately after, to push the common coarse injection into the larger ones. The oil is subtile enough to enter rather smaller capillary tubes than any colouring can;

its resinous parts, which remain after the spirituous are evaporated, give a sufficient adhesion to the particles of the substance with which it is coloured, to keep them from separating, and it intimately incorporates with the coarser injection; by which, if the injection is rightly managed, it is impossible or the sharpest eye to discover that two sorts have been made use of (B).

"All the liquors with which the vessels of animals are artificially filled, having very faint, and near the same colours, would not all appear in the very small vessels, because of their becoming entirely diaphanous, without a mixture of some substance to impart its colour to them; and where several sorts of even the largest vessels of any part were filled, one sort could not be distinguished from another, unless the colour of each was different; which has likewise a good effect in making preparations more beautiful. Wherefore anatomists have made use of a variety of such substances, according to their different fancies or intentions; such as gamboge, saffron, ink, bunt ivory, &c. which can be easily procured from painters. My design being only to consider those that are fit to be mixed with the injecting liquors proposed to fill capillary vessels, which is scarce ever to be done in any other, except the branches of the arteries and of some veins, I shall confine myself to the common colours employed to these last named two sorts of vessels, which colours are red, green, and sometimes blue, without mentioning the others, which require very little choice.

"Anatomists have, I imagine, proposed to imitate the natural colours of the arteries and veins in a living creature, by filling the arteries with a red substance, and the veins with a blue or green: from which, however, there are other advantages, such as the strong reflection which such bodies make of the rays of light, and the unaptness most such bodies have to transmit these same rays, without at least a considerable reflection of the rays peculiar to themselves; or, in other words, their unfitness to become completely pellucid; without which, the very fine vessels, after being injected, would still be imperceptible. The animal or vegetable substances made use of for colouring injections, such as cochineal, laque, *rad. archuse*, brazilwood, indigo, &c. have all one general fault of being liable to run into little knots which stop some of the vessels: their colour fades sooner when kept dry; they more easily yield their tincture when the parts are preserved in a liquor; and rats, mice, and insects, will take them for food: for which reasons, though I have frequently succeeded in injecting them, I rather prefer the mineral kind, such as minium or vermilion for red; of which this last is, in my opinion, the best, because it gives the brightest colour, and is commonly to be bought finely levigated. The green-coloured powder generally

(A) Rigierus (*Introduc. in notitiam rerum natur. &c.* 4^{to}, *Hagae*, 1743, *titul. Balsamum*) gives Ruyfch's method of injecting and preserving animals, which, he says, Mr Blumentroft, president of the Petersburg academy, assured him was copied from the receipt given in Ruyfch's own hand-writing to the Czar. According to this receipt, melted tallow, coloured with vermilion, to which, in the summer, a little white wax was added, was Ruyfch's injecting *ceracia materies*.

(B) Mr Ranhy's injecting matter, as published by Dr Hales, (*Hemast. Ex. 21*) is white rosin and tallow, of each two ounces, melted and strained through linen; to which was added three ounces of vermilion, or finely ground indigo, which was first well rubbed with eight ounces of turpentine varnish.

Injection. generally used is verdigrise; but I rather choose that preparation of it called *distilled verdigrise*; because its colour is brighter, and it does not so often run into small knots as the common verdigrise, but dissolves in the oily liquors.

“ The method of preparing the injection composed of these materials, is to take for the fine one, a pound of clear oil of turpentine, which is gradually poured on three ounces of vermilion, or distilled verdigrise finely powdered, or rather well levigated by grinding on marble; stir them well with a small wooden spatula till they are exactly mixed, then strain all through a fine linen rag. The separation of the grosser particles is, however, rather better made, by pouring some ounces of the oil upon the powder, and after stirring them together strongly, stop rubbing with the spatula for a second or so, and pour off into a clean vessel the oil with the vermilion or verdigrise suspended in it; and continue this sort of operation till you observe no more of the powder come off; and all that remains is granulated. The coarser injection is thus prepared: Take tallow, 1 pound; wax, bleached white, 5 ounces; salad oil, 3 ounces: melt them in a skillet put over a lamp: then add Venice turpentine, 4 ounces; and as soon as this is dissolved, gradually sprinkle in of vermilion or verdigrise prepared, 3 ounces; then pass all through a clean, dry, warmed linen-cloth, to separate all the grosser particles; and, when you design to make it run far into the vessels, some oil of turpentine may be added immediately before it is used.

“ The next thing to be considered, and indeed what chiefly contributes to the success of injections, is the choice and preparation of the subject whose vessels are to be filled.

“ In choosing a fit subject, take these few general rules: 1. The younger the creature to be injected is, the injection will. *ceteris paribus*, go farthest, and *vice versa*. 2. The more the creature's fluids have been dissolved and exhausted in life, the success of the operation will be greater. 3. The less solid the part designed to be injected is, the more vessels will be filled. 4. The more membranous and transparent parts are, the injection flows better; whereas, in the solid very hard parts of a rigid old creature, that has died with its vessels full of thick strong blood, it is scarcely possible to inject great numbers of small vessels.

“ Therefore, in preparing a subject for injecting, the principal things to be aimed at are, To dissolve the fluids, empty the vessels of them, relax the solids, and prevent the injection's coagulating too soon. To answer all these intentions, authors have proposed to inject tepid or warm water by the arteries till it returns clear and untinged by the veins, and the vessels are thereby so emptied of blood, that all the parts appear white; after which, they push out the water by forcing in air; and lastly, by pressing with their hands, they squeeze the air also out. After this preparation,

one can indeed inject very fruitfully; but generally there are inconveniences attend it. For in all the parts where there is a remarkable *tunica cellulosa*, it never fails to be full of the water, which is apt to spoil any parts designed to be preserved either wet or dry; and some particles of the water seldom miss to be mixed in the larger as well as smaller vessels with the oily injection, and make it appear discontinued and broken: wherefore it is much better to let this injection of water alone, if it can be possibly avoided, and rather to macerate the body or part to be injected a considerable time in water, made to warm (C) as one can hold his hand easily in it; taking care to keep it of an equal warmth all the time, by taking out some of the water as it cools, and pouring in hot water in its place; by which the vessels will be sufficiently softened and relaxed, the blood will be melted down, and the injection can be in no danger of hardening too soon; whereas, if the water is too hot, the vessels shrink, and the blood coagulates. From time to time we squeeze out the liquids as much as possible at the cut vessel by which the injection is to be thrown in (D). The time this maceration is to be continued, is always in proportion to the age of the subject, the bulk and thickness of what we design to inject, and the quantity of blood we observe in the vessels, which can only be learned by experience; at least, however, care ought to be taken, that the whole subject, or part macerated, is perfectly well warmed all through; and that we continue the pressure with our hands till no more blood can be brought away, whatever position we put the subject in.

When the syringe, injections, and subjects, are all in readiness, one of the second sort of pipes is chosen, as near to the diameter of the vessel by which the injection is to be thrown as possible; for if the pipe is too large, it is almost needless to tell it cannot be introduced. If the pipe is much smaller than the vessel, it is scarce possible to tie them so firmly together, but, by the wrinkling of the coats of the vessel, some small passage will be left, by which part of the injection will spring back on the injector in the time of the operation, and the nearest vessels remain afterwards undistended, by the loss of the quantity that oozes out. Having chosen a fit pipe, it is introduced at the cut orifice of the vessel, or at the incision made in the side of it; and then a waxed thread being brought round the vessel, as near to its coats as possible, by the help of a needle, or a flexible eyed probe, the surgeon's knot is made with the thread, and it is drawn as firmly as the thread can allow; taking care that it shall be sunk into the circular notch of the pipe all around, otherwise it will very easily slide off, and the pipe will be brought out probably in the time of the operation, which ruins it.

“ If there have been large vessels cut, which communicate with the vessels you design to inject, or if there are any others proceeding from the same trunk, which

(C) Ruyfch orders a previous maceration for a day or two in cold water; which must have a better effect in melting the blood than warm water has.

(D) When Ruyfch intended to inject the whole body, he put one pipe upwards, and another downwards, in the descending aorta.

Injection. which you do not resolve to fill, let them be all carefully now tied up, to save the injected liquor, and make the operation succeed better in the view you then have.

“When all this is done, both sorts of injections are to be warmed over a lamp, taking care to stir them constantly, lest the colouring powder fall to the bottom and burn (E). The oil of turpentine needs be made no warmer than will allow the finger to remain in it, if the subject has been previously well warmed in water; when the maceration has not been made, the oil ought to be scalding hot, that it may warm all the parts which are designed to be injected. The coarse injection ought to be brought near to a boiling. In the mean time, having wrapt several folds of linen round the parts of the syringe which the operator is to gripe, and secured the linen with thread, the syringe is to be made very hot by sucking boiling water several times up (F), and the pipe within the vessel is to be warmed by applying a sponge dipped in boiling water to it (G).

“After all is ready, the syringe being cleared of the water, the injector fills it with the finer injection; and then introducing the pipe of the syringe into that in the vessel, he presses them together, and either with one hand holds this last pipe firm, with the other gripes the syringe, and with his breast pushes the sucker; or, giving the pipe in the vessel to be held by an assistant, in any of the ways mentioned in the description of these sorts of pipes, he gripes the syringe with one hand, and pushes the sucker with the other, and consequently throws in the injection, which ought to be done slowly, and with no great force, but proportioned to the length and bulk of the part to be injected and strength of the vessels. The quantity of this fine injection to be thrown in is much to be learned by use. The only rule I could ever fix to myself in this matter was to continue pushing till I was sensible of a stop which would require a considerable force to overcome. But this will not hold where all the branches of any vessel are not injected; as for instance, when the vessels of the thorax only are to be injected: for the aorta bears too great a proportion to the branches sent from it, and therefore less fine injection is requisite here. As soon as that stop is felt, the sucker of the syringe is to be drawn back, that the nearest large vessels may be emptied. Then the syringe is taken off, emptied of the fine injection, and filled with the coarser, which is to be pushed into the vessels quickly and forcibly, having always regard to the strength and firmness of the vessels, bulk, &c. of the part. Continue to thrust the sucker, till a full stop, or a sort of push backwards, is felt, when you must beware of thrusting any more, otherwise some of the vessels will be burst, and the whole, or a considerable share of the preparation you designed, will be spoiled by the extravasation; but rather immediately stop the pipe by the turn-cock, and

take out the syringe to clean it, and allow sufficient time for the coarse injection to coagulate fully, before any part is dissected. Ruysch, immediately after throwing in the injection, put the body into cold water, and stirred it continually for some time, to prevent the vermilion to separate from the tallow.”

II. The injection of the *lymphatic* system is much more difficult than that of the sanguiferous, on account of the extreme smallness of the vessels; so that till very lately it was almost quite impracticable. Methods indeed had been attempted for this purpose; but by reason of the improper form of the instruments, and the inferior skill of anatomists in former times, we may justly look upon this as one of the most modern improvements in anatomy.

The first thing to be considered, when the lymphatics are to be injected, is a proper method of discovering them; for this is by no means an easy matter, on account of their smallness and transparency.—To find out these vessels, the subject must be viewed in a proper place, where the light is neither very strong nor very weak. Mr Sheldon, who has written a treatise upon this subject, recommends a winter forenoon from ten to two; it being chiefly in the winter season that anatomical preparations are made, and because at that time of the day the light is more clear and steady. He says also, from his own experience, that the light passing through the glass of a window is better for this purpose than the open air, as the vessels are more distinctly seen. The injecting of the vessels is likewise rendered more difficult in the open air by the ease with which the humidity is evaporated from them. It will likewise be necessary to incline the part in various ways to the light, as some of the vessels are most easily discoverable in one position and some in another. The lacteal trunks under the peritoneal coats of the intestines, and the lymphatics on the external surface of the liver, &c. particularly require this method. He discommends the use of magnifying glasses. “I am persuaded (says he), that those who attempt to find them through this medium will not acquire that *visus eruditus* which is obtained to a surprising degree by those who have been much experienced in injecting lymphatic vessels. A lateral light is likewise preferable to a horizontal, or even to an oblique sky-light.

“The subjects must be laid upon a table of sufficient height, which might be contrived with a ledge fixed to the table in such a manner as to be water-proof; which would be useful for preventing the quicksilver, which is almost always necessary for injecting these vessels, from being lost. The surface of the table should likewise be hollowed, so that the mercury which falls may be collected in the middle, where a hole with a stopper may be made to take out occasionally the quicksilver which collects. Such a table would also be convenient for holding water for the purpose of steeping membranous parts which are frequently to be injected; and

(E) Ruysch melts his tallow by the heat of warm water, into which he puts the vessel containing the injection.

(F) He warms his syringe by laying it on hot coals.

(G) He warms his pipe, by putting the body, after the pipe is fixed in the vessel, into hot water. When this is to be done, a cork ought to be put into the pipe, to prevent the water getting into the vessel that is to be injected.

Injection. and which, from being exposed to the air, become dry; which also it is inconvenient and hazardous to move into water during the time of operation. Even a common table with a hole cut in the middle may answer the purpose: the hole may be round or square according to the fancy of the anatomist; but the table must be constructed of such materials as are not liable to warp in warm water. Should the anatomist not be provided with either of these tables, the parts must be laid in a tray or earthen dish, that the quicksilver may be saved."

The materials for injecting these vessels are only quicksilver, and the ceraceous or *coarse* injection of anatomists; the former being always used in injecting the lymphatics and lacteals, it being almost impossible to fill them with another fluid in the dead body. The ceraceous injection is chiefly used for the thoracic duct; and in some particular instances, where the lymphatic trunks have been found larger than the ordinary size, a coarse injection has been made use of.

Injections of the lymphatics may be made even while the animal is alive, and that without any great cruelty, by feeding it with milk previous to its being strangled. Of all the barbarous methods of opening the animal while alive, the most useful seems to be that of Mr Hunter, who directs to perforate the small intestines, and throw in starch-water with solutions of musk, or indigo and starch-water. "In a word (says Mr Sheldon), any gelatinous fluids rendered opaque with such colours as will be absorbed, are extremely useful for experiments of this kind; for much more may be seen by examining the vessels distended with a coloured fluid from natural absorption, than by anatomical injection practised in the dead body." Lieberkuhn first discovered the ampullulæ by feeding children in whom the lacteal glands were obstructed previous to their death with milk; by which means not only the lacteal trunks became distended with chyle, but likewise the ampullulæ. Thus absorbing mouths of the lacteal vessels were discovered by Lieberkuhn; and in a similar manner Afellius discovered the lacteals themselves. Thus also Eustachius discovered the thoracic duct in a horse; and Mr Hewson traced the lacteal vessels, lymphatics, and thoracic duct, in birds, by making ligatures on the root of the mesentery, and other parts, which had been previously fed with barley. Mr Hunter likewise was enabled to observe the lacteals of a crocodile when distended with chyle.

The coarse injection for the lymphatics is made of mutton-suet and yellow resin, in the proportion of two thirds of resin to one of suet. If required of a thicker consistence, we may add a small quantity of pure wax: if of a softer quality, we may augment the quantity of suet: Orpiment or king's yellow is generally made use of; though others are equally proper, provided they be fine enough.

The instruments necessary for injecting the lymphatic vessels are the injecting tube and pipes, lancets, blow-pipes, knives, scissors, forceps, needles, and thread. The old injecting tube has been found in a manner entirely useless, the pipe being fixed in a glass tube two or three feet long; which is one of the reasons why, before the time of Hewson, so little of the lymphatic

system could be injected. Tubes of such a length are entirely unmanageable by one person, and it is impossible to perform the operation properly with two. To perform it in the best manner, the instrument should be held in the hand like a pencil or pen. The instruments used by our author are tubes made either of glass or of brass; which, when filled with mercury, may be held in the hand like a pen: a glass tube, however, is preferable to the metallic one. It is somewhat in the shape of a trumpet; six inches and a half in length, an inch and a half broad where broadest, and three-eighths of an inch where narrowest. A collar of steel half an inch broad and three quarters of an inch long is cemented to this pipe, and a smaller tube of the same metal is screwed upon the end of the collar; the whole terminating in a capillary tube about an inch in length. This last is the most difficult part of the whole work to execute; it should be drilled out of a solid piece of metal, and not made of a thin bit of plate foldered, as these are apt to turn ragged in the edges, and the solder is also liable to be destroyed by the mercury. Those used by Mr Sheldon were made by drilling a small hole lengthwise through a bit of well-tempered wire. It is cleaned by means of a very small piece of steel-wire capable of passing through the bore of the tube. This ought to be annealed lest it should break; in which case the broken bit could not easily be got out. Very small tubes may be made of glass drawn out as fine as we choose; and though very apt to break, they are easily repaired. They ought to be very thin, that they may be easily melted. Sometimes it has been found convenient to fit the collar with a steel stop-cock.

The brass tube represented by our author is about nine inches and a half in length, and half an inch wide where widest. The collar is a full quarter of an inch broad, and three quarters of an inch long; a steel piece and capillary tube being screwed to it as in the other.

The lancets are to be exquisitely sharp, in order to cut into the lymphatic vessels. The latter are easily inflated by the small silver blow-pipes usually put up in the dissecting cases by the London mathematical instrument makers: dissecting knives, fine-pointed scissors, accurately made dissecting forceps, with straight or crooked needles, are likewise substituted with advantage, as not being affected by the quicksilver.

We must next consider the proper subjects for injection. Mr Sheldon recommends, that they should be as free from fat as possible: he has always found in the human subject those who died universally dropsical, or of an ascites or anasarca, to be the best, for the following reasons, viz. in such there is little or no animal oil, and but a very small quantity of red blood; both of which, when they occur in great abundance, very much impede the discovery of the lymphatic vessels; but when the cellular vessels are loaded with water, the absorbents are more readily traced, and with less risk of wounding them in dissection: the preparations also, particularly the dried ones, are more lasting. This circumstance is found to be of most consequence in preparing the absorbent vessels of the trunk and extremities of the human subject. Of all the viscera in young subjects, only the liver and lungs can be injected with success; and these may be successfully injected even in the fetus. It will be most proper to begin the operation

Injection. tion upon the subject immediately after death, as lymph or chyle will then be more readily found in the vessels, than when we wait a longer time. In preparing the lacteals, previously distended with milk in the living subject, it is proper to have the intestines and mesentery plunged (with the ligature upon the root of the latter) into rectified spirit of wine. This process will coagulate the chyle; and the fluid being opaque, the vessels will be beautifully seen when we mean to prepare the parts, by preserving them in proof-spirit, as wet specimens: "In this way (says Mr Sheldon) I have made in the dog one of the most natural preparations that can be seen of the lacteals injected from their orifices by the natural absorption." We may also prepare the lacteals by the method used by Mr Hunter, already mentioned; by which they will be very conspicuous, by the indigo absorbed from the cavity of the intestines. By tying the thoracic duct near its insertion into the angle formed between the subclavian and jugular veins on the left side, or by tying these veins on both sides, we may distend almost all the absorbents of the animal. Thus we are enabled to pursue these vessels in many parts where they have not yet been discovered, where they can scarcely be traced by injection, and even in some parts where it is utterly impossible for the injections to reach them.

Another method, sometimes successfully used by our author, was first practised by Malpighi. In this the part is to be steeped in water, and the liquid changed as long as it appears tinged with blood; suffering the parts afterwards to remain in the same water till the putrefaction begins. As soon as this begins to take place, the air which is extricated will distend the lymphatics, so that they may be easily seen, and then injected with quicksilver. It is, however, remarkable, that this method will not in general answer so well in the human species as in quadrupeds; the air having never passed by putrefaction into the human lacteals in any of the subjects which Mr Sheldon tried, though it will take place in those of the horse or ass, and many other animals: drawing of the lacteals may likewise be made in this method to very great advantage. In some parts of the human body also this method may be employed to advantage; as the liver, heart, &c. It may likewise be useful to make ligatures on the large trunks of the vessels previous to the maceration, that thus the air may be confined as soon as it is extricated from the coats by putrefaction. Our author adds, that if ligatures were made upon the wrists and legs in *articulo mortis*, or immediately after death, the lymph would be stopped in the vessels, the latter would become distended, and might be injected with the greatest facility by the common method after taking off the ligature. Mr Sheldon in such a case recommends the tourniquet. "I have reason (says he) to believe, that absorption goes on as long as muscular irritability remains; which last continues a considerable time after the general life of the animal is lost." On this, however, we cannot forbear to remark, that making ligatures for such purposes upon a human creature in *articulo mortis*, or even immediately after death, favours so much of *barbarity*, that we cannot think it will be often practised. In some cases, even in the dead subject, ligatures are useful; as when we are searching for the lymphatics in the fingers and toes.

In these it is useful to stroke up the parts with the finger, by which means the small quantity of lymph remaining in the vessels will be forced upwards, and stopped by the ligature; after which the vessels may be easily injected with quicksilver, as already mentioned.

To inject the vessels, we must open one or more of them, directing the point of the lancet almost always towards the trunk or trunks of the vessels, and taking care not to carry the incision through the opposite side. If the vessels happen to lie under the peritoneum as the lacteals, or under the pleura as the lymphatics of the lungs, we may cut into their cavity through these membranes. In injecting those of the extremities, however, and in many other parts of the body, it is absolutely necessary to dissect the vessels we design to fill away from the fat and reticular substance before we attempt to open them with the lancet. The tube with the pipe affixed to it is previously to be filled with mercury: the anatomist then inflates the vessel by means of the blow-pipe, takes the tube from the assistant, and introduces the small tube into the puncture. In this operation it will be found necessary not to carry the tube farther into the vessel than is sufficient to give the mercury a free passage; for if we introduce it farther, the passage of the mercury will be impeded by the pipe being pushed against the side of the vessel. Should not the fluid be able to effect a passage, it will then be necessary to press upon the surface of it in the tube with our fingers. If it descend freely, and without any of it passing between the side of the vessel and small pipe, we have only to fill up the tube with mercury as the latter descends; but if it gets out, we must then tie the vessel. This, however, should always be avoided if possible; because, if not very dexterously performed, the operator will be apt to separate the tube from the vessel; and on this account the puncture ought always to be very small, no larger indeed than is necessary to allow the pipe to get in with difficulty. As the injection proceeds, the pressure upon the surface of the quicksilver must be carried on higher and higher in the course of the lymphatic, till we come near the gland or glands into which the vessels terminate; otherwise we shall seldom get the cells of the glands, or the vessels emerging from the opposite side of the glands, well injected. In injecting the lymphatic vessels of the extremities, it will be useful to raise the part where the pipe is inserted higher than the other end of the limb, and to make the assistant press with his hands along the skin in the course of the vessels, which will favour the progress of the injection. When the vessels are sufficiently filled, which may be known by the swelling of them, and by the resistance the mercury meets with, the assistant passes a ligature about the vessel and ties it above the puncture before the anatomist withdraws the injection-pipe.

The method of injecting the larger trunks or thoracic duct with the coarse injection is exactly similar to that already described for the sanguiferous vessels. Mr Sheldon, however, recommends the use of some pipes of a particular construction invented by himself. The improvement consists in shaping the ends of the pipes like a pen; taking care to make the edges and point blunt, to avoid cutting the vessel when we introduce them. Thus much larger tubes than those com-

Injection. monly in use may be admitted; and there is no occasion to make any bulb or rising near the extremity of these small pipes to prevent the thread from slipping off: for this will certainly hinder us from inserting pipes of such diameter as might otherwise be done.

Having thus shown the method of injecting the lymphatics, our author next proceeds to describe the method of dissecting and preparing them either for immediate demonstration, or for preservation for any length of time. In the dissection, great care is requisite, on account of the exquisite thinness of their coats: but if this should happen by accident, it will then be necessary to introduce the pipe at the ruptured part; and having secured it above and below with ligatures, to fill it again as before directed. Our author recommends, for the purpose of dissection, such knives as are made use of by the Germans and French in tracing the nerves. They must be made thin in the blade like lancets, and not much larger. A variety of different shaped blades, some single and others double edged, will be necessary for various parts of the body; the fault of the common dissecting knives being that they are too thick in the blade, which makes them soon blunt, and occasions the trouble of perpetual grinding, which is not the case with those just recommended. A sharp-pointed forceps is necessary, in order to lay fast hold of the smallest portion of cellular substance; but they ought not to be so sharp as to endanger the puncturing of the vessels: nor should they by any means be bowed or stiff in the spring, to prevent the fingers of the operator from being wearied in the operation. They should also be made in such a manner as to hold large as well as small portions of reticular substance. For dissections of this kind, fine-pointed scissars and lancets fixed in handles are sometimes necessary; and it is frequently of use to plunge the parts into water, in order to loosen the reticular membrane connected with the outside of the coats of the vessels; by which means they may be dissected more easily, and with less danger of wounding them. The blood may be extracted by frequently changing the water. After being injected with quicksilver, the parts should not be allowed to remain long in the water, because the volatile alkali formed by putrefaction is apt to change the colour of the mercury.

The dissection being performed, the preparation is then to be preserved either in a wet or dry state, according to its nature. Preparations of the larger parts, as the trunk or extremities, should be preserved dry; and to dry them effectually, they should be exposed to a free current of air, but not to the rays of the sun; and the vessels should be displayed in their natural situation. When fully dried, they ought then to be varnished over with transparent spirit or copal varnish: which will not only preserve them from insects, but render them more beautiful, and the vessels more conspicuous. They should then be inclosed in glass cases, where they are to be placed in a horizontal position, and handled as little as possible.

To make preparations of the thoracic duct, we must in the first place fill the aorta, vena cava superior, and vena azygos or intercostalis, with coarse injection; then fill, with the same, the vessels below the right crus or little muscle of the diaphragm. The duct is sometimes prepared with quicksilver; but Mr Sheldon recommends to anatomists to make drawings of any

thing new or remarkable in their preparations of the lymphatic vessels with quicksilver; as most of those specimens, particularly such as are dried, become at last totally useless by reason of the drying of the vessels and the escape or blackening of the mercury; or from the varnish growing more and more opaque with age. The quicksilver injection, however, in some cases is very useful. Thus, for instance, if we wish to demonstrate the valves in the thoracic duct, or any other large absorbent vessel, we need only inject the vessels with quicksilver, dissect and dry them, then cut them open, and let the mercury run out: after which the valves will appear by making sections in the coats of the vessels. This may be done still better by varnishing the vessels three or four times before the sections are made; because the varnish will strengthen the sides of the vessel. In wet preparations the valves in the cavities of these parts may likewise be demonstrated by opening them; or by inverting the vessels and suspending them in proof malt-spirits. Thus the valves that cover the terminations of the thoracic duct on the inside of the angle formed between the jugular and subclavian veins on the left side, and those which terminate the lymphatics on the right side of the neck, arm, and lungs, may be beautifully demonstrated. Specimens of the lacteal vessels, of the absorbents of the heart, lungs, liver, spleen, diaphragm, kidneys, &c. may be kept wet or dry, according to the particular nature of the preparation or view of the anatomist. Some preparations are the better for being dried and afterwards immersed in phials full of oil of turpentine; by which means the flesh will be rendered transparent, the vessels distinctly seen, and the vessels appear extremely beautiful. The only disadvantage of this method is, that the parts on which the vessels pass, do not at all preserve their natural bulk by reason of their shrinking up; and as the wet preparations are free from this inconvenience, Mr Sheldon does not hesitate at assigning them a decided superiority over the dry ones.—Sometimes it is necessary to fix the preparations upon stiff paper or pasteboard, on account of their weight after being injected with mercury. The paper or pasteboard on which they are fastened ought to be of various colours, according to the nature of the preparation, in order to form a proper ground for showing the lymphatic vessels. Such small preparations as are preserved in spirits, or oil of turpentine, may be kept in bottles well closed with stoppers; and the larger in common preparation glasses. Our author describes a simple method of stopping the mouths of these preparation glasses, by which means the stopper is rendered nearly as durable as the glass itself. “In order to execute it, let the anatomist take care to have the upper surface of his bottles made plain, by desiring the workmen at the glass-house to flatten them in the making. This they will easily do in forming the round ones, but the flat bottles are attended with considerable difficulty. The right way to make them, I believe, would be to blow them in moulds of various sizes; the workman should likewise form the bottoms of the bottles perfectly flat, that they may stand upright and steady. Bottles of this form being provided for the larger preparations, we grind the upper surface of them on a plain plate of lead, about a quarter of an inch thick, and two feet in diameter; first with fine emery and wa-

Injection. ter, then with powdered rotten stone, or putty first wet with water and at last dry; so that the surface may be reduced to an exact horizontal plane, and of as fine a polish as plate-glass. This will soon be done, as the manœuvre requires but little dexterity; and the anatomist should be provided with a considerable number of these glasses prepared as above directed. To the top of each bottle a piece of plate-glass, cut by a diamond, is to be adapted so as completely to cover, but not project over, the edge of the bottle. When these two smooth surfaces are put upon each other, with a drop of water between, the attraction of cohesion is so considerable, that it requires great force to separate them."

Many preparations of the lymphatics, and other parts preserved in bottles, do not require any strings to suspend them; particularly when fixed on pasteboard or paper: such as require suspension should be tied to strings fixed to the preparation below, and to small holes drilled in the substance of the glass at the bottom of the neck; or to small bits of glass that may be fixed on the inside of the same part. The preparation is thus suspended in limpid proof malt-spirit, the bottle being almost completely filled; the upper and polished surface of the bottle, and the plate of glass, are to be wiped clean and dry; a drop of solution of gum arabic is to be put on the polished surface of the bottle, the top strongly and steadily pressed upon it, so as to bring the two surfaces into as close contact as possible; after which the bottle is to be placed in a cool airy place to dry. A piece of wet ox-bladder, freed from fat, and soaked in water till it becomes mucilaginous, is then to be placed over the top, the air pressed out from between it and the glass; after which it must be tied with a packthread dipped in the solution of gum arabic. The bladder being cut off neatly under the last turn of the thread, is then to be dried, the string taken cautiously off, and the top and neck painted with a composition of lamp-black mixed with japanners gold size: this soon dries, and leaves a fine smooth glossy surface, from which the dirt can at any time be as readily wiped off as from a mirror. By this method large bottles are as easily and effectually secured as small ones; and it is found to answer as well as the hermetical sealing of glasses, which in large vessels is altogether impracticable. If the bottoms have any inequalities which prevent them from standing steady, they may be easily made perfectly flat by grinding them with emery on the plate above-mentioned. The tops, if well gummed, will even remain perfectly fixed on the glasses without the bladder: though in the common upright ones it may be advisable to put it on as a defence. Our author informs us, that since his making this discovery, he has used glass saucers; with flat tops gummed on. In these vessels the preparations, by reason of their horizontal posture, appear to great advantage. Thus he has exhibited very early abortions in their membranes, and some other preparations that cannot be suspended or viewed conveniently in the perpendicular direction. Some very delicate preparations, particularly those intended to be viewed with the microscope, those of the ampullæ hæmæ of Lieberkuhn, and of the valves of the absorbents, may be preserved either in spirits or dry in tubes closed in the manner just mentioned, and will

appear to great advantage. Some of the dry ones may also be advantageously placed in square oblong boxes, made of pieces of plate or white glass neatly gummed together, with narrow slips of white or coloured paper, and the objects may be conveniently viewed in this manner. With respect to the stopper bottles, which are very convenient for holding small preparations, our author advises the stoppers to be perfectly well ground; that they pass rather lower down than the neck of the bottle for the convenience of drilling two holes obliquely through the inferior edge of the substance of the stopper, opposite to each other, for the convenience of fixing threads to hold the subject; for if the threads pass between the neck and stopper, a space will be left; or if the stopper be well ground, the neck of the bottle will be broken in endeavouring to press it down. On the other hand, if any space be left, the thread, by its capillary attraction, will act from capillary attraction, raise the spirits from the bottle, and cause evaporation, which will likewise take place from the chink between the stopper and neck.

INISTIOGE, a post town of Kilkenny, in the province of Leinster; 63 miles from Dublin. It is also a borough, and returns two members to parliament; patronage in the representative of Sir William Fownes.— It has two fairs.

INITIATED, a term properly used in speaking of the religion of the ancient heathens; where it signifies being admitted to the participation of the sacred mysteries. The word comes from the Latin *initiatum*, of *initiare, initiari*; which properly signifies to begin sacrificing, or to receive or admit a person to the beginning of the mysteries, or of ceremonies of less importance.

The ancients never discovered the deeper mysteries of their religion, nor even permitted some of their temples to be open, to any but those who had been initiated. See **MYSTERY**.

INJUNCTION, in *Law*, a writ generally grounded upon an interlocutory order or decree out of the court of chancery or exchequer, sometimes to give possession to the plaintiff, for want of the defendant's appearance; sometimes to the king's ordinary court, and sometimes to the court-christian, to stop proceedings in a cause, upon suggestion made, that the rigour of the law, if it take place, is against equity and conscience in that case, that the complainant is not able to make his defence in these courts, for want of witnesses, &c. or that they act erroneously, denying him some just advantage. The writ of injunction is directed not only to the party himself, but to all and singular his counsellors, attorneys, and solicitors; and if any attorney, after having been served with an injunction, proceeds afterward contrary to it, the court of chancery will commit the attorney to the Fleet for contempt. But if an injunction be granted by the court of chancery in a criminal matter, the court of king's bench may break it, and protect any that proceed in contempt of it.

INJURY, any wrong done to a man's person, reputation, or goods. See **ASSAULT**.

INK, a black liquor used in writing, generally made of an infusion of galls, copperas, and gum-arabic.

The properties which this liquor ought to have, are,

Ink.

1. To flow freely from the pen, and sink a little into the paper, that the writing be not easily discharged. 2. A very deep black colour, which should be as deep at first as at any time afterwards. 3. Durability, so that the writing may not be subject to decay by age. 4. Ink should be destitute of any corrosive quality, that it may not destroy the paper, or go through it in such a manner as to render the writing illegible. No kind of ink, however, hath yet appeared which is possessed of all these qualities. The ink used by the ancients was possessed of the second, third, and fourth qualities above-mentioned, but wanted the first. Dr Lewis hath discovered its composition from some passages in ancient authors. "Pliny and Vitruvius (says he) expressly mention the preparation of foot, or what we now call *lamp-black*, and the composition of writing-ink from lamp-black and gum. Dioscorides is more particular, setting down the proportions of the two ingredients, viz. three ounces of the foot to one of the gum. It seems the mixture was formed into cakes or rolls; which being dried in the sun, were occasionally tempered with water, as the cakes of Indian ink are among us for painting."

In Mr Delaval's Treatise on Colours, p. 37. he acquaints us, that with an infusion of galls and iron filings, he had not only made an exceedingly black and durable ink, but by its means, without the addition of any acid, dyed silk and woollen cloth of a good and lasting black. This kind of ink, however, though the colour is far superior to that of any other, has the inconvenience of being very easily discharged, either by the smallest quantity of any acid, or even by simple water; because it does not penetrate the paper in such a manner as is necessary to preserve it from the instantaneous action of the acid or of the water. During the action of the infusion of galls upon the iron in making this kind of ink, a very considerable effervescence takes place, and a quantity of air is discharged, the nature of which has not yet been examined.

The materials usually employed for the making of ink are, common green vitriol, or copperas and galls; but almost all of them are deficient in durability, which is a property of such importance, that Dr Lewis hath thought the subject of ink-making not unworthy of his attention. From experiments made by that author, he infers, that the decay of inks is chiefly owing to a deficiency of galls; that the galls are the most perishable ingredient, the quantity of these, which gives the greatest blackness at first (which is about equal parts with the vitriol), being insufficient to maintain the colour: that, for a durable ink, the quantity of galls cannot be much less than three times that of the vitriol; that it cannot be much greater without lessening the blackness of the ink: that by diminishing the quantity of water, the ink is rendered blacker and more durable; that distilled water, rain-water, and hard spring-water, have the same effects: that white wine produces a deeper black colour than water; that the colour produced by vinegar is deeper than that by wine; that proof-spirit extracts only a reddish brown tinge; that the last-mentioned tincture sinks into, and spreads upon, the paper; and hence the impropriety of adding spirit of wine to ink, as is frequently directed, to prevent mouldiness or freezing: that other astringents, as oak-

bark, bistort, floc-bark, &c. are not so effectual as galls, nor give so good a black, the colour produced by most of these, excepting oak-bark, being greenish: that the juice of shoes does not produce a black colour with martial vitriol; but that, nevertheless, the writing made with it becomes black, and is found to be more durable than common ink: that inks made with saturated solutions of iron, in nitrous, marine, or acetic acids, in tartar, or in lemon juice, were much inferior to the ink made with martial vitriol: that the colour of ink is depraved by adding quicklime, which is done with an intention of destroying any superabundant acid which may be supposed to be the cause of the loss of the colour of ink: that the best method of preventing the effects of this superabundant acid is probably by adding pieces of iron to engage it; and that this conjecture is confirmed by an instance the author had heard, of the great durability of the colour of an ink in which pieces of iron had been long immersed: and lastly, that a decoction of logwood used instead of water, sensibly improves both the beauty and deepness of the black, without disposing it to fade. The same author observes, that the addition of gum-arabic is not only useful, by keeping the colouring matter suspended in the fluid, but also by preventing the ink from spreading, by which means a greater quantity of it is collected on each stroke of the pen. Sugar, which is sometimes added to ink, is found to be much less effectual than gums, and to have the inconvenience of preventing the drying of the ink. The colour of ink is found to be greatly injured by keeping the ink in vessels made of copper or of lead, and probably of any other metal, excepting iron, which the vitriolic acid can dissolve.

The foregoing experiments point out for the best proportions of the ingredients for ink. One part of green vitriol, one part of powdered logwood, and three parts of powdered galls. The best menstruum appears to be vinegar or white wine, though for common use water is sufficient. If the ink be required to be of a full colour, a quart, or at most three pints, of liquor, may be allowed to three ounces of galls, and to one ounce of each of the other two ingredients. Half an ounce of gum may be added to each pint of the liquor. The ingredients may be all put together at once in a convenient vessel, and well shaken four or five times each day. In 10 or 12 days the ink will be fit for use, though it will improve by remaining longer on the ingredients. Or it may be made more expeditiously, by adding the gum and vitriol to a decoction of galls and logwood in the menstruum. To the ink, after it has been separated from the feculencies, some coarse powder of galls, from which the fine dust has been sifted, together with one or two pieces of iron, may be added, by which its durability will be secured.

In some attempts made by the Doctor to endow writing ink with the great durability of that of the ancients, as well as the properties which it has at present; he first thought of using animal glues, and then of oily matters. "I mixed both lamp-black (says he) and ivory-black with solution of gum-arabic, made of such consistence as just to flow sufficiently from the pen. The liquors wrote of a fine black colour; but when

Ink.

when dry, part of the colour could be rubbed off, especially in moist weather, and a pencil dipped in water washed it away entirely.

"I tried solutions of the animal-glues with the same event. Ifinglass or fish glue being the most difficultly dissoluble of these kinds of bodies, I made a decoction of it in water, of such strength that the liquor concreted into a jelly before it was quite cold: with this jelly, kept fluid by sufficient heat, I mixed some ivory-black: characters drawn with this mixture on paper bore rubbing much better than the others, but were discharged without much difficulty by a wet pencil.

"It was now suspected, that the colour could not be sufficiently fixed on paper without an oily cement. As oils themselves are made miscible with watery fluids by the intervention of gum, I mixed some of the softer painters varnish, aftermentioned, with about half its weight of a thick mucilage of gum-arabic, working them well together in a mortar till they united into a smooth uniform mass: this was beaten with lamp-black, and some water added by little and little, the rubbing being continued till the mixture was diluted to a due consistence for writing. It wrote freely, and of a full brownish black colour: the characters could not be discharged by rubbing, but water washed them out, though not near so readily as any of the foregoing. Instead of the painters varnish or boiled oil, I mixed raw linseed oil in the same manner with mucilage and lamp-black; and on diluting the mixture with water, obtained an ink not greatly different from the other.

"Though these oily mixtures answered better than those with simple gums or glues, it was apprehended that their being dischargeable by water would render them unfit for the purposes intended. The only way of obviating this imperfection appeared to be, by using a paper which should admit the black liquid to sink a little into its substance. Accordingly I took some of the more sinking kinds of paper, and common paper made damp as for printing; and had the satisfaction to find, that neither the oily nor the simple, gummy mixtures spread upon them so much as might have been expected, and that the characters were as fixed as could be desired, for they could not be washed out without rubbing off part of the substance of the paper itself.

"All these inks must be now and then stirred or shaken during the time of use, to mix up the black powder, which settles by degrees to the bottom: those with oil must be well shaken also, though not used, once a-day, or at least once in three or four days, to keep the oil united with the water and gum; for, if once the oil separates, which it is apt to do by standing at rest for some days, it can no longer be mixed with the thin fluid by any agitation. But though this imperfect union of the ingredients renders these inks less fit for general use than those commonly employed, I apprehend there are many occasions in which these kinds of inconveniences will not be thought to counterbalance the advantage of having writings which we may be assured will be as lasting as the paper they are written upon. And indeed the inconvenience may be in a great measure obviated by using cotton in the ink-stand, which, imbibing the fluid, prevents the separation of the black powder diffused through it.

"All the inks, however, made on the principle we are now speaking of, can be discharged by washing, unless the paper admits them to sink into its substance. The ancients were not insensible of this imperfection; and sometimes endeavoured to obviate it, according to Pliny, by using vinegar, instead of water, for tempering the mixture of lamp-black and gum. I tried vinegar, and found it to be of some advantage, not as giving any improvement to the cement, but by promoting the sinking of the matter into the paper. As this washing out of the ink may be prevented by using a kind of paper easy enough to be procured, it is scarce to be considered as an imperfection; and indeed, on other kinds of paper, it is an imperfection only so far as it may give occasion to fraud, for none of these inks are in danger of being otherwise discharged than by design. The vitriolic inks themselves, and those of printed books and copperplates, are all dischargeable; nor can it be expected of the ink-maker to render writings secure from frauds.

"But a further improvement may yet be made, namely, that of uniting the ancient and modern inks together; or using the common vitriolic ink instead of water, for tempering the ancient mixture of gum and lamp-black. By this method it should seem that the writings would have all the durability of those of former times, with all the advantage that results from the vitriolic ink fixing itself in the paper. Even where the common vitriolic mixture is depended on for the ink, it may in many cases be improved by a small addition of the ancient composition, or of the common Indian ink which answers the same purpose: when the vitriolic ink is dilute, and flows so pale from the pen, that the fine strokes, on first writing, are scarcely visible, the addition of a little Indian ink is the readiest means of giving it the due blackness. By this admixture it may be presumed also that the vitriolic ink will be made more durable, the Indian ink in some measure covering it, and defending it from the action of the air. In all cases, where Indian ink or other similar compositions are employed, cotton should be used in the ink-stand, as already mentioned, to prevent the settling of the black powder."

Since the invention of printing much less attention than formerly has been paid to the making of ink, so that now the art seems to be in a great measure lost. This will appear from a comparison of some ancient manuscripts with the writings of modern times. It being of the utmost importance, however, that public records, wills, and other valuable papers, which cannot admit of being printed, should be written with ink of a durable quality, this inattention seems to have been very culpable, and a restoration of the method of making writing ink a very valuable acquisition. "The necessity (says Mr Aisle*) of paying greater attention to this matter may readily be seen, by comparing the rolls * Origin of Alphab. Writing. and records that have been written from the 15th century to the end of the 17th, with the writings we have remaining of various writings from the 5th to the 12th centuries. Notwithstanding the superior antiquity of the latter, they are in excellent preservation; but we frequently find the former, though of more modern date, so much defaced that they are scarcely legible."

Our author agrees with Dr Lewis in the opinion that

Ink.

that the ancient inks were composed of foot or ivory black instead of the galls, copperas, and gums, which form the composition of ours. Besides their black inks, however, the ancients used various other colours, as red, gold and silver, purple, &c. Green ink was frequently used in Latin manuscripts, especially in the latter ages; and it was frequently employed in signatures by the guardians of the Greek emperors till their wards were of age. Blue or yellow ink was seldom used except in manuscripts; but (says Mr Astle) "the yellow has not been much in use, as far as we can learn, these 600 years." Some kinds of characters, particularly the metallic, were burnished. Wax was used by the Latins and Greeks as a varnish, but especially by the former, and particularly in the 9th century. It continued a long time in vogue.

A treatise upon inks was published by Peter Caniparius professor of medicine at Venice; of which an edition was printed at London in 1660. It is divided into six parts. The first treats of inks made from pyrites, stones, and metals; the second of such as are made from metals and calces; the third from soots and vitriols; the fourth of the different kinds of inks used by the librarii or book-writers, by printers, and engravers; likewise of staining or writing upon marble, stucco, or scagliola, and of encaustic modes of writing; also of liquids for painting or colouring leather and linen or woollen cloth: restoring inks that had been decayed by time; together with many methods of effacing writing, restoring decayed paper, and different modes of secret writing. The fifth treats of writing inks made in different countries from gums, woods, the juices of plants, &c. as well as of different kinds of varnishes. The sixth treats of the different methods of extracting vitriol, and the chemical uses of it.

Weckerus de Secretis, a treatise printed at Basil in 1612, contains a number of curious particulars concerning ink. He gives also receipts for making gold and silver inks, composed both with these metals and without them; and directions for making inks for secret writing, and for defacing them; though in this last part there are many particulars bordering too much on the marvellous.

In the Philosophical Transactions for 1787, Dr Blagden gives some account of a method of restoring decayed inks so as to render them legible. His experiments originated from a conversation with Mr Astle already quoted, on the question whether the inks make eight or ten centuries ago, and which are found to have preserved their colour very well, were made of the same materials now employed or not? In order to decide the question, Mr Astle furnished the doctor with several manuscripts on parchment and vellum from the 9th to the 15th centuries inclusively. Some of these were still very black; others of different shades, from a deep yellowish brown to a very pale yellow, in some parts so faint that it could scarcely be seen. This was tried with simple and phlogisticated alkalies, the mineral acids, and infusion of galls. From these experiments it appeared that the ink anciently employed was of the same nature as at present: the letters turned of a reddish or yellowish brown with alkalies became pale, and were at length obliterated by the dilute mineral acids. The drop of acid liquor, which

had been put upon a letter, changed to a deep blue or green on the addition of phlogisticated alkalies; with an infusion of galls, in some cases the letters acquired a deep tinge, in others a slight one. "Hence says the doctor) it is evident, that one of the ingredients was iron, which there is no reason to doubt was joined with the vitriolic acid; and the colour of the more perfect MSS. which in some was a deep black, and in others a purplish black, together with the restitution of that colour in those which had lost it by the infusion of galls, sufficiently proved that another of the ingredients was astringent matter, which from history appears to have been that of galls. No trace of a black pigment of any sort was discovered; the drop of acid, which had completely extracted a letter, appearing of an uniform pale and ferruginous colour, without an atom of black powder, or other extraneous matter floating in it."

As this account differs very materially from the former extracted from Mr Astle's writings, so the reason given for the continuance of the colour differs no less. This, according to Dr Blagden, "seems to depend very much on a better preparation of the material upon which the writing was made, namely the parchment or vellum; the blackest letters being generally those which had sunk into it the deepest. Some degree of effervescence was commonly to be perceived when acids were in contact with the surface of these old vellums. I was led, however, to suspect, that the ancient inks contained rather a less proportion of iron than the more modern; for, in general, the tinge of colour produced by the phlogisticated alkali in the acid laid upon them, seemed less deep; which, however, might depend in part upon the length of time they have been kept: and perhaps more gum was used in them, or they were washed over with some kind of varnish, though not such as gave any gloss."

Among the specimens with which our author was favoured by Mr Astle, there was one which differed very materially from the rest. It was said to be a manuscript of the 15th century: the letters were of a full engrossing hand, angular without any fine strokes, broad, and very black. None of the chemical solvents above mentioned seemed to produce any effect. Most of them seemed rather to make the letters blacker, probably by cleaning the surface; and the acids, after having been rubbed strongly upon the letters, did not strike any deeper tinge with the phlogisticated alkali. Nothing could obliterate these but what took off part of the vellum; when small rolls of a dirty matter were to be perceived. "It is therefore unquestionable (says the doctor) that no iron was used in this ink; and, from its resistance to the chemical solvents, as well as a certain clotted appearance in the letters when examined closely, and in some places a slight degree of gloss, I have little doubt that they were formed of a sooty or carbonaceous powder and oil, probably something like our present printers ink; and am not without suspicion that they were actually printed."

On examining this MS. more fully, our author was convinced that it was really a part of a very ancient printed book. In considering the methods of restoring the legibility of decayed writings, our author observes, that perhaps one of the best may be to join phlogisticated alkali with the calx of iron which remains; because

cause the precipitate formed by these two substances greatly exceeds that of the iron alone. On this subject Dr Blagden disagrees with Mr Bergmann; but to bring the matter to a test, the following experiments were made.

1. The phlogisticated alkali was rubbed in different quantities upon the bare writing. This, in general, produced little effect; though, in a few instances, it gave a bluish tinge to the letters, and increased their intensity; "probably (says the doctor) where something of an acid nature had contributed to the diminution of their colour." 2. By adding, besides the alkali, a dilute mineral acid to the writing, our author found his expectations fully answered; the letters then changing quickly to a very deep and beautiful blue. It is but of little consequence whether the acid or phlogisticated alkali be first added; though upon farther consideration the doctor inclined to begin with the alkali. The reason is, that when the alkali is first put on, the colour seems to spread less, and thus not to hurt the legibility of the writing so much as would otherwise be done. His method is to spread the alkali thin over the writing with a feather, then to touch it as gently as possible upon or nearly over the letters with the diluted acid by means of a feather or bit of stick cut to a blunt point. The moment that the acid liquor is applied, the letters turn to a fine blue, beyond comparison stronger than the original trace of the letter; and by applying a bit of blotting-paper to suck up the superfluous liquid, we may in a great measure avoid the staining of the parchment: for it is this superfluous liquor which, absorbing part of the colouring matter from the letters, becomes a dye to whatever it touches. Care ought, however, to be taken not to allow the blotting paper to come in contact with the letters, because the colouring matter may easily be rubbed off while soft and wet. Any one of the three mineral acids will answer the purpose effectually. Dr Blagden commonly uses the marine. But whichever of the three is used, it ought to be diluted so far as not to be in danger of corroding the parchment; after which the degree of strength seems not to be a matter of great nicety.

Another method of restoring the legibility of old writings is by wetting them with an infusion of galls in white wine: but this is subject to the same inconvenience with the former, and is besides less efficacious. The doctor is of opinion that the acid of the galls by itself would be better for the purpose than the infusion of the whole substance of them; and he thinks also that a preferable kind of phlogisticated alkali might be prepared either by purifying the common kind from iron as much as possible, or by making use of the volatile alkali instead of the fixed. Mr Astle mentions a method of restoring the legibility of decayed writings; but says that it ought not to be hazarded lest a suspicion of deceit should arise.

A method has been proposed of preventing ink from decaying by washing over the paper to be written upon with the colouring matter of Prussian blue, which will

not deprave it in colour, or any other respect. By writing upon it with common ink afterwards, a ground of Prussian blue is formed under every stroke; and this remains strong after the black has been decayed by the weather, or destroyed by acids. Thus the ink will bear a larger proportion of vitriol at first, and will have the advantage of looking blacker when first written.

Indian Ink, a valuable black for water-colours, brought from China and other parts of the East Indies, sometimes in large rolls, but more commonly in small quadrangular cakes, and generally marked with Chinese characters. Dr Lewis, from experiments made on this substance, hath shown that it is composed of fine lamp-black and animal glue: and accordingly, for the preparation of it, he desires us to mix the lamp-black with as much melted glue as is sufficient to give it a tenacity proper for being made into cakes; and these when dry, he tells us, answered as well as those imported from the East Indies, both with regard to the colour and the freedom of working. Ivory black, and other charcoal blacks, levigated to a great degree of fineness, answered as well as the lamp-black; but in the state in which ivory-black is commonly sold, it proved much too gritty, and separated too hastily from the water.

Printing Ink, is totally different from Indian ink, or that made use of in writing. It is an oily composition, of the consistence of an ointment: the method of preparing it was long kept a secret by those whose employment it was to make it, and who were interested in concealing it; and even yet is but imperfectly known. The properties of good printing ink are, to work clean and easily, without daubing the types, or tearing the paper; to have a fine black colour; to wash easily off the types; to dry soon; and to preserve its colour, without turning brown. This last, which is a most necessary property, is effectually obtained by setting fire to the oil with which the printing ink is made for a few moments, and then extinguishing it by covering the vessel (A). It is made to wash easily off the types, by using soap as an ingredient; and its working clean depends on its having a proper degree of strength, which is given by a certain addition of rosin. A good deal, however, depends on the proportion of the ingredients to each other; for if too much soap is added, the ink will work very foul, and daub the types to a great degree. The same thing will happen from using too much black, at the same time that both the soap and black hinder the ink from drying; while too much oil and rosin tear the paper, and hinder it from washing off.—The following receipt has been found to make printing ink of a tolerable good quality. "Take a Scots pint of lintseed oil, and set it over a pretty brisk fire in an iron or copper vessel capable of holding three or four times as much. When it boils strongly, and emits a thick smoke, kindle it with a piece of paper, and immediately take the vessel off the fire. Let the oil burn for about a minute; then extinguish it by covering the vessel; after it has
grown

(A) This is mentioned by Dr Lewis in his Philosophical Commerce of Arts; but he seems not to have been acquainted with the method of giving it the other necessary properties.

Ink.

grown pretty cool, add two pounds of black rosin, and one pound of hard soap cut into thin slices. If the oil is very hot when the soap is added, almost the whole mixture will run over the vessel. The mixture is then to be set again over the fire; and when the ingredients are thoroughly melted, a pound of lamp-black, previously put through a lawn sieve, is to be stirred into it. The whole ought then to be ground on a marble stone, or in a levigating mill.

Though the above receipt is greatly superior to any that hath been hitherto published, all of which are capitally deficient in not mentioning the necessary ingredients of rosin and soap; yet it must be acknowledged, that ink made in this manner is inferior in point of colour, and is likewise more apt to daub the types and make an indistinct impression, than such as is prepared by some of those who make the manufacture of this commodity their employment; so that either a variation in the proportion of the ingredients, a nicety in the mixture, or some additional ingredient, seems necessary to bring it to the requisite perfection.

Ink for the rolling Press, is made of lintseed oil burnt in the same manner as that for common printing ink, and then mixed with Francfort-black, and finely ground. There are no certain proportions which can be determined in this kind of ink; every workman adding oil or black to his ink as he thinks proper, in order to make it suit his own taste.—Some, however, mix a portion of common boiled oil, which has never been burnt: but this must necessarily be a bad practice, as such oil is apt to go through the paper; a fault very common in prints, especially if the paper is not very thick. No soap is added; because the ink is not cleared off from the copperplates with alkaline ley as in common printing, but with a brush dipped in oil.

INK is also an appellation given to any coloured liquor used in writing. Different kinds of these inks may be prepared by the directions given under the article *COLOUR-Making*.

Sympathetic Ink, a liquor with which a person may write, and yet nothing appear on the paper after it is dry, till some means are used, as holding the paper to the fire, rubbing it over with some other liquor, &c.

These kinds of ink may be divided into seven classes, with respect to the means used to make them visible; viz. 1. Such as become visible by passing another liquor over them, or by exposing them to the vapour of that liquor. 2. Those that do not appear so long as they are kept close, but soon become visible on being exposed to the air. 3. Such as appear by strewing or sifting some very fine powder of any colour over them. 4. Those which become visible by being exposed to the fire. 5. Such as become visible by heat, but disappear again by cold or the moisture of the air. 6. Those which become visible by being wetted with water. 7. Such as appear of various colours.

I. The first class contains four kinds of ink, viz. solutions of lead, bismuth, gold, and green vitriol, or sulphate of iron. The first two become visible by the contact of sulphureous liquids or fumes. For the first, a solution of common sugar of lead in water answers very well. With this solution write with a clean pen, and the writing when dry will be totally invisible; but

if it be wetted with a solution of *hepar sulphuris*, or of orpiment, dissolved by means of quicklime; or exposed to the strong vapours of these solutions, the writing will appear of a brown colour, more or less deep according to the strength of the sulphureous fume. By the same means the solution of nitrate of bismuth will appear of a deep black.

The sympathetic ink prepared from gold depends on the property by which that metal precipitates from its solvent on the addition of a solution of tin. Write with a solution of gold in nitro-muriatic acid, and let the paper dry gently in the shade; nothing will appear for the first seven or eight hours. Dip a pencil in the solution of tin, and drawing it lightly over the invisible characters, they will immediately appear, of a purple colour.

Characters written with a solution of green vitriol, will likewise be invisible when the paper is dry; but if wetted with an infusion of galls, they will immediately appear as if written with common ink. If, instead of this infusion, a solution of an alkaline prussiate be used, the writing will appear of a deep blue.

II. To the second class belong the solutions of all those metals which are apt to attract oxygen from the air, such as lead, bismuth, silver, &c. The sympathetic ink of gold already mentioned belongs also to this class; for if the characters written with it are long exposed to the air, they become by degrees of a deep violet colour, nearly approaching to black. In like manner, characters written with a solution of nitrate of silver are invisible when newly dried, but being exposed to the sun, appear of a gray colour like slate. To this class also belong solutions of sugar of lead, nitrates of copper and of mercury, acetate of iron, and muriate of tin. Each of these has a particular colour when exposed to the air; but they corrode the paper.

III. The third class of sympathetic inks contains such liquids as have some kind of glutinous viscosity, and at the same time are long in drying; by which means, though the eye cannot discern the characters written with them upon paper, the powders strewed upon them immediately adhere, and thus make the writing become visible. Of this kind are urine, milk, the juices of some vegetables, weak solutions of the deliquescent salts, &c.

IV. This class, comprehending all those that become visible by being exposed to the fire, is very extensive, as it contains all those colourless liquids in which the matter dissolved is capable of being reduced, or of reducing the paper, into a sort of charcoal by a small heat. Sulphuric acid diluted with as much water as will prevent it from corroding the paper makes a good ink of this kind. Letters written with this fluid are invisible when dry, but instantly on being held near the fire appear as black as if written with the finest ink. Juice of lemons or onions, a solution of sal-ammoniac, green vitriol, &c. answer the same purpose.

V. The fifth class comprehends only a solution of muriate of cobalt; for the properties of which, see CHEMISTRY, N^o 1608, p. 627.

VI. This class comprehends such inks as become visible when characters written with them are wetted with water. They are made of all such substances as deposit a copious sediment when mixed with water, dissolving only imperfectly in that fluid. Of this kind

Ink-stones are dried alum, sugar of lead, vitriol, &c. We have therefore only to write with a strong solution of these salts upon paper, and the characters will be invisible when dry; but when we apply water, the small portion of dried salt cannot again be dissolved in the water. Hence the insoluble part becomes visible on the paper, and shows the characters written in white, gray, brown, or any other colour which the precipitate assumes.

VII. Characters may be made to appear of a fine crimson, purple, or yellow, by writing on paper with solution of muriate of tin, and then passing over it a pencil dipped in a decoction of cochineal, Brazil-wood, log-wood, yellow wood, &c.

Ink Stones, a kind of small round stones, of a white, red, gray, yellow, or black colour, containing a quantity of native martial vitriol, whence they derive the property of making ink, and from thence their name. They are almost entirely soluble in water, and besides their other ingredients, contain also a portion of copper and zinc.

INLAND, a name for any part of a country at a distance from the sea.

INLAND Navigation. See **CANAL** and (*Inland*) **NAVIGATION**.

INLAND Trade, that kind of trade carried on between the different parts of the same kingdom, whether over land, or by means of inland navigation.

INLAYING. See **VENEERING**, **MOAIC**, and **MARQUETRY**.

INLEALED, in our old writers, signifies entangled or enlarded. It is used in the champion's oath.

INLISTING, in a military sense. See **LISTING**.

INMATES, such persons as are admitted for their money, to live in the same house or cottage with another man, in different rooms, but going in at the same door; being usually supposed to be poor, and not able to maintain a whole house themselves. These are inquirable in a court-leet.—No owner or occupier of a cottage shall suffer any inmates therein, or more families than one to inhabit there, on pain of forfeiting 10s. per month to the lord of the leet.

INN, a place appointed for the entertainment and relief of travellers.

Inns are licensed and regulated by justices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a person who keeps a common inn, refuses to receive a traveller into his house as a guest, or to find him victuals and lodging on his tendering a reasonable price for them, he is liable to an action of damages, and may be indicted and fined at the king's suit. The rates of all commodities sold by innkeepers, according to our ancient laws, may be assessed; and innkeepers not selling their hay, oats, beans, &c. and all manner of victuals, at reasonable prices, without taking any thing for litter, may be fined and imprisoned, &c. by 21 Jac. I. c. 21. Where an innkeeper harbours thieves, persons of infamous character, or suffers any disorders in his house, or sets up a new inn where there is no need of one, to the hindrance of ancient and well governed inns, he is indictable and fineable: and by statute, such inn may be suppressed. Action upon the case lies against any innkeeper, if a theft be committed on his guest by a servant of the inn, or any other person not be-

longing to the guest; though it is otherwise where the guest is not a traveller, but one of the same town or village, for there the innkeeper is not chargeable; nor is the master of a private tavern answerable for a robbery committed on his guest: it is said, that even though the travelling guest does not deliver his goods, &c. into the innkeeper's possession, yet if they are stolen, he is chargeable. An innkeeper is not answerable for any thing out of his inn, but only for such as are within it; yet, where he of his own accord puts the guest's horse to graze, and the horse is stolen, he is answerable, he not having the guest's orders for putting such horse to graze. The innkeeper may justify the stopping of the horse, or other thing of his guest, for his reckoning, and may retain the same till it be paid. Where a person brings his horse to an inn, and leaves him in the stable, the innkeeper may detain him till such time as the owner pays for his keeping: and if the horse eats out as much as he is worth, after a reasonable appraisement made, he may sell the horse and pay himself: but when a guest brings several horses to an inn, and afterwards takes them all away except one, this horse so left may not be sold for payment of the debt for the others; for every horse is to be sold, only to make satisfaction for what is due for his own meat.

INNS. Our colleges of municipal or common law professors and students, are called *inns*: the old English word for houses of noblemen, bishops, and others of extraordinary note, being of the same signification with the French word *hôtels*.

Inns of Court are so called, as some think, because the students there are to serve and attend the courts of judicature; or else, because anciently these colleges received none but the sons of noblemen, and better sort of gentlemen, who were here to be qualified to serve the king in his court; as Fortescue affirms. And, in his time, he says, there were about 2000 students in the inns of court and chancery, all of whom were *fili nobilitum*, or gentlemen born. But this custom has gradually fallen into disuse; so that in the reign of Queen Elizabeth, Sir Edward Coke does not reckon above 1000 students, and the number at present is very considerably less; for which Judge Blackstone assigns the following reasons. 1. Because the inns of chancery, being now almost totally filled by the inferior branches of the profession, are neither commodious nor proper for the resort of gentlemen of any rank or figure; so that there are very rarely any young students entered at the inns of chancery. 2. Because in the inns of court all sorts of regimen and academical superintendance, either with regard to morals or studies, are found impracticable, and therefore entirely neglected. Lastly, because persons of birth and fortune, after having finished their usual courses at the universities, have seldom leisure or resolution sufficient to enter upon a new scheme of study at a new place of instruction; wherefore few gentlemen now resort to the inns of court, but such for whom the knowledge of practice is absolutely necessary in such as are intended for the profession.

Our inns of court, justly famed for the production of men of learning in the law, are governed by masters, principals, benchers, stewards, and other officers; and have public halls for exercises, readings, &c.

Inns
||
Innisfallen.

which the students are obliged to attend and perform for a certain number of years, before they can be admitted to plead at the bar. These societies have not, however, any judicial authority over their members; but instead of this they have certain orders among themselves, which have by consent the force of laws. For lighter offences persons are only excommunicated, or put out of commons; for greater, they lose their chambers, and are expelled the college; and when once expelled out of one society, they are never received by any of the others. The gentlemen in these societies may be divided into benchers, outer-barristers, inner-barristers, and students.

The four principal inns of court, are the Inner Temple and Middle Temple, heretofore the dwelling of the Knights Templars, purchased by some professors of the common law about 300 years ago; Lincoln's Inn and Gray's Inn, anciently belonging to the earls of Lincoln and Gray. The other inns are the two Serjeants Inns.

Inns of Chancery were probably so called, because anciently inhabited by such clerks as chiefly studied the forming of writs, which regularly belonged to the curfitors, who are officers of chancery.

The first of these is Thavies Inn, begun in the reign of Edward III. and since purchased by the society of Lincoln's Inn. Beside this, we have New Inn, Symond's Inn, Clement's Inn, Clifford's Inn, anciently the house of the Lord Clifford; Staple Inn, belonging to the merchants of the staple; Lion's Inn, anciently a common inn with the sign of the lion; Furnival's Inn, and Bernard's Inn.

These were heretofore preparatory colleges for younger students; and many were entered here, before they were admitted into the inns of court. Now they are mostly taken up by attorneys, solicitors, &c.

They all belong to some of the inns of court, who formerly used to fend yearly some of their barristers to read to them.

INNATE IDEAS, those supposed to be stamped on the mind, from the first moment of its existence, and which it constantly brings into the world with it: a doctrine which Mr Locke has taken great pains to refute.

INNERKEITHING. See INVERKEITHING.

INNERLOCHY. See INVERLOCHY and FORT-WILLIAM.

INNIS. See INCH.

INNISCLOCHRAN, or the STONEY ISLAND, an island in Lough Ree, in the river Shannon, between the counties of Westmeath and Roscommon, at which place a monastery was founded by St Dermond, about the beginning of the 6th century.

INNISFAIL (derived from *Inis Bheal*, that is, "the island of Bheal"), one of the ancient names of Ireland, so denominated from *Beal*, the principal object of adoration among the ancient inhabitants of the British isles. Innisfail has been erroneously translated the *Island of Destiny*, as *Bheal* was sometimes taken for *Fate* or *Providence*.

INNISFALLEN, an island in the lake of Killarney, in the county of Kerry and province of Munster: in it are the ruins of a very ancient religious house, founded by St Finian, the patron saint of these parts, and to him the cathedral of Aghadoc is also dedicated.

The remains of this abbey are very extensive, its situation romantic and retired. Upon the dissolution of religious houses, the possessions of this abbey were granted to Captain Robert Collam. The island contains about 12 acres, is agreeably wooded, and has a number of fruit-trees. St Finian flourished about the middle of the 6th century; he was furnished in Irish *Lobhar*, his father's name was *Conail* the son of *Eschod*; descended from *Kian* the son of *Alild*, king of Munster. There was formerly a chronicle kept in this abbey, which is frequently cited by Sir J. Ware and other antiquaries under the title of the *Annals of Innisfallen*. They contain a sketch of universal history, from the creation of the world to the year 430 or thereabouts, but from thence the annalist has amply enough prosecuted the affairs of Ireland down to his own times. He lived to the year 1215. Sir J. Ware had a copy of them, whereof there is an imperfect transcript among the MSS. of the library of Trinity-college, Dublin. They were continued by another hand to the year 1320. Bishop Nichollon, in his Irish historical library, informs us, that the duke of Chandos had a complete copy of them down to 1320 in his possession. These annals tell us, that in the year 1180, the abbey, which had at that time all the gold and silver and richest goods of the whole country deposited in it, as the place of greatest security, was plundered by Mildwin son of Daniel O'Donoghoe, as was also the church of Ardferit, and many persons were slain in the very cemetery by the M'Cartys; but God, as it is said in this chronicle, punished this impiety by the untimely end of some of the authors of it.

INNISHANNON, a town in the county of Cork and province of Munster, 134 miles from Dublin; situated on the river Bandon, and six miles from Kinsale. The river is navigable to Collier's quay, about half a mile below the place. On the west side of the town is a strong bridge. This place was formerly walled, and of some note, as appears by the foundations of several castles and large buildings discovered in it. The town of Innishannon, together with its ferry, were granted to Philip de Barry by Henry V. by letters patent, anno 1412.

INNISHIRKAN, an island situated between Cape Clear island and Baltimore bay, in the county of Cork and province of Munster. In this island stood the castle of Dunelong, possessed by the O'Driscolls, which was surrendered after the defeat of the Spaniards to Captain Hervey on 23d Feb. 1602. There was afterwards a regular fortification erected on part of the island, which was garrisoned in Queen Anne's time, but it has been for several years dismantled; about a mile to the south are the remains of an ancient abbey, founded 1460, for Franciscans, by Florence O'Driscoll. This island has very good land, and is vastly preferable to that of Cape Clear island. To the north-west of Innishirkan island lies Hare island, a large fruitful spot; and near it are four small islands called the *Schemes*: also along the coast, in the following order from east to west, are Horse island, containing 100 acres; Castle island, containing 119 acres; Long island, containing 316 acres; and west of all these is a small spot called Goat island. All these islands, together with the adjacent coast, produce large crops of fine English barley.

INNISKILLING

inniskilling
||
inoculation.

INNISKILLING, a borough town of Ireland, in the county of Fermanagh and province of Ulster, lying between three lakes. It is about 24 miles east of Ballyshannon, and 79 north-west of Dublin, this place giving title of viscount to the family of Cole. Its inhabitants distinguished themselves in several considerable engagements in the wars of Ireland at the revolution, out of which a regiment of dragoons, bearing the title of the *Inniskilleners*, was mostly formed. They form the 6th regiment of dragoons in the British army.

INNOCENT'S DAY, a festival of the Christian church, observed on December 28. in memory of the massacre of the innocent children by the command of Herod king of Judæa. See *Jesus Christ*; and **JEW**, N^o 24 par. ult. The Greek church in their calendar, and the Abyssinians of Ethiopia in their offices, commemorate 14,000 infants on this occasion.

INNUENDO (of *innuo*, "I nod or beckon"), is a word frequently used in writs, declarations, and pleadings, to ascertain a person or thing which was named, but left doubtful, before: as, he (*innuendo* the plaintiff) did so and so: mention being before made of another person.—In common conversation or writing, an *innuendo* denotes an oblique hint or distant reference, in contradistinction to a direct and positive charge.

INO, in fabulous history, a daughter of Cadmus and Harmonia, who nursed Bacchus. She married Athamas king of Thebes, after he had divorced Nephele, by whom he had two children Phryxus and Helle. Ino became mother of Melicerta and Learchus; and soon conceived an implacable hatred against the children of Nephele, because they were to ascend the throne in preference to her own. Phryxus and Helle were informed of Ino's machinations, and they escaped to Colchis on a golden ram. Juno, jealous of Ino's prosperity, resolved to disturb her peace; and more particularly because she was of the descendants of her greatest enemy, Venus. Tiphone was sent by order of Juno to the house of Athamas; and she filled the whole palace with such fury, that Athamas taking Ino to be a lioness and her children whelps, pursued her and dashed her son Learchus against a wall. Ino escaped from the fury of her husband; and from a high rock she threw herself into the sea with Melicerta in her arms. The gods pitied her fate, and Neptune made her a sea deity, which was afterwards called Leucothoe. Melicerta became also a sea god, known by the name of Palemon.

INO, festivals in memory of Ino, celebrated yearly with sports and sacrifices at Corinth. An anniversary sacrifice was also offered to Ino at Megara, where she was first worshipped under the name of Leucothoe.—Another in Laconia, in honour of the same. It was used at the celebration to throw cakes of flour into a pond, which if they sunk were prefaces of prosperity, but if they swam on the surface of the waters they were inauspicious and very unlucky.

INOCARPUS, a genus of plants belonging to the decandria class. See **BOTANY Index**.

INOCULATION, or **BUDDING**, in *Gardening*, is commonly practised upon all sorts of stone fruit; as nectarines, peaches, apricots, plums, cherries, as also upon oranges and jasmynes: and indeed this is preferable to any sort of grafting for most sorts of fruit. For the method of performing it, see **GARDENING Index**.

INOCULATION, in a physical sense, is used for the transplantation of dimpers from one subject to another, particularly for the engraftment of the smallpox; which, though of ancient use in the eastern countries, is but a modern practice among us, at least under the direction of art.

Inoculation.

It is well observed by the baron Dimsdale, that accident hath furnished the art of medicine with many valuable hints, and some of its greatest improvements have been received from the hands of ignorance and barbarism. This truth is remarkably exemplified in the practice of inoculation of the smallpox: but to the honour of the British physicians, they measured not the value of this practice by the meanness of its origin, but by its real importance and utility; they patronised a barbarous discovery with no less zeal and affection than if it had been their own. Indeed the whole nation might be said to have adopted the practice; for the greatest encouraged it by becoming examples, and the wisest were determined by the general event of the method.

The time and place in which the art of inoculating for the smallpox was first formed, are equally unknown. Accident probably gave rise to it. Pylarini says, that among the Turks it was not attended to except amongst the meaner sort. Dr Russel informs us in the *Philosophical Transactions*, vol. lviii. p. 142. that no mention is made of it by any of the ancient Arabian medical writers that are known in Europe; and the physicians who are natives in and about Arabia assert, that nothing is to be found regarding it in any of those of a more modern date. He farther says, that he engaged some of his learned Turkish friends to make inquiry; but they did not discover any thing on this subject of inoculation either in the writings of physicians, historians, or poets. Until the beginning of the 18th century, all the accounts we have of inoculating the smallpox are merely traditional. The silence on this subject, observed amongst writers in the countries where the practice obtained, Dr Russel supposes, with great probability, to be owing to the physicians there never countenancing or engaging in it. It is also remarkable, that before Pylarini's letter to the Royal Society in 1701, nor yet for several years after, this practice is not noticed by any of the most inquisitive travellers. On this Dr Russel very justly observes, that customs, the most common in distant countries, are often the least apt to attract the observation of travellers, who, engaged in other pursuits, must be indebted to accident for the knowledge of such things as the natives seldom talk of, upon the belief that they are known to all the world.

The first accounts we have in the learned world concerning inoculation, are from two Italian physicians, viz. Pylarini and Timoni, whose letters on the subject may be seen in the *Phil. Transf. abridged*, vol. v. p. 370, &c. The first is dated A. D. 1701; the next is dated A. D. 1713. Whether our inquiries are extended abroad or confined to our own country, inoculation hath been practised under one mode or other time immemorial; in Great Britain and its adjacent isles we have well authenticated accounts, extending farther backward than any from the continent. Dr Williams of Haverfordwest, who wrote upon inoculation in 1725, proves, that it had been practised in Wales, though in a form somewhat different, time out of mind. Mr Wright, a

Inocula-
tion.

surgeon in the same place, says, that buying the smallpox is but a common practice, and of long standing in that neighbourhood. He says, that in Pembrokehire there are two large villages near the harbour of Milford, more famous for this custom than any other, viz. St Ishmael's and Marloes. The old inhabitants of these villages say, that it hath been a common practice; and that one William Allen of St Ishmael's, who in 1722 was 90 years of age, declared to some persons of good sense and integrity, that this practice was used all his time; that he well remembered his mother telling him, that it was a common practice all her time, and that he got the smallpox that way; so that at least we go back 160 years or more.

In the Highlands of Scotland and some of the adjacent isles, Dr Alexander Monro senior informs us, that the custom through ages past hath been, to put their children to bed with those who laboured under a favourable smallpox, and to tie worsted threads about their children's wrists, after having drawn them through variolous pustules.

According to the result of Dr Russel's inquiries, the Arabians assert, that the inoculation of the smallpox has been the common custom of their ancestors, and that they have no doubt of its being as ancient as the disease itself. It is remarkable, that buying the smallpox is the name universally applied in all countries to the method of procuring the disease: it is true that there are other terms; but in Wales and Arabia, as well as many other countries, this is the usual appellation. From the sameness of the name, and the little diversity observable in the manner of performing the operation, it is probable that the practice of inoculation in these countries is originally derived from the same source. From its extensive spread, it is probably of great antiquity too.

In the year 1717, Lady Mary Wortley Montague, wife of the English ambassador at Constantinople, had her son inoculated there at the age of six years; he had but few pustules, and soon recovered. In April 1721, inoculation was successfully tried on seven condemned criminals in London, by permission of his majesty. In 1722, Lady Mary Wortley Montague had a daughter of six years old inoculated in this island; soon after which, the children of the royal family that had not had the smallpox were inoculated with success; then followed some of the nobility, and the practice soon prevailed. And here we date the commencement of inoculation under the direction of art.

From the example of the royal family in England, the practice was adopted in Germany, particularly in Hanover, and its adjacent countries.

After Mr Maitland had succeeded with those he had inoculated in and about London, he introduced the practice into Scotland in the year 1726.

Sweden soon followed the example of the British. Russia lately engaged one of our principal promoters and improvers of this art. And now there are not many countries that do not more or less practice it.

Different Modes of INOCULATION. The practice of inoculation having obtained in every part of the world, it may be grateful, at least to curiosity, to have a general account of the different modes that are and have been adopted in that practice.

Inoculation with the blood of variolous patients hath

been tried without effect; the variolous matter only produces the variolous disease.

The application of the variolous matter takes place in a sensible part only; the activity of the virus is such, that the smallest atom, though imperceptible to any of our senses, conveys the disease as well as the largest quantity. Hence the most obvious method is the prick of a needle or the point of a lancet dipped in the matter of a variolous pustule.

Cotton or thread is used, that is previously rubbed with powdered variolous scabs; this thread is drawn with a needle through the cutis, but not left in. This is the method in some parts of the East Indies. The Indians pass the thread on the outside of the hand, between any of the fingers, or between the fore finger and thumb. The Thesalian women inoculate in the forehead and chin.

Some abrade the scarf-skin, and rub in the powdered dry scabs which fall from the pustules of patients with the smallpox.

Many of the Greek women make an oblique puncture with a needle, on the middle of the top of the forehead, on each cheek, the chin, each metacarpus, and each metatarsus; then drop in each a little of the pus just taken warm from a patient, and brought in a servant's bosom. Others in Greece make several little wounds with a needle in one, two, or more places, in the skin, till some drops of blood ensue; then the operator pours a drop of warm pus fresh from a pustule, and mixes it with the blood as it issues out; then the wound is covered by some with a bandage, by others with half a walnut shell placed with its concave side over each orifice.

The Chinese convey a pellet of variolated cotton, with the addition of a little musk, into the nostrils of the patient; they collect dry pustules, and keep them in a porcelain bottle well corked; and when they inoculate, they mix a grain of musk with three or four grains of the dry scales, and roll them in cotton. This method may be called *inodoration*.

About Bengal, in the East Indies, the person who intends to be inoculated, having found a house where there is a good sort of the smallpox, goes to the bed of the sick person, if he is old enough; or if a child, to one of his relations, and speaks to him as follows: "I am come to buy the smallpox." The answer is, "Buy if you please." A sum of money is accordingly given, and one, three, or four pustules, for the number must always be odd, and not exceeding five, extracted whole, and full of matter. These are immediately rubbed on the skin of the outside of the hand between the forefinger and the thumb; and this suffices to produce the disease. The same custom obtains in Algiers, Tunis, Tripoli, and other countries.

Very similar to the custom among the people about Bengal, &c. is that in Arabia, where on some fleshy part they make several punctures with a needle imbued in variolous matter, taken from a pustule of a favourable kind. Here they buy the smallpox too, as follows: the child to be inoculated carries a few raisins, dates, sugar-plums, or such like; and showing them to the child from whom the matter is to be taken, asks how many pocks he will give in exchange? The bargain being made, they proceed to the operation; but this buying, though still continued, is not thought necessary

Inocula-
tion.

necessary to the success of the operation. The Arabs say that any fleshy part is proper; but generally they insert the matter between the fore-finger and thumb on the outside of the hand.

The Georgians insert the matter on the fore-arm.

The Armenians introduce the matter on the two thighs. In Wales the practice may be termed infraction of the smallpox. There some of the dry pustules are procured by purchase, and are rubbed hard upon the naked arm or leg.

The practice in some places is to prick the skin between some of the fingers by means of two small needles joined to one another; and after having rubbed a little of the matter on the spot, a circle is made by means of several punctures of the bigness of a common pustule, and matter is again rubbed over it. The operation is finished by dressing the wound with lint.—Another custom is to mix a little of the variolous matter with sugar, and give it to be drank in any agreeable liquor.

Incisions have been made in the arms and legs, and thread, cotton, or lint, previously dipped in the variolous matter, was lodged in them. The practice of some is to bathe the feet in warm water, and then secure lint dipped in the variolous matter on the instep, or other part of the foot, where the skin is thin. Others apply a small blistering plaster; and when the scarf skin is elevated and slipped off, the variolous matter is applied to the surface of the true skin, and confined there by a little lint or plaster. Scratching the skin with a pin or needle, and then rubbing the part with lint, previously dipped in variolous matter, is the custom in some places.

In the Highlands of Scotland they rub some part of the skin with fresh matter, or dip worsted in variolous matter, and tie it about the children's wrists. They observe, that if fresh matter is applied a few days successively, the infection is more certain than by one application.

Having thus given the history of inoculation for the smallpox, which not many years ago was justly regarded as one of the greatest discoveries which had been made for the benefit of mankind, and would still be regarded as such had it not given place to one still more valuable and important, the *vaccine inoculation* or *cowpox*, which now promises to banish the smallpox from the world. For an account of this, see VACCINATION. It would be quite unnecessary to enter into the detail of the advantages to be derived from inoculation for the smallpox, and the methods of performing or preparing for it formerly practised. But, as a curious part of the history of this practice, we shall just barely mention some of the objections which have been urged against it.

It has been said that inoculation for the smallpox is unlawful; that it is bringing a distemper on ourselves, and thus usurping the sacred prerogative of God; that the decrees of God have fixed the commission of every disease, and our precautions cannot prevent what he hath determined; that we should not do evil that good may come; that the patient may die, and then his last moments are distressed, and the future reflections of his friends are grievous; that fear is a dangerous passion in the smallpox, but inoculation increases the causes of fear, by lessening our faith and trust in God; that ino-

culatation does not exempt from future infection; that other diseases are communicated with the matter of the smallpox by inoculating it; that perhaps the disease may never attack in the natural way; that it requires much thought to know what we should do with regard to inoculation; that it endangers others, and that the practice of inoculation comes from the devil.

INORDINATE PROPORTION. See PROPORTION, *Inordinate*.

INOSCULATION, in *Anatomy*, the same with ANASTOMOSIS.

INPROMPTU, or IMPROMPTU. See IMPROMPTU.

INQUEST, in *Scots Law*, the same with JURY.

INQUISITION, in the church of Rome, a tribunal in several Roman Catholic countries, erected by the popes for the examination and punishment of heretics.

This court was founded in the 12th century by Father Dominic and his followers, who were sent by Pope Innocent III. with orders to excite the Catholic princes and people to extirpate heretics, to search into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called *inquisitors*; and this gave birth to the formidable tribunal of the inquisition, which was received in all Italy and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of heresy, Judaism, Mahometanism, sodomy, and polygamy; and the people stand in so much fear of it, that parents deliver up their children, husbands their wives, and masters their servants, to its officers, without daring in the least to murmur. The prisoners are kept for a long time, till they themselves turn their own accusers, and declare the cause of their imprisonment; for they are neither told their crime nor confronted with witnesses. As soon as they are imprisoned, their friends go into mourning, and speak of them as dead, not daring to solicit their pardon, lest they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The sentence against the prisoners is pronounced publicly, and with extraordinary solemnity. In Portugal, they erect a theatre capable of holding 3000 persons; in which they place a rich altar, and raise seats on each side in the form of an amphitheatre. There the prisoners are placed; and over against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquisitors.

These unhappy people know what they are to suffer by the clothes they wear that day. Those who appear in their own clothes are discharged upon payment of a fine; those who have a *santo benito*, or *strait yellow coat* without sleeves, charged with St Andrew's cross, have their lives, but forfeit all their effects: those who have the resemblance of flames made of red serge, sewed upon their *santo benito*, without any cross, are pardoned, but threatened to be burnt if ever they relapse: but those who, besides these flames, have on their *santo benito* their own picture, surrounded with figures of devils, are condemned to expire in the flames. The inquisitors, who are ecclesiastics, do not pronounce the sentence of death; but

Insects.

but form and read an act, in which they say, that the criminal being convicted of such a crime, by his own confession, is with much reluctance delivered to the secular power to be punished according to his demerits: and this writing they give to the seven judges who attend at the right side of the altar, who immediately pass sentence. For the conclusion of this horrid scene, see *Act of Faith*.

INSCRIBED, in *Geometry*. A figure is said to be inscribed in another, when all its angles touch the side or planes of the other figure.

INSCRIPTION, a title or writing affixed to any thing, to give some farther knowledge of it, or to transmit some important truth to posterity.

Antiquaries are very curious in examining ancient inscriptions found on stones and other monuments of antiquity. Sanhoniathon, contemporary, as it is said, with Gideon, drew most of the memoirs whereof his history is composed from inscriptions which he found in temples and on columns, both among the Heathens and the Hebrews.

It appears, indeed, that the ancients engraved upon pillars the principles of sciences, as well as the history of the world. Those mentioned by Herodotus show, that this was the first way of instructing people, and of transmitting histories and sciences to posterity. This is confirmed by Plato in his *Hippias*; wherein he says, that Pisistratus engraved on stone-pillars precepts useful for husbandmen. Pliny assures us, that the first public monuments were made of plates of lead; and that the treaties of confederacy concluded between the Romans and the Jews were written upon plates of brass; that (says he) the Jews might have something to put them in mind of the peace and confederacy concluded with the Romans. The Greeks and Romans were great dealers in inscriptions, and were extremely fond of being mentioned in them: and hence it is, that we find so many in those countries of ancient learning, that large volumes have been composed, as the collection of Gruter, &c. Since Gruter's collection, Th. Reinesius has compiled another huge volume of inscriptions. M. Fabret published another volume at Rome in 1669, wherein he has corrected abundance of errors which had escaped Gruter, Reinesius, and other antiquaries, &c. and added a great number of inscriptions omitted by them.—Since all these, Grævius has published a complete collection of inscriptions, in three vols. folio.

INSCRUTABLE, **UNSEARCHABLE**, in *Theology*, is usually understood of the secrets of Providence, and the judgments of God, which cannot be found out, or into which human reason cannot penetrate.

Academy of INSCRIPTIONS. See **ACADEMY**.

INSECTS, **INSECTA**, in *Natural History*, a smaller sort of animals, commonly supposed to be exsanguinous; and distinguished by certain incisures, cuttings, or indentings in their bodies. The word is originally Latin, formed of *in*, and *seco* "I cut;" the reason of which is, that in some of this tribe, as ants, the body seems to be cut or divided into two; or because the bodies of many, as worms, caterpillars, &c. are composed of different circles, or rings, which are a sort of incisure. See **ENTOMOLOGY**.

Noxious INSECTS; Means of destroying them, or preventing their Increase. The following remedies we

find collected in the Gentleman's Magazine for October 1790.—Of those substances which have been generally observed to be efficacious in driving away or in destroying insects, mercury, and its various preparations, may be reckoned one of the most generally useful. Sulphur is also useful. Oils of all kinds have been often and deservedly recommended. Tobacco is not less remarkable for its utility. Of the application of these in order.

1. Mercury is known to kill or drive away lice from the human body; and it may probably be of equal efficacy in ridding other animals of their insects. For instance, sheep having a small quantity of mercurial ointment rubbed on their skins, on the sides, between the fore-legs and the body, it may kill or drive away the insect peculiar to them. Sulphur is recommended to be added to the mercurial ointment. Thus not only the insect peculiar to them, but also the scab, may be cured: See the Transactions of the Society for the Encouragement of Arts, London, vol. vii. viii. p. 90. In the Transactions of the same society, vol. v. vi. p. 59. Mr Ailway directed that, in the winter, the walls, frames, &c. of his green and hot-houses should be well washed with the following mixture: Take of corrosive sublimate mercury four ounces, and dissolve it in two gallons of water. These houses had been greatly infested with red spiders and ants. After having been washed with the above mixture, neither were to be seen next summer. This wash may be used on old garden-walls, and to the roots of fruit-trees infested with insects, if made weaker. It may destroy the tender leaves of plants, though not the roots. This wash will effectually destroy that disagreeable insect the bug, and all other insects of a tender cuticle; and it will not in the least hurt the colour of bed-furniture or hangings. Care must be taken, that the wash be applied into every crevice or folding of the furniture with a painter's brush. It will sometimes be necessary to repeat the wash, as some of the ova of bugs may remain concealed, notwithstanding the utmost care.

Some of the West India islands were much infested with large ants, which greatly hurt the sugar-canes. The remedy was, to dissolve corrosive sublimate mercury in rum, in the proportion of two drams to a pint of spirits. This solution was poured on dry powdered sugar; and when the sugar was dried, it was laid in the paths of the ants. They ate it, and were destroyed. Might not this practice be imitated, by laying sugar thus prepared on paper or pieces of thin boards near the roots of fruit-trees infested by insects, especially when the fruit is ripening? The papers or boards might be taken in during the night, or when it rained. The sugar should be coloured with indigo, or other substance, thereby to mark it as a substance to be avoided by curious idlers.

2. We are informed that a person in Philadelphia employed brimstone in the following manner. Having cleared all round the roots of trees infested with caterpillars or other insects, he strewed some flour of brimstone round the roots, and covered it with a thin sprinkling of fine mould, that it might not be blown away by the wind, yet so that the sun might operate through, and cause the brimstone to fumigate. Thus he destroyed the caterpillars. One pound he found sufficient for 200 trees. In that hot climate the sun

Insects. may perhaps have that effect; but it scarcely will in this. He also employed sulphur in the following manner to drive insects from tall trees. He split the end of a pole, and put in the slit some matches, set them on fire, and held them under the parts of the trees chiefly affected. A pole thus armed, he found, would answer for three or four trees. Brimstone thus mixed with damp straw, and set on fire, for instance, in hop-ground infested with the fly, might be of use to drive away the fly.

The itch is supposed to proceed from a very small insect which nestles under the skin, and proceeds no farther into the habit; and is therefore attended with no dangerous consequences. Brimstone made into an ointment with hogs-lard is a sure remedy.

Sheep are liable to an eruption on the skin, known by the name of the *scab*. The brimstone, when added to the mercurial ointment recommended for that disorder in the Transactions of the Society for the Encouragement of Arts, vol. vii. p. 90. might perhaps render the application more efficacious and less dangerous.

3. The natives of hot countries are taught by experience, that an unctuous covering on their bodies prevents the bites of musquitoes and all gnats. The white inhabitants in such countries are not sufficiently careful in preventing the least stagnant water near their dwellings, in which the musquitoes are bred; even in the walle water thrown out they are produced. Dr Franklin, by a careful attention to this circumstance, guarded his family in Philadelphia from such insects: one day seeing a number of musquitoes in his library, he found on inquiry, that one of his servants had taken the cover off a tub placed near his window for receiving rain-water. On such an occasion the remedy is easy, viz. shutting the room up for the day, so that the musquitoes cannot come at any water, in which time they die. Though this caution may seem trifling to us who live in a mild climate, it is far otherwise in hot countries.

Oil being known to be most efficacious in destroying insects, may not the use of it be extended to the destruction of worms in the bowels of horses, where they may occasion the violent pain they seem sometimes to suffer? If the horse was for some time kept fasting, and a large quantity of oil, suppose a pint, was given, if worms are the cause, the oil may in that case kill them.

Flowers, leaves, and fruit, on plants, are known to be devoured by caterpillars. These are destroyed by oils, which close the lateral pores by which they breathe. For this purpose it is advised, that, on the approach of spring, a cloth dipped in train oil be laid on such parts of the tree in which there is the least appearance of them.

We are informed in the Memoirs of the Society of Agriculture at Paris, that oil of turpentine, when applied to animals which were covered with insects, destroyed the insects without hurting the animal. The author tried it on several trees, mixed with fine earth so as to incorporate them well, then adding water, still stirring them carefully till the whole was brought to some degree of fluidity. In this mixture he dipped branches of fruit trees on which there were insects, and hereby destroyed not only the eggs but also the insects, without hurting the leaves. This composition may be

got off by washing, or the first heavy shower. From these experiments the author thinks, that oil of turpentine may with equal efficacy be employed for killing various kinds of lice on domestic animals. *Insects.*

We are informed, in the Transactions of the Society for the Encouragement of Arts, vol. v. p. 45, that Mr Winter, among other experiments on turnip-seed, steeped the seed 24 hours in a sufficient quantity of train oil. He then drained the oil from the seed, which he mixed with a quantity of fine sifted earth, and immediately sowed it in drills. When the plants began to appear on the surface, the ground was sown with foot. He found that seed steeped in lintseed oil answered equally well. The turnips the least injured by the fly were those that grew from seed steeped as above, which grew so luxuriantly as to produce rough leaves several days prior to the most flourishing of any of his other experiments, and were the better enabled to withstand the fly's attack. The leaves of these turnips were of a darker green, and appeared twice as thick in bulk and luxuriance than the other turnips, and were a considerable deal larger. The seed was drilled an inch and a half deep, and at a foot distance in the rows. Train oil is apt to kill the leaves of plants which have been injured by insects, but lintseed oil has not that effect, though equally destructive to the insects. The train oil seems to act both as an oil, and by its disagreeable smell it prevents insects approaching it. In this respect it may be successfully used to prevent field mice or other vermin preying on acorns, chestnuts, or other seeds steeped in it before they are sown.

When thus giving directions for preventing the fly on turnips, a late experiment should be mentioned, by the disclosing of which a person gained a considerable reward. His secret was, running a roller over the ground early in the morning, while the dew remained on the ground, on the first appearance of the fly. The dew entangled the flies so much, that they could not make their escape, and were therefore crushed to death. As the roller may leave the surface of the earth too hard, some very properly advise to fix some boughs of elder in a gate or hurdle, to be drawn over the field; and if the boughs had been before fumigated with the smoke of tobacco, or tincture of asafœtida, the success would be the surer. The most certain method of preventing the hurt done by the fly is to raise the plants in a nursery, and at a proper age to transplant them, being carried to the ground in a wheel-barrow filled with manure softened with water so as to admit the plants. This method will secure their more speedy growth. In the nursery the attack of the fly may be prevented by sprinkling foot or quicklime on the ground. The utility of transplanting turnips is evident by the practice of transplanting the turnip-rooted cabbage. They who are discouraged from this practice by the expence attending it, do not reflect that the hoeing is prevented, and the plants grow the better, being set in fresh earth.

3. Before proceeding to direct the use of the last means mentioned, viz. tobacco, for destroying insects in turnips, it may be proper to mention an experiment made by Mr Green, of her majesty's flower-garden at Kew. He contrived a pair of bellows, similar to that employed in recovering people seemingly drowned. It has

Insects. has a cavity in the nozzle, in which some tobacco is put, with a live coal over it. The bellows being then worked, the tobacco is set on fire, and the smoke is directed to any particular spot. A lady was fond of having the mofkrose in her dressing-room, but was prevented having it on account of the green insects which constantly adhere to that plant. To remedy this inconvenience, Mr Green had a box made large enough to contain a pot in which a plant of the mofkrose grew. In one end of the box was a hole, to admit the nozzle of the bellows; the bellows was worked, and the smoke was received into the box. When the tobacco was consumed, the nozzle was withdrawn, and a cork being put into the hole, the box thus remained till morning, when the insects were all laid dead on the earth. Being swept off, the plant was in a state fit for a dressing-room. Many plants thus infested with insects may be too large, or otherwise so placed as not to be put into a box. In this case it occurred to the writer of these observations, that being sprinkled with an infusion of tobacco in water might in some degree answer the same purpose. On trial he found it answer, and he thus freed other plants of their insects. He also used it on trees of easy access with advantage. Train oil is so inimical to tender plants or leaves, that it destroys them if insects have in the least hurt them; whereas the infusion, instead of killing the leaves, promoted a fresh vegetation.

Fruit trees often become the prey of insects. Those against a wall, or in espaliers, being easily come at, much of the mischief may be prevented by cutting off the leaves so soon as they are observed to be curled; for then fresh eggs are laid on them, probably by butterflies. If sprinkled with the infusion of tobacco, it will prevent their coming to life. After the fruit is formed, the infusion must not be used, lest the taste and smell may remain. The scissars are then the proper remedies, which ladies may employ as amusement, and may thereby present fruit to their friends of their own preserving. A lye of the ash of plants sprinkled on the leaves may have a good effect, as also on other pot-herbs, which are often the prey of caterpillars. As many insects, besides those bred on the leaves or in the walls, may destroy the fruit, the sugar with the corrosive sublimate, as already described, may be laid in the way of other insects, to all which it will prove a speedy death. Diligent inspection into their retreats is the most certain means of preventing the loss sustained by snails. Ants are prevented rising up the trees, by laying round the roots powdered chalk, or any other substance which by entangling their feet prevents their crossing it. Care should be taken to destroy their nests everywhere near the garden.

Hops are now become an article of so great consequence, that it deserves our particular attention. Early in its growth, when the vines begin to ascend the poles, a black fly preys on its leaves, frequently in such numbers as, by destroying the leaves, to interrupt the vegetation, much of the food of plants being absorbed by the leaves. The infusion of tobacco destroys them, or at least drives them away so effectually, that a plant almost totally stripped of its leaves has put out fresh leaves after the use of it. If care be not taken, they will again fall on the fresh leaves. As the flies lodge on the lower side of the leaves, they are protected from

storms of rain, and therefore the infusion must be driven upwards by a forcing pump. As it is said that the expence of tobacco is too great, perhaps lime-water, or even water by itself, driven strongly against the leaves, might drive them away. The labour attending such experiments in a large plantation discourages others, without reflecting, that, if such means are used early, the flies may more easily be got rid of. Free ventilation is undoubtedly beneficial to all plants; and hence perhaps the particular advantages of drilling corn in rows a little distant. If alleys somewhat larger than common were made in the plantations of hops, there might be sufficient spaces left where the alleys cross one another to admit of setting damp straw, or other materials mixed with brimstone, foot, &c. on fire. Smoke itself is said to prevent the fly; and if so, it will still act more powerfully when mixed with such materials. It has been observed in Sweden, that the hops grow naturally among heaps of stones or fragments of rocks. They therefore advise to cover the ground round their roots with stones, which will prevent the insects laying their eggs near the roots in the ground, where they lay them to be protected during the winter. The stones will also preserve moisture at the roots during the summer. A rope cannot be drawn across a plantation of hops, as it can across a field of corn, in case of mildew. Here water to wash off the clammy juice that entices and feeds insects seems to be the only remedy. The plantation being well ventilated, may at least prevent the frequency of it. The forcing pump will most effectually wash off this exudation.

Cruelty to INSECTS. It does not appear upon what principle of reason and justice it is, that mankind have founded their right over the lives of every creature that is placed in a subordinate rank of being to themselves. Whatever claim they may have in right of food and self-defence (to which ought we to add the purposes of the naturalist, explained above?) did they extend their privilege no farther than those articles would reasonably carry them, numberless beings might enjoy their lives in peace, who are now hurried out of them by the most wanton and unnecessary cruelties. It is surely difficult to discover why it should be thought less inhuman to crush to death a harmless insect, whose single offence is that he eats that food which nature has prepared for his sustenance, than it would be were we to kill any bulky creature for the same reason. There are few tempers so hardened to the impressions of humanity, as not to shudder at the thought of the latter; and yet the former is universally practised without the least check of compassion. This seems to arise from the gross error of supposing, that every creature is really in itself contemptible, which happens to be clothed with a body infinitely disproportionate to our own, not considering that *great* and *little* are merely relative terms. But the inimitable Shakespeare would teach us, that

—————the poor beetle that we tread upon,
In corp'ral suff'rance, feels a pang as great
As when a giant dies.—————

And indeed there is every reason to believe that the sensations of many insects are as exquisite as those of creatures of far more enlarged dimensions, perhaps even
more

Insect
||
insolvent.

more so. The millepede, for instance, rolls itself round upon the slightest touch, and the snail draws in its horns upon the least approach of our hand. Are not these the strongest indications of their sensibility? and is it any evidence of ours, that we are not therefore induced to treat them with a more sympathizing tenderness?

Montaigne remarks, that there is a certain claim of kindness and benevolence which every species of creatures has a right to from us. It is to be regretted that this general maxim is not more attended to in the affair of education, and pressed home upon tender minds in its full extent and latitude. We are far, indeed, from thinking, that the early delight which children discover in tormenting flies, &c. is a mark of any innate cruelty of temper, because this turn may be accounted for on other principles; and it is entertaining unworthy notions of the Deity, to suppose he forms mankind with a propensity to the most detestable of all dispositions: but most certainly, by being unrestrained in sports of this kind, they may acquire by habit what they never would have learned from nature, and grow up into a confirmed inattention to every kind of suffering but their own. Accordingly the supreme court of judicature at Athens thought an instance of this sort not below its cognizance, and punished a boy for putting out the eyes of a poor bird that had unhappily fallen into his hands.

It might be of service, therefore, it should seem, in order to awaken as early as possible in children an extensive sense of humanity, to give them a view of several sorts of insects as they may be magnified by the assistance of glasses, and to show them that the same evident marks of wisdom and goodness prevail in the formation of the minutest insect, as in that of the most enormous leviathan: that they are equally furnished with whatever is necessary, not only to the preservation, but the happiness of their beings in that class of existence which Providence has assigned them: in a word, that the whole construction of their respective organs distinctly proclaims them the objects of the divine benevolence, and therefore that they justly ought to be so of ours.

INSERTION, in *Anatomy*, the close conjunction of the vessels, tendons, fibres, and membranes of the body with some other parts.

INSINUATION denotes a cunning and covert way of creeping into any person's favour.

INSINUATION of a Will, among civilians, is the first production of it, or the leaving it with the register, in order to its probate. See WILL.

INSIPID, TASTELESS, that which has nothing in it pungent enough to affect the palate, tongue, &c. and to occasion that sensation we call *tasting*.

INSITIO, in *Botany*, denotes the same with engraving; viz. the act of inserting and uniting a cyon, bud, or the like, in the substance of the stock.

INSOLATION, in *Pharmacy*, a method of preparing certain fruits, drugs, &c. by exposing them to the heat of the sun's rays; either to dry, to mature, or to sharpen them; as is done in vinegar, figs, &c.—The word comes from the Latin verb *insolare*, which is used by Pliny and Columella, and signifies *to expose to the sun*.

INSOLVENT, a term applied to such persons as

have not wherewithal to pay their just debts. A person dying, and not leaving estate sufficient to discharge these, is said to die insolvent. Inspection
||
Inspiration.

Trial by INSPECTION, or EXAMINATION, is when, for the greater expedition of a cause, in some point or issue, being either the principal question, or arising collaterally out of it, but being evidently the object of sense, the judges of the court, upon the testimony of their own senses, shall decide the point in dispute. For, where the affirmative or negative of a question is matter of such obvious determination, it is not thought necessary to summon a jury to decide it; who are properly called in to inform the conscience of the court of dubious facts; and therefore, when the fact, from its nature, must be evident to the court either from ocular demonstration or other irrefragable proof, there the law departs from its usual resort, the verdict of 12 men, and relies on the judgment of the court alone. As in case of a suit to reverse a fine for non-age of the cognizor, or to set aside a statute or recognizance entered into by an infant; here, and in other cases of the like sort, a writ shall issue to the sheriff, commanding him that he constrain the said party to appear, that it may be ascertained by the view of his body by the king's justices, whether he be of full age or not: *Ut per aspectum corporis sui constare poterit justiciariis nostris, si predictus an sit plene ætatis necne*. If, however, the court has, upon inspection, any doubt of the age of the party (as may frequently be the case), it may proceed to take proofs of the part; and, particularly may examine the infant himself upon an oath of *voir dire, veritatem dicere*; that is, to make true answers to such questions as the court shall demand of him; or the court may examine his mother, his godfather, or the like.

INSPECTOR, a person to whom the care and conduct of any work is committed.

INSPECTORS, in the Roman law, were such persons as examined the quality and value of lands and effects, in order to the adjusting or proportioning taxes and impositions to every man's estate.

The Jews also have an officer, in their synagogue, whom they call *inspector*, or *hhazen*. His business consists principally in inspecting or overlooking the prayers and lessons, in preparing and showing them to the reader, and in standing by him to see he reads right; and, if he makes mistakes, he is to correct him.

INSPIRATION, among divines, &c. implies the conveying of certain extraordinary and supernatural notices or motions into the soul; or it denotes any supernatural influence of God upon the mind of a rational creature, whereby he is formed to any degree of intellectual improvements, to which he could not, or would not, in fact have attained in his present circumstances, in a natural way. Thus the prophets are said to have spoken by divine inspiration.

Some authors reduce the inspiration of the sacred writers to a particular care of Providence, which prevented any thing they had said from failing or coming to nought; maintaining, that they never were really-inspired either with knowledge or expression.

According to M. Simon, inspiration is no more than a direction of the Holy Spirit, which never permitted the sacred writers to be mistaken.

It is a common opinion, that the inspiration of the

Inspiration. Holy Spirit regards only the matter, not the style or words; and this seems to fall in with M. Simon's doctrine of direction.

Theological writers have enumerated several kinds of inspiration; such as an inspiration of superintendency, in which God does so influence and direct the mind of any person, as to keep him more secure from error in some various and complex discourse, than he would have been merely by the use of his natural faculties; plenary superintendent inspiration, which excludes any mixture of error at all from the performance so superintended; inspiration of elevation, where the faculties act in a regular, and, as it seems, in a common manner, yet are raised to an extraordinary degree, so that the composition shall, upon the whole, have more of the true sublime or pathetic, than natural genius could have given; and inspiration of suggestion, when the use of the faculties is superseded, and God does, as it were, speak directly to the mind, making such discoveries to it as it could not otherwise have obtained, and dictating the very words in which such discoveries are to be communicated, if they are designed as a message to others. It is generally allowed that the New Testament was written by a superintendent inspiration; for without this discourses and doctrines of Christ could not have been faithfully recorded by the evangelists and apostles; nor could they have assumed the authority of speaking the words of Christ, and evinced this authority by the actual exercise of miraculous powers: and besides, the sacred writings bear many obvious internal marks of their divine original, in the excellence of their doctrines, the spirituality and elevation of their design, the majesty and simplicity of their style, the agreement of their various parts, and their efficacy on mankind; to which may be added, that there has been in the Christian church, from its earliest ages, a constant tradition, that the sacred books were written by the extraordinary assistance of the Spirit, which must at least amount to superintendent inspiration. But it has been controverted whether this inspiration extended to every minute circumstance in their writings, so as to be in the most absolute sense plenary. Jerome, Grotius, Erasmus, Episcopius, and many others, maintain that it was not; whilst others contend, that the emphatical manner in which our Lord speaks of the agency of the Spirit upon them, and in which they themselves speak of their own writings, will justify our believing that their inspiration was plenary, unless there be very convincing evidence brought on the other side to prove that it was not: and if we allow, it is said, that there were some errors in the New Testament, as it came from the hands of the apostles, there may be great danger of subverting the main purpose and design of it; since there will be endless room to debate the importance both of facts and doctrines.

Among the Heathens, the priests and priestesses were said to be divinely inspired, when they gave oracles.—The poets also laid claim to it; and to this end they always invoked Apollo and the Muses at the beginning of any great work.

INSPIRATION, in *Physic*, is understood of that action of the breast, by which the air is admitted within the lungs; in which sense, inspiration is a

branch of respiration, and stands opposed to **EXPIRATION**.

This admission of the air depends immediately on its spring or elasticity, at the time when the cavity of the breast is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards: so that the air does not enter the lungs, because they are dilated; but those dilate, because the air enters within them. Nor is it the dilatation of the breast which draws in the air, as is commonly thought, though this is a condition absolutely necessary to inspiration; but an actual intrusion of the air into the lungs. See **RESPIRATION**.

INSPISSATING, in *Pharmacy*, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thinner parts.

INSBRUCK, a city of Germany, in the circle of Austria, and capital of the county of Tyrol, received its name from the river Inn, which runs by it. It has a noble castle or palace, formerly the residence of the archdukes of the house of Austria, with a cathedral where they are buried. The houses, though built in the German taste, are rather handsomer; and the streets, though narrow, are remarkably well paved. For the defence of this city the inhabitants can place but little confidence in their fortifications, which are very trifling. They seem rather to depend on the natural fastnesses of their country; which appear indeed to form a barrier, so perfectly inaccessible to any enemy, that even the great Gustavus Adolphus, after having overrun with his victorious arms the other parts of Germany, could never make any impression upon this. It is seated in a pleasant valley, in E. Long. 11. 27. N. Lat. 47. 10.

INSTALLATION, the act of giving visible possession of an order, rank, or office, by placing in the proper seat. See **INSTALMENT**.

INSTALMENT, a settling or inflating any person in a dignity. The word is derived from the Latin *in*, and *stallum*, a term used for a seat in church, in the choir, or a seat or bench in a court of justice, &c. Though Voßius is of opinion the word is of German origin.

INSTALMENT is chiefly used for the induction of a dean, prebendary, or other ecclesiastical dignitary, into the possession of his stall, or proper seat, in the cathedral church to which he belongs. This is sometimes also called *installation*.

INSTALMENT is likewise used for the ceremony, whereby the knights of the garter are placed in their rank, in the chapel of St George at Windsor.

INSTANT, a part of duration in which we perceive no succession; or it is that which takes up the time only of one idea in our minds.

INSTAURATION, the re-establishment, or re-stitution of a religion, a church, or the like, to its former state. The word is by some derived from the old Latin *instaurum*, which signified the "stock" of things necessary for the tilling and managing of grounds; as cattle, tools, harness, &c. But the word *instaurum* is only of the middle age: *instauratio* is of much greater antiquity, and by some derived from *instar*, "like," as importing a thing's being brought

Instep, Instinct. to its former likeness or appearance. See RESTAURATION.

INSTEP, in the manege, is that part of a horse's hind leg, which reaches from the ham to the pastern-joint.

1
Definition. INSTINCT, a certain power or disposition of mind, by which, independent of all instruction or experience, without deliberation, and without having any end in view, animals are unerringly directed to do spontaneously (A) whatever is necessary for the preservation of the individual or the continuation of the kind. Such in the human species is the instinct of sucking exerted immediately after birth; and such in the inferior creation is the instinct by which insects invariably deposit their eggs in situations most favourable for hatching and affording nourishment to their future progeny. These operations are necessary for the preservation of the individual and the continuation of the kind; but neither the infant nor the insect knows that they are necessary: they both act without having any end in view, and act uniformly without instruction and without experience.

The actions of the inferior animals are generally directed by instinct; those of man by reason. This at least is the case with respect to men in a state of civilization: in the savage state they are probably little less the slaves of instinct than the brutes themselves. Concerning human instincts, indeed, philosophers differ widely in opinion; some maintaining that man is endowed with a greater number of instincts than any species of brutes; whilst others deny that in human nature there is any power or propensity at all which can properly be called instinctive.

2
Different opinions respecting human instincts. This diversity of opinion may easily be traced to its source. There are not many original thinkers in the world. The greater part even of those who are called philosophers, implicitly adopt the opinions of certain masters whose authority they deem sufficient to supply the place of argument; and having chosen their respective guides, each maintains with zeal what his master taught, or is supposed to have taught. When Locke so successfully attacked the doctrine of innate ideas and innate principles of speculative truth, he was thought by many to have overturned at the same time all innate principles whatever; to have divested the human mind of every passion, affection, and instinct; and to have left in it nothing but the powers of sensation, memory, and intellect. Such, we are persuaded, was not his intention; nor is there any thing in his immortal work which, when interpreted with candour, appears to have such a tendency.

3
The cause of that difference.

In our opinion, great part of the *Essay on Human Understanding* has been very generally misunderstood. Much of its merit, however, was soon discovered; and mankind, finding philosophy disencumbered of the barbarous jargon of the schools, and built upon a few self-evident principles, implicitly embraced every opinion advanced, or which they supposed to be advanced, by the illustrious author; especially if that opinion was contrary to any part of the scholastic system which had so long been employed to perplex the understanding and to veil absurdity. Hence arose many philosophers of eminence both at home and abroad; who maintained, as they imagined, upon the principles of Locke, that in the human mind there are no instincts, but that every thing which had been usually called by that name is resolvable into association and habit. This doctrine was attacked by Lord Shaftesbury, who introduced into the theory of mind, as faculties derived from nature, a sense of beauty, a sense of honour, and a sense of ridicule; and these he considered as the tests of speculative truth and moral rectitude. His lordship's principles were in part adopted by Mr Hutcheson of Glasgow, who published a system of moral philosophy, founded upon a sense or instinct, to which he gave the name of the *moral sense*; and the undoubted merit of his work procured him many followers.

Men generally run from one extreme to another. It being now discovered, or at least supposed, that the human mind is endowed with instinctive principles of action, a sect of philosophers soon afterwards arose, who maintained with much vehemence that it is likewise endowed with instinctive principles of belief; and who built a system of metaphysics, if such it may be called, upon a number of innate, distinct, and independent senses. The rise of this sect is well known. Berkeley and Hume had adopted Locke's doctrine respecting the origin of our ideas; and had thence deduced consequences supposed to be dangerous in themselves, but which, it was thought, could not be denied without refusing the principles from which they were inferred. The foundation of the instinctive system being thus laid, the system itself was rapidly carried to a height far beyond what seems to have been the intention of its excellent author; and reason was well nigh banished from the regions of philosophy. For such a proceeding it is not difficult to assign the cause. The instinctive scheme requires much less labour of investigation than the systems of Locke and the ancients; for upon the principles of it, when carried to its utmost extent, every phenomenon in human nature is thought to be sufficiently accounted for, by supposing

M m 2

it

(A) As nothing is of greater importance in the philosophy of mind than accurate definitions, it may not be improper to observe, that through the whole of this article the word *spontaneous* is to be taken in the sense in which it is used in the following extracts from *Hales's Origin of Mankind*: "Many analogical motions in animals, though I cannot call them *voluntary*, yet I see them *spontaneous*: I have reason to conclude, that these are not simply *mechanical*." "The sagacities and instincts of brutes, the *spontaneousness* of many of their motions, are not explicable, without supposing some active determinate power connected to and inherent in their spirits, of a higher extraction than the bare natural modification of matter." If this be attended to, our definition of instinct will be found perfectly consonant to that which has been given by the author of *Ancient Metaphysics*. "Instinct (he says) is a determination given by Almighty Wisdom to the mind of the brute, to act in such or such a way, upon such or such an occasion, without intelligence, without knowledge of good or ill, and without knowing for what end or purpose he acts."

Instinct. it the effect of a particular instinct implanted in the mind for that very purpose. Hence in some popular works of philosophy we have a detail of so many distinct internal *senses*, that it requires no small strength of memory to retain their very names: besides the *moral sense*, we have the sense of *beauty*, the sense of *deformity*, the sense of *honour*, the *hoarding sense*, and a thousand others which it is needless here to mention.

This new system, which converts the philosophy of mind into mere history, or rather into a collection of facts and anecdotes, though it has made a rapid progress, is not yet universally received. It has been opposed by many speculative men, and by none with greater skill than Dr Priestley; who maintains, with the earliest admirers of Locke, that we have from nature no innate sense of truth, nor any instinctive principle of action; that even the action of sucking in new-born infants is to be accounted for upon principles of mechanism; and that the desire of the sexes is merely association.

While men, eminent for candour as well as for science, have thus been disputing the limits between instinct and reason in the human mind, and endeavouring to ascertain the actions which result from each, two writers of name, treating of that subject, have lately advanced opinions, which, if admitted as just, must render the dispute henceforth ridiculous, and put an end for ever to all moral inquiries. Mr Smellie, in a work which he calls *The Philosophy of Natural History*, affirms, that between *instinctive* and *rational motives* no distinction exists, but that the reasoning faculty itself is the necessary result of instinct; and Dr Reid, in his *Essays on the Active Powers of Man*, by attributing to *instinct* the action of breathing, seems to confound that principle with mere mechanism.

That reason, instinct, and mechanism, are all essentially different from one another, has hitherto been universally allowed; and it appears not to be a task of much difficulty to point out in what respect each of them differs from the other two. Actions performed with a view to accomplish a certain *end* are called *rational* actions, and the end in view is the *motive* to their performance. *Instinctive* actions have a *cause*, viz. the internal impulse by which they are spontaneously performed; but they cannot be said to have a *motive*, be-

cause they are not done with any *view to consequences*. *Instinct.* Actions *automatic* have likewise a cause; but that cause is not internal impulse, but *mere mechanism*, by which they are performed without any spontaneity of the agent. Thus, a man gives charity in order to relieve a person from want; he performs a grateful action as a duty incumbent on him; and he fights for his country in order to repel its enemies. Each of these actions is performed from a *motive*, and therefore they are all *rational* actions. An infant is impelled to suck the breast, but he knows not that it is necessary for his preservation; a couple of young savages go together, for the first time, without any view to offspring or any *determinate* idea of enjoyment. These actions have *no motive*, and therefore are not rational: but as they are performed by a *spontaneous exertion* of the agents, they are not to be attributed to mere mechanism; they are therefore *instinctive* actions. A man breathes without any motive, without any spontaneous exertion of his own, and that as well when he is asleep as when he is awake. The action of breathing therefore is neither rational nor instinctive, but merely *automatic* or *mechanical*. All this seems to be very plain. To talk of the motives of actions performed by instinct, in an argument intended to prove that between reason and instinct there is no difference, is either to beg the question or to pervert language. If the author of the *Philosophy of Natural History* chooses to call the *impulse* which prompts the infant to suck by the name of *motive*, he only uses an English word improperly; if it be his intention to affirm that such a motive is not totally and essentially different from that which prompts a man to give charity or to fight for his country, he affirms what all mankind know to be false (R).

Having thus ascertained what we mean by instinct, we shall now proceed to inquire, Whether or not there be any instinctive principles in man? But in order to proceed upon sure grounds, it will be proper to consider, in the first place, such actions of the inferior animals as are *generally* allowed to be instinctive: for an attempt has lately been made to prove, that even these actions are the offspring of reason influenced by motives; and that *instinct*, as we have defined it, is a mere imaginary principle, which has no existence either in man or brute.

It

(B) The author of *Ancient Metaphysics*, whose learned work contains more good sense on this subject than any other book which we have seen, thus distinguishes between reason and instinct: "With respect to the mere animal, it is evident, that he pursues nothing but what is conducive either to the preservation of the animal life or to the continuation of the kind. On the other hand, the object which the intellectual mind pursues, is the *fair* and the *handsome*; and its happiness consists in the contemplation of these. And though it pursue also what is *useful* and *profitable* for the being and well-being of the animal life, yet it is for the sake, not of the animal life itself, but of the *το καλον* or *beautiful*; which therefore is the ultimate object of its pursuit in all things.

"Another material difference in practice betwixt the animal and intellectual mind is, that every action of intellect proceeds from an opinion formed concerning what is good or ill, beautiful or the contrary, in the action. When we do so, we are said to act from *will*, which is always determined by some opinion formed of the kind I have mentioned: whereas, when we act from mere appetite or inclination, without deliberation or opinion formed, we act as the brute does always; for he has no *will*, but is prompted to action by natural impulse, or *ὄρεσις*, as the Greeks call it.

"A third very material difference is, that intellect, in all its operations, proposes ends, and devises means to accomplish these ends; whereas the instinct of the brute proceeds without consideration either of ends or means."

4
Instinct
confounded
with reason
and with
mechanism.

5
These three
principles
accurately
distinguish-
ed from
each other.

⁶ Instinct. It has been said that caterpillars, when shaken off a tree in every direction, instantly turn round towards the trunk and climb up, though they had never formerly been on the surface of the ground. This is a striking instance of instinct. On the tree, and not upon the ground, the caterpillar finds its food. If therefore it did not turn and climb up the trunk it would inevitably perish; but surely the caterpillar knows not that such an exertion is necessary to its preservation; and therefore it acts not from motives, but from blind impulse. The bee and the beaver are endowed with an instinct which has the appearance of foresight. They build magazines, and fill them with provisions; but the foresight is not theirs. Neither bees nor beavers know any thing of futurity. The solitary wasp digs holes in the sand, in each of which she deposits an egg. Though she certainly knows not that an animal is to proceed from that egg, and still less, if possible, that this animal must be nourished with other animals, she collects a few small green worms, which she rolls up in a circular form, and fixes in the hole in such a manner that they cannot move. When the wasp-worm is hatched, it is amply stored with the food which nature has destined for its support. The green worms are devoured in succession; and the number deposited is exactly proportioned to the time necessary for the growth and transformation of the wasp-worm into a fly; when it issues from the hole, and is capable of procuring its own nourishment. This instinct of the parent-wasp is the more remarkable, that she feeds not upon flesh herself. Birds of the same species, unless when restrained by peculiar circumstances, uniformly build their nests of the same materials, and in the same form and situation, though they inhabit very different climates; and the form and situation are always exactly suited to their nature, and calculated to afford them shelter and protection. When danger, or any other circumstance peculiar to certain countries, renders a deviation from the common form or situation of nests necessary, that deviation is made in an equal degree, and in the very same manner, by all the birds of one species; and it is never found to extend beyond the limits of the country where alone it can serve any good purpose. When removed by necessity from their eggs, birds return to them with haste and anxiety, and shift them so as to heat them equally; and it is worthy of observation, that their haste to return is always in proportion to the cold of the climate. But do birds reason, and all of the same species reason equally well, upon the nature and extent of danger, and upon the means by which it can best be avoided? Have birds any notion of equality, or do they know that heat is necessary for incubation? No: in all these operations men recognise the intentions of nature; but they are hid from the animals themselves, and therefore cannot operate upon them as motives.

Of the instinct of animals we shall give one instance more in the elegant and perspicuous language of Dr Reid. "Every manufacturing art among men (says that able writer) was invented by some man, improved by others, and brought to perfection by time and experience. Men learn to work in it by long practice, which produces a habit. The arts of men vary in every age and in every nation, and are found only in those men who have been taught them. The manufactures

of animals differ from those of men in many striking particulars. No animal of the species can claim the invention; no animal ever introduced any new improvement, or any variation from the former practice; every one of the species has equal skill from the beginning, without teaching, without experience, and without habit; every one has its art by a kind of inspiration. I do not mean that it is inspired with the principles or rules of the art, but with the ability of working in it to perfection, without any knowledge of its principles, rules, or end. The work of every animal is indeed like the works of nature, perfect in its kind, and can bear the most critical examination of the mechanic or the mathematician; of which a honey-comb is a striking instance.

⁷ Remarkable instance in the bee. "Bees, it is well known, construct their combs with small cells on both sides, fit both for holding their store of honey and for rearing their young. There are only three possible figures of the cells, which can make them all equal and similar, without any useless interstices. These are the equilateral triangle, the square, and the regular hexagon. Of the three, the hexagon is the most proper, both for convenience and strength. Bees, as if they knew this, make their cells regular hexagons. As the combs have cells on both sides, the cells may either be exactly opposite, having partition against partition, or the bottom of a cell may rest upon the partitions between the cells on the other side, which will serve as a buttress to strengthen it. The last way is the best for strength; accordingly the bottom of each cell rests against the point where three partitions meet on the other side, which gives it all the strength possible. The bottom of a cell may either be one plane, perpendicular to the side partitions; or it may be composed of several planes, meeting in a solid angle in the middle point. It is only in one of these two ways that all the cells can be similar without losing room. And, for the same intention, the planes, of which the bottom is composed, if there be more than one, must be three in number, and neither more nor fewer. It has been demonstrated, that by making the bottoms of the cells to consist of three planes meeting in a point, there is a saving of material and labour no way inconsiderable. The bees, as if acquainted with these principles of solid geometry, follow them most accurately; the bottom of each cell being composed of three planes, which make obtuse angles with the side partitions and with one another, and meet in a point in the middle of the bottom; the three angles of this bottom being supported by three partitions on the other side of the comb, and the point of it by the common intersection of these three partitions. One instance more of the mathematical skill displayed in the structure of a honey-comb deserves to be mentioned. It is a curious mathematical problem, *at what precise angle* the three planes which compose the bottom of a cell ought to meet, in order to make the greatest possible saving of material and labour. This is one of those problems belonging to the higher parts of mathematics, which are called problems of *maxima* and *minima*. The celebrated *McLaurin* resolved it by a fluxionary calculation, which is to be found in the Transactions of the Royal Society of London, and determined precisely the angle required. Upon the most exact mensuration which the subject could admit,

Instinct. he afterwards found, that it is the very angle in which the three planes in the bottom of the cell of a honey-comb do actually meet.

“ Shall we ask here, Who taught the bees the properties of solids, and to resolve problems of *maxima* and *minima*? If a honey-comb were a work of human art, every man of common sense would conclude, without hesitation, that he who invented the construction must have understood the principles on which it was constructed. We need not say that bees know none of these things. They work most geometrically without any knowledge of geometry; somewhat like a child, who by turning the handle of an organ makes good music without any knowledge of music. The art is not in the child, but in him who made the organ. In like manner, when a bee makes its combs so geometrically, the geometry is not in the bee, but in that great Geometrician who made the bee, and made all things in number, weight, and measure.”

8
Which cannot be confounded with the operations of reason. We have given a full detail of the structure of a honey-comb, because it is an effect of instinct which cannot be confounded with the operations of reason. The author of *The Natural History of Animals*, justly offended with that theory which treats of *instinctive motives*, which represents the human mind as a *bundle* of

instincts, and of which the object seems to be to degrade mankind to the level of brutes, has very laudably exerted his endeavours to detect its weakness, and to expose it to contempt. But in avoiding one extreme, he seems to have run into the other; and whilst he maintains the rights of his own species, he almost raises the brutes to the rank of men. “ It is better (he says) to share our rights with others than to be entirely deprived of them.” This is certainly true; and no good man will hesitate to prefer his theory to that of his antagonist; but we see no necessity for adopting either; the phenomena may be accounted for without degrading reason to the level of instinct, or elevating instinct to the dignity of reason.

9
We shall readily allow to Locke (c), that some of the inferior animals seem to have perceptions of particular truths, and within very narrow limits the faculty of reason; but we see no ground to suppose that their natural operations are performed with a view to consequences; and therefore cannot persuade ourselves, with this historian of theirs, that these operations are the result of a train of reasoning in the mind of the animal.

He acknowledges indeed, that their reasoning and thinking powers are remarkably deficient when compared with those of men; that they cannot take so full

(c) “ For if they have any ideas at all, and are not mere machines, as some would have them, we cannot deny them to have some reason. It seems as evident to me, that some of them do, in certain instances, reason, as that they have sense; but it is only in particular ideas, just as they received them from the senses. They are the best of them tied up within those narrow bounds, and have not, as I think, the faculty to enlarge them by any kind of abstraction.” *Essay on Human Understanding*, Book ii. chap. xi.

This is in part a just observation, and serves to account for many phenomena which later writers have derived from instinct. The author of *The Philosophy of Natural History* had “ a cat that frequented a closet, the door of which was fastened by a common iron latch. A window was situated near the door. When the door was shut, the cat gave herself no uneasiness. As soon as she tired of her confinement, she mounted on the sole of the window, and with her paw dexterously lifted the latch and came out.” This practice, which we are told continued for years, must have been the consequence of what Locke calls reasoning in particular ideas. It could not be the effect of instinct; for instinct is adapted only to a state of nature, in which cats have neither latches to lift nor doors to open; and as it is not said that the animal attempted to lift the latches of other doors, we are not authorised to infer that this particular action was the consequence of reasoning in ideas enlarged by abstraction: the cat had repeatedly seen one door opened by an exertion which she was capable of imitating. Yet that animals have no power of enlarging their ideas, is a position, of the truth of which, though it is advanced by Locke, we are by no means confident. It is well known that crows feed upon several kinds of shell-fish when within their reach; and that they contrive to break the shell by raising the fish to a great height, and letting it drop upon a stone or a rock. This may perhaps be considered as pure instinct directing the animal to the proper means of acquiring its food. But what is to be thought of the following fact, which was communicated to us by a gentleman whose veracity is unquestioned, and who, being totally unacquainted with the theories of philosophers, has of course no favourite hypothesis to support? In the spring of the year 1791, a pair of crows made their nest in a tree, of which there are several planted round his garden; and in his morning-walks he had often been amused by witnessing furious combats between them and a cat. One morning the battle raged more fiercely than usual, till at last the cat gave way and took shelter under a hedge, as if to wait a more favourable opportunity of retreating to the house. The crows continued for a short time to make a threatening noise; but perceiving that on the ground they could do nothing more than threaten, one of them lifted a stone from the middle of the garden and perched with it on a tree planted in the hedge, where she sat watching the motions of the enemy of her young. As the cat crept along under the hedge, the crow accompanied her by flying from branch to branch and from tree to tree; and when at last she ventured to quit her hiding-place, the crow, leaving the tree, and hovering over her in the air, let the stone drop from on high on her back. That the crow on this occasion reasoned, is self-evident; and it seems to be little less evident, that the ideas employed in her reasoning were enlarged beyond those which she had received from her senses. By her senses, she may have perceived, that the shell of a fish is broken by a fall; but could her senses inform her, that a cat would be wounded or driven off the field by the fall of a stone? No: from the effect of the one fall preserved in her memory, she must have inferred the other by her power of reasoning.

First a review of the past, nor look forward with so penetrating an eye to the future; that they do not accumulate observation upon observation, or add the experience of one generation to that of another: that their manners do not vary nor their customs fluctuate like ours; and that their arts always remain the same, without degeneracy and without improvement. "The crow (he observes) always builds its nest in the same way; every hen treats her young with the same measure of affection; even the dog, the horse, and the sagacious elephant, seem to act rather mechanically than with design. From such hasty observations as these, it has been inferred (he says), that the brutes are directed in their actions by some mysterious influence, which impels them to employ their powers unintentionally in performing actions beneficial to themselves, and suitable to their nature and circumstances."

And are these observations indeed hasty? and is this inference ill founded? To us the matter appears quite otherwise. If the arts of brutes and other animals have always remained the same without degeneracy, and without improvement; and if they be at the same time the result of reasoning, they must either be so perfect that they cannot be improved, or so imperfect that they cannot degenerate. That the structure of a honey-comb is imperfect, no man has ever imagined. We have seen, that, as far as we are capable of discerning the end which it is intended to serve, it is the most perfect structure possible: and therefore, if it be the result of the reasoning of the bee, the author must retract his assertion respecting the extent of the reasoning and thinking powers of inferior animals; and instead of saying that they are remarkably deficient when compared with those of men, affirm that they are infinitely more perfect. No human art has yet arrived at such perfection as that it might not be improved; no architect has ever built a town, or constructed a magazine, which he could mathematically demonstrate to be of the very best possible form for the end intended, and so absolutely perfect as to be incapable of improvement.

But the same author proceeds to affirm, that "the laws of analogical reasoning do not justify the idea that the brutes act, on any occasion, absolutely without design." Nay, he says, it seems more probable, "that the inferior animals, even in those instances in which we cannot distinguish the motives which actuate them, or the views with which they proceed, yet act with design, and extend their views, if not a great way, yet at least a certain length forward; than that they can be upon any occasion, such as in rearing of their young, building nests, &c. actuated merely by feeling, or overruled by some mysterious influence, under which they are nothing but insensible instruments." This last phrase is ambiguous. If by insensible instruments it be meant that the brutes are considered by the advocates for instinct as mere machines without the faculties of sensation and spontaneity, the author is combating a phantom of his own

creation; for we believe an opinion so absurd is not now maintained by any man, (see BRUTE.) But if by insensible instruments be meant such instruments as act spontaneously without being conscious of the end to which their actions lead, he appears not only to be egregiously mistaken in his conjecture respecting the design of brutes, but also to have advanced an hypothesis contradictory and inconsistent.

If it be true, that the inferior animals act with design, even in those instances in which we cannot distinguish their motives, their views may indeed extend but a little way when compared with infinity: but certainly they extend farther than ours; for there is no useful work of man constructed with such skill, but that, after it is finished, another man of equal education will be able to distinguish the general design of the artist. But if the inferior animals, on all occasions, act with design, we should be glad to know the design of the bees in forming the cells of their combs in the manner which we have so largely described. Do these little animals indeed know that a comb, consisting on both sides of hexagonal cells, with the bottom of each composed of several planes meeting in a certain solid angle, and so formed as that the bottom of a cell on the one side shall rest upon the partitions between the cells on the other side, is in all respects the most proper both for holding their stores of honey and for rearing their young? And do they likewise know, that its excellence arises from the precise figure and position of the cells, by which there is a very considerable saving of labour and materials, whilst the comb at the same time has the greatest possible strength, and the greatest possible capacity? If they know all this, and act with a view to these ends, it must indeed be confessed that bees are rational creatures, and that their thinking and reasoning powers far surpass those of men; for they have from the earliest ages made discoveries in the higher mathematics, which there is reason to believe were altogether unknown to the human race till the beginning of the present century, and which at this moment are beyond the comprehension of nine-tenths of mankind in the most enlightened nation on earth. If this be a conclusion too absurd to be admitted, there is no other alternative but either to suppose that by this artificial structure of their cells the bees have some other end in view, which we cannot distinguish; or to acknowledge that they are overruled by some mysterious influence, under which they are nothing but spontaneous agents, unconscious of the end to which their operations tend. Which of these conclusions is the most rational, we will not offer such an insult to the understanding of our readers, as to suppose the meanest of them capable of entertaining a doubt. That a honey-comb is constructed with design, we must readily admit; but the design is not in the bees, but in the Creator of the bees, who directs their operations to their own good, by what the author with great propriety terms a mysterious influence (D).

But he thinks it an unanswerable argument in support of an objection to it

(D) Though this way of acting is undoubtedly mysterious, "yet it should not appear extraordinary even to a man who is not a philosopher, as we see examples of it daily in our own species: For a man under the direction of another of superior understanding, will use means to accomplish an end, without having any idea of either;

Instinct. port of his theory, that in the performance of those actions, in which animals are said to be guided by unerring instinct, different individuals display different modes of conduct; and in his opinion, to talk of instinctive principles which admit of improvement, and accommodate themselves to circumstances, is merely to introduce new terms into the language of philosophy; for he affirms, that no such improvement or accommodation to circumstances can ever take place without a comparison of ideas and a deduction of inferences. It is probable that the author here alludes to those animals which, in their most important operations, are known to act differently in different countries. Thus the ostrich in Senegal, where the heat is excessive, neglects her eggs during the day, but sits upon them in the night. At the Cape of Good Hope, however, where the degree of heat is less, the ostrich, like other birds, sits upon her eggs both day and night. In countries infested with monkeys, many birds, which in other climates build in bushes and clefts of trees, suspend their nests upon slender twigs, and thus elude the rapacity of their enemies.

13
obviated.

It may be thought, that a determination of the mind of the brute to act so variously upon different occasions, can hardly be conceived without judgment or intelligence. But before our author had so confidently affirmed that such accommodation to circumstances can never take place without a comparison of ideas and a deduction of inferences, he would have done well to consider how nature acts in other organized bodies, such as the vegetable. We see that a vegetable, reared in the corner of a dark cellar, will bend itself towards the light which comes in at the window; and if it be made to grow in a flower-pot, with its head downwards, it will turn itself into the natural position of a plant. Can it be supposed, that the plant, in either case, does what it does from any judgment or opinion that it is best, and not from a necessary determination of its nature? But, further, to take the case of bodies unorganized, how shall we account for the phenomena which chemistry exhibits to us? When one body unites with another, and then, upon a third being presented to it, quits the first, and unites itself with it, shall we suppose that this preference proceeds from any predilection or opinion that it is better to cleave to the one than to the other, from any comparison of ideas or deduction of inferences? Or shall we not rather say, that it proceeds from an original law of nature impressed upon it by that Being who mediately or immediately directs every motion of every the minutest atom in the universe? And if so, why may not instinct be an original determination of the mind of the animal, of which it is part of the nature or essence to accommodate itself to certain circumstances, on which depends the preservation of the individual, or the continuation of the kind? Indeed it cannot be otherwise, if we have defined instinct properly; for no man ever supposed, that when animals work instinctively, they act for no purpose. It is only affirmed that the purpose is not known to them. It is known, however, to the Author

of instinct; who knows likewise that the same purpose must in different climates be promoted by different means, and who accordingly determines the operations of animals of the same species to be different under different circumstances.

But though we cannot agree with this author when he affirms that no accommodation to circumstances can ever take place without a comparison of ideas, we readily admit that no faculty which is capable of improvement by observation and experience can in propriety of speech be termed instinct. Instinct being a positive determination given to the minds of animals by the Author of nature for certain purposes, must necessarily be perfect when viewed in connection with those purposes: and therefore to talk, as Mr Smellie does, of the *improvement* of instinct, is to perplex the understanding by a perversion of language. There is not, however, a doubt, but that reason may copy the works of instinct, and so far alter or improve them as to render them subservient to other purposes than those for which they were originally and instinctively performed. It was thus in all probability that man at first learned many of the most useful arts of life.

- “Thy arts of building from the bee receive;
- “Learn of the mole to plough, the worm to weave;
- “Learn of the little nautilus to sail,
- “Spread the thin oar, and catch the driving gale.”

But the arts thus adopted by men are no longer the works of instinct, but the operations of reason influenced by motives. This is so obviously and undeniably true, that it has compelled the author last mentioned to confess, in that very section which treats of instincts improveable by experience, that “what men or brutes learn by experience, though this experience be founded on instinct, cannot with propriety be called instinctive knowledge, but knowledge derived from experience and observation. Instinct (he says) should be limited to such actions as every individual of a species exerts without the aid either of experience or imitation.” This is a very just distinction between instinct and experience; but how to reconcile it with the fundamental principle of the author’s theory we know not. It would certainly be a very arduous task; but it is a task from which we are happily relieved, as his theory and ours have little resemblance.

Having thus proved, we hope to the satisfaction of our readers, that there is such a principle as instinct in the inferior animals, and that it is essentially different from human reason; let us return to our own species, and inquire whether there be any occasions upon which man acts instinctively, and what those occasions are. This is a question of some difficulty, to which a complete and satisfactory answer will perhaps never be given, and to which we have not the vanity to think that such an answer will be given by us. The principle of *association* (to be explained afterwards under the article METAPHYSICS) operates so powerfully in man, and at so early a period of life, that in many cases it seems to be impossible to distinguish the effects

either; and indeed, in my opinion, by far the greater part of mankind are destined by God and nature to be governed in that way.” *Ancient Metaphysics*, vol. iii. p. 352.

instinct. of habit from the operations of nature. Yet there are a few cases immediately connected with the preservation of the individual and the propagation of the kind, in which by a little attention these things may be distinguished. We have already given an instance in the sucking of a child, which we believe to be an operation performed by instinct. Dr Priestley, however, thinks differently: "The action of sucking (says he), I am confident, from my own observations, is not natural, but acquired." What observations they were which led him to this conclusion he has not told us, and we cannot imagine; but every observation which we ourselves have made, compels us to believe that an attempt to suck is natural to children. It has been observed by the author of the Philosophy of Natural History, that the instinct of sucking is not excited by any smell peculiar to the mother, to milk, or to any other substance; for that infants suck indiscriminately every thing brought into contact with their mouths. He therefore infers, that the *desire* of sucking is innate, and coeval with the appetite for air. The observation is certainly just: but a disciple of Dr Priestley's may object to the inference; for "in sucking and swallowing our food, and in many such instances, it is exceedingly probable (says the doctor), that the actions of the muscles are originally *automatic*, having been so placed by our Maker, that at first they are stimulated and contract mechanically whenever their action is requisite." This is certainly the case with respect to the motion of the muscles in the action of breathing; and if that action be of the same kind and proceed from the very same cause with the action of sucking, and if a child never show a desire to suck but when something is brought into contact with its mouth, Dr Priestley's account of this operation appears to us much more satisfactory than that of the authors who attribute it to instinct.

16
stances of
man ac-
as un-
libedly
inactive.

But the actions of breathing and sucking seem to differ essentially in several particulars. They are indeed both performed by means of air; but in the former, a child for many months exerts no spontaneous effort, whilst a spontaneous effort seems to be absolutely necessary for the performance of the latter. Of this indeed we could not be certain, were it true that infants never exhibit symptoms of a *wish* to suck but when something is actually in contact with their mouths; for the mere *act* of sucking *then* might well be supposed to be automatic and the effect of irritation: But this is not the case. A healthy and vigorous infant, within ten minutes of its birth, gives the plainest and most unequivocal evidence of a desire to suck, before any thing be brought into actual contact with its mouth. It stretches out its neck, and turns its head from side to side apparently in quest of *something*: and that the object of its pursuit is something which it may *suck*, every man may satisfy himself by a very convincing experiment. When an infant is thus stretching out its neck and moving its head, if any thing be made to touch any part of its face, the little creature will instantly turn to the object, and endeavour by quick alternate motions from side to side to seize it with its mouth, in the very same manner in which it always seizes the breast of its nurse, till taught by experience to distinguish objects by the sense of sight, when these alternate motions, being no longer useful, are no longer

employed. If this be not an instance of pure instinct, we know not what it is. It cannot be the result of association or mechanism; for when the stretching of the neck takes place, nothing is in contact with the child's mouth, and no association which includes the act of sucking can have been formed. Associations of ideas are the consequences of simultaneous impressions frequently repeated; but when the child first declares, as plainly as it could do were it possessed of language, its wish to suck, it has not received a single impression with which that wish can possibly be associated.

Were Dr Priestley to weigh these facts, of the truth of which we are certain, we doubt not that his well-known candour would make him retract the assertion, that *all* the actions which Dr Reid and others refer to instinct, are either automatic or acquired. The greater part of those actions, as well as of the apparently instinctive principles of belief, we have no doubt are acquired; but we are persuaded that a child sucks its nurse as a bee builds its cell, by instinct, for upon no other hypothesis can we account for the spontaneous efforts exerted in both these operations: and we think it no disgrace to our species, that in some few cases we should act from the same principle with the inferior creation, as nothing seems more true than that,

—Reason raise o'er instinct as we can;

In this 'tis God that works, in that 'tis man.

We have said, that, in the savage state, the sexes go together for the first time by instinct, without any view to offspring, and perhaps with no *determinate* idea of enjoyment. This opinion, we believe, has been generally maintained; but it is controverted by Dr Hartley. "Here (says he) we are to observe, first, that when a general pleasurable state is introduced, either by direct impressions or by associated influences, the organs of generation must sympathize with this general state, for the same reasons as the other parts do. They must therefore be affected with vibrations in their nerves, which rise above indifference, into the limits of pleasure, from youth, health, grateful aliment, the pleasures of imagination, ambition, and sympathy, or any other cause which diffuses grateful vibrations over the whole system.—Secondly, as these organs are endued with a greater degree of sensibility than the other parts, from their make, and the peculiar structure and disposition of their nerves, whatever these be, we may expect that they should be more affected by those general pleasurable states of the nervous system than the other parts.—Thirdly, the distension of the cells of the *vesiculæ seminales* and of the *sinusæ* of the *uterus*, which take place about the time of puberty, must make these organs more particularly irritable then." His fourth observation respects a state widely different from that of nature, and therefore is nothing to the purpose: but his fifth is, that "the particular shame which regards the organs of generation, may, when considered as an associated circumstance, like other pains, be so far diminished as to fall within the limits of pleasure, and add considerably to the sum total."

To this excellent and able writer we may allow the truth of these observations (though some of them might certainly be controverted); and yet deny his conclusion, that "they are sufficient to account for the

Instinct. general desires which are observable in young persons, and that those desires are of a facitious nature." For supposing every thing which he mentions to take place by mere mechanism and association; that the organs of generation are irritated, and certain cells and sinuses distended; the only inference which can be fairly drawn from such premises is, that at the age of puberty young men and women must from these causes experience certain feelings and wants which they knew not before; but surely mechanism and association cannot teach them the use of the organs of generation, or point out the only means by which their new feelings can be gratified: and therefore, as we see these means invariably pursued by all animals rational and irrational, without experience and without instruction, we must refer the mutual desire of the sexes to a higher principle than mere mechanism and association; and that principle can be nothing but instinct.

Besides these, we think the action of eating may be attributed to instinct. It is certainly performed by a spontaneous exertion of the proper organs; and that exertion is first made at a time of life when we have no conception of the end which it serves to accomplish, and therefore cannot be influenced by motives. It must indeed be confessed, that the first act of chewing is performed by a child, not for the purpose of masticating food, but to quicken the operation of nature in the cutting of teeth: and perhaps it may be said, that the pleasing sensation of *taste*, which is then first experienced, and afterwards remembered, prompts the child to continue at intervals the exertion of chewing after all his teeth are cut; so that though the act of eating is not performed with a *view* to the mastication of food or the nourishment of the body, it may yet be performed, not from any instinctive impulse, but merely from an early and deep-rooted association. But in answer to this it is sufficient to ask, Who taught the infant that the act of chewing would quicken the operation of nature in the cutting of teeth? Not reason, surely, nor experience; for an infant knows nothing of teeth or the manner in which they grow: and if it be granted, that for this purpose it was originally impelled by some internal and mysterious influence to perform the action of chewing, we are not inclined to deny that the operation may be continued for other purposes by means of association.

In human works, though laboured on with pain,
A thousand movements scarce one purpose gain;
In God's, one single can its end produce,
Yet serves to second too some other use.

This is sound philosophy confirmed by observation and daily experience: but though in the works of God, one principle produces many consequences, and though perhaps there is not a principle which falls under our cognizance more fruitful than that of association, yet if it be not sufficient to account for the *first act* of chewing, we cannot refer to it alone as to the source of that operation. Should it be said, that the gums of an infant are at the period of cutting teeth so irritable, that the moment any thing is applied to them the jaws perform a motion merely automatic, which we mistake for the spontaneous effect of instinct; still we would ask, What prompts the child to apply every thing to its mouth? Does the irritation of the gums contract the

muscles of the arm? By a bigct for mechanism this might be said, were it true that the arm of an infant, like a piece of clock-work, is always so regularly moved as to bring its hand directly into contact with its gums: but this is far from being the case; an infant makes many unsuccessful efforts to reach its mouth, and does not accomplish its purpose till after repeated trials. Perhaps it may be alleged (for when men adopt a favourite hypothesis they will allege any thing in its support), that infants are taught to carry things to their mouths by the pleasing sensation received from the application of their nurses' breasts, and continue the practice from habit and association. But it is certain that they do not begin this practice till teeth are forming in their gums; and then they use such things as they themselves carry to their mouths very differently from the breasts of their nurse: they constantly chew and bite their rattles, though they very seldom bite their nurses. As this practice cannot be begun from a principle of association, so it appears to us that it cannot be continued upon such a principle. Were the sensation experienced by an infant when chewing a hard substance a pleasing sensation, the remembrance of the pleasure might as a motive prompt it to repeat the operation: but it is obvious, that by pressing a gum, through which a tooth is making its way, against any thing hard, the infant must experience a painful sensation; and therefore the influence which impels it to continue this operation, must be something more powerful than pleasure or pain.

These three actions, then, by which infants suck, by which they chew their food, and by which mankind are propagated, have undeniably their origin in instinct. There may be many other human actions which derive their origin from the same source; but in a state of civil society it is very difficult, if not impossible, to distinguish them from the effects of early habit.

Such, however, is the present impatience of that labour without which effects cannot be traced to their causes, that every phenomenon in human nature, which to former philosophers would have occasioned difficulty, is now thought to be sufficiently accounted for by referring it to some instinct as its particular cause; and he who can provide himself with a sufficient number of these instincts, for the reality of which he offers no proof, seats himself in the philosopher's chair, and dreams that he is dictating a system of science, whilst he is only retailing a collection of anecdotes. A philosopher of this school has lately carried the doctrine of instinctive principles so far, as to attribute the superiority of man over the other animals, chiefly to the great number of instincts with which his mind is endowed; and among these he reckons (not, we believe, as characteristic of our species in contradistinction to other animals, but as part of the instinctive bundle in the largeness of which our superiority consists) "the voiding of urine and excrement, sneezing, retraction of the muscles upon the application of any painful stimulus, the moving of the eyelids and other parts of the body." These (he says) are effects of original instincts, and essential to the existence of young animals. With this writer instinct is sometimes represented as looking into futurity, and acting upon motives which have hitherto been considered as the province of reason and the characteristic of man:

Instinct.

Instinct. man: here the same instinct is confounded with irritation and mechanism; and if this mode of philosophizing continue in fashion, we shall not be surprised to find men, beasts, birds, and vegetables, considered by some other writer as nothing more than different species of the same genus of beings, that are all actuated by the great and universal principle of instinct. If sneezing and the retraction of the muscles upon the application of any painful stimulus be actions of instinct, there cannot be a doubt, upon the received principles of philosophy, but that the contraction of the leaves of the sensitive plant upon the application of any stimulus proceeds likewise from instinct: nay, a piece of leather must be endowed with instinct: for it too retracts upon the application of the painful stimulus of fire. All these are evidently similar effects produced by the same or similar causes; for in the operations of sneezing and retracting the muscles upon any painful application, there is not the least spontaneous exertion on our part, no co-operation of mind more than in the contraction of the leather and the plant. With respect to the voiding of urine and excrement, it is obvious, that at first these operations are performed without any effort of spontaneity; and that a voluntary power over the muscles which are subservient to them is very gradually acquired. Urine and excrement irritate the bladder and guts, which are supplied with branches of the same nerves that supply the abdominal muscles. But it is well known that the irritation of one branch of a nerve brings on a contraction of the muscles which are supplied by the other branches. Urine and excrement therefore are evidently expelled by the mechanical contraction of the organs of excretion; and to attribute these evacuations to *instinct*, is equally absurd as to say, that water or any other soft substance pent up in a vessel, and pressed equally on all sides, makes its escape by *instinct* through the easiest passage. It is difficult to guess what the author means by the instinctive motion of the eyelids and other parts of the body. There is a motion of the eyelids which is voluntary, and another which is involuntary. The former proceeds from some motive, to exclude too great a glare of light, or to guard the eye against a foreseen mischief, and is therefore the result of reason as distinguished from instinct: the latter is obviously the effect of association, which took place in early infancy and produced a habit. Infants for several days after birth do not wink with their eyes upon the approach of one's hand or any other substance; but after having experienced pain from too much light or any other thing which hurts the eye, and that pain having at first produced an automatic motion of the eyelids, the motion comes in time to be so closely associated with its cause, that the very appearance of the latter produces the former. In all this there is no instinct, nor any thing which resembles instinct: in the one case, the motion of the eyelids is in the strictest sense voluntary and rational; and in the other, it is either automatic or the effect of habit.

“The love of light (says the same writer) is exhibited by infants at a very early period. I have remarked evident symptoms of this attachment on the third day after birth. When children are farther advanced, marks of the various passions generally appear. The passion of fear is discoverable at the

age of two months. It is called forth by approaching the hand to the child's eye, and by any sudden motion or unusual noise.” It has likewise been said, that “an infant may be put into a fright by an angry countenance, and soothed again by smiles and blandishments;” and “that all these are cases of pure instinct.” In reply to which, we scruple not to assert with Dr Priestley, that an infant (unless by an infant be meant a child who has a good deal of experience, and of course has made many observations on the connections of things) “is absolutely incapable of terror. I am positive (says he), that no child ever showed the least symptom of fear or apprehension till he had actually received hurts and had felt pain; and that children have no fear of any particular person or thing, but in consequence of some connection between that person or thing and the pain they have felt. If any instinct of this kind were more necessary than another, it would be the *dread of fire*. But every body must have observed, that infants show no sign of any such thing; for they will as readily put their finger to the flame of a candle as to any thing else, till they have been burned. But after some painful experience of this kind, their dread of fire, though undeniably the effect of association, becomes as quick and as effectual in its operations as if it were an original instinctive principle.” We moreover do not hesitate to say, with the same great philosopher, that if it were possible always to beat and terrify a child with a placid countenance, so as never to assume that appearance but in those circumstances, and always to soothe him with what we call an angry countenance, this connection of ideas would be reversed, and we should see the child frightened with a smile and delighted with a frown. In fact, there is no more reason to believe that a child is naturally afraid of a frown, than that he is afraid of being in the *dark*; and of this children certainly discover no sign, till they have either found something disagreeable to them in the dark, or have been told that there is something dreadful in it.

The truth of these observations is so obvious, that we doubt not but they will carry conviction to the mind of every reader. For though it should be granted, that so early as on the third day after birth children exhibit symptoms of uneasiness upon the sudden exclusion of light, it would by no means follow that the *love of light* is in them instinctive. Light operates upon the eye by contact, and communicates to the infant a sensation of touch. If that sensation be pleasant, the child must necessarily feel some degree of uneasiness upon its removal, just as a full grown man must feel uneasy upon being deprived of any positive pleasure. But is *sensation*, or *pleasure*, or the *removal of pleasure*, pure instinct? No, surely.

Thus difficult is it to say in many cases what actions have their origin in instinct, and what are merely the effects of early association. But we think it may be safely affirmed, that no action, whether of man or brute, which is deliberately performed with a *view* to consequences, can with any propriety be said to proceed from instinct; for such actions are the effect of reason influenced by motives. Deliberation and instinct are obviously incompatible. To say with the author of the Philosophy of Natural History, “that, when we are stimu-

Instinct.

luted by a particular instinct, instead of instantly obeying the impulse, another instinct arises in opposition, creates hesitation, and often totally extinguishes the *original motive* to action," is either to affirm what is apparently not true, or it is a gross perversion of language. *Motives* opposed to each other may create hesitation, and a powerful motive may counterbalance a feeble instinct; but of two or more instincts operating at the same time, and opposing each other, we have no conception. Instinct, if we choose to speak a language that is intelligible, means a certain impulse under the direction of Supreme Wisdom; and it is very little probable that such wisdom should give opposite impulses at the same instant. In the natural works of animals, which are confessedly under the influence of instinct, we perceive no symptoms of deliberation; but every one, when not interrupted by external violence, proceeds without hesitation in the direct road, to an end of which the animal itself knows nothing. The same would be the case with man were he under the guidance of instinct: and it is vain to say that the instinct of *fear* is daily counteracted by *ambition* and *resentment*, till it be proved that *fear*, *ambition*, and *resentment*, are really instincts. Of this, however, the author seems to have no doubt. Indeed his work is so liberally stored with these principles, so useful to every man who wishes to acquire the name of a philosopher without the labour of investigation, that not only *fear*, *ambition*, and *resentment*, but even *superstition*, *devotion*, *respect* for eminent characters, *avarice*, *hope*, *envy*, *benevolence*, and *sympathy*, are all, in his opinion, *instincts* simple or modified. The origin of *fear* we have already seen when examining the instincts said to exhibit themselves in early infancy: let us try if we cannot trace some other individuals of this numerous family to the same source of early associations.

19
Source of
this error.

The case then seems to be as follows. We first perceive or suppose some real good, i. e. some fitness to promote our happiness, in those things which we love or desire. Hence we annex to those things the idea of pleasure: with which they come, in time, to be so closely associated in our minds, that they cannot ever after present themselves without bringing that idea along with them. This association likewise often remains even after that which first gave rise to it is quite forgotten, or perhaps does not exist. An instance or two will make this very clear. No man can be born a lover of money; for in a state of nature money exists not: no man therefore can be born with our author's instinct of avarice, directed in the manner which the most *common* acceptance of that word denotes. Yet how many men are there in the world, who have as strong a desire for money as if that desire were innate and instinctive; who account so much money so much happiness; and who make the mere possession of gold and silver, without any thought or design of using them, the ultimate end of all their actions? This is not because the love of money is born with them, for that is impossible; but because they first perceive a great many advantages from the possession of money, whence they conceive a pleasure in having it. Hence they desire it, endeavour to obtain it, and feel an actual pleasure in obtaining and possessing it. Then, by dropping the intermediate steps between money and happiness, they join money and happiness immediately together, and content themselves with the

Instinct

fantastic pleasure of having it; making that which was at first pursued only as *means*, be to them an *ultimate end*, in which consists their happiness or misery. The same might be observed concerning the thirst after knowledge, fame, ambition, and most of the various pursuits of life. These are at first entered upon with a view to some farther end, but at length become habitual exercises; with which the idea of pleasure is so closely associated, that we continue the pursuit after the reason from which it was at first begun has entirely vanished from our minds. Hence also we may account for another of our author's *modified instincts*, the almost diabolical feeling of *envy*. Mr Locke observes, that there are some men entirely unacquainted with this passion. His observation we believe to be a just one; for most men that are used to reflection, remember the time when they were first under its influence; and though they did not, it is a thing very little likely that the beneficent Author of nature should have implanted in the human mind even the seeds of an instinct, which, in the emphatic language of the Rambler, "is mere unmixed and genuine evil." Envy is that pain which arises in the mind upon observing the success or prosperity of others; not however of *all* others indefinitely, but only of those with whom, upon some account or other, the envious person has once had a rivalry. But of such a feeling the origin is obvious; for when two or more persons are competitors for the same thing, the success of the one necessarily tends to the detriment of the other: hence the success of the one rival is in the mind of the other closely associated with pain or misery; and this association remaining after the rivalry which occasioned it has ceased, the person in whose mind envy is thus generated, always feels pain at the success of his rival even in affairs which have no relation to the original competition. Thus it is, that we are apt to envy those persons who refuse to be guided by our judgments, or persuaded by our arguments: for this is nothing else than a rivalry about the superiority of judgment; and we take a secret pride, both to let the world see, and in imagining ourselves, that in perspicuity and strength of judgment we have no superior.

Though the principle of association will be more fully explained in another place, there is one observation which must not be omitted here; it is, that we do not always, nor perhaps for the most part, make these associations ourselves, but learn them from others in very early life. We annex happiness or misery to certain things or actions, because we see it done by our parents or companions; and acquire principles of action by imitating those whom we esteem, or by being told, by those in whom we have been taught to place confidence, that such conduct will promote our happiness, and that the reverse will involve us in misery. Hence the son too often inherits both the vices and the virtues of his father as well as his estate; hence national virtues and vices, dispositions and opinions; and hence too it is, that habits formed before the period of distinct remembrance are so generally mistaken for natural instincts.

From the whole then of this investigation, we think ourselves warranted to conclude, that there is an essential difference between mechanism and instinct, and between both and reason; that mankind perform actions

Men perform rational, instinctive, and automatic actions.

stitutes by each of these principles, and that those actions ought to be carefully distinguished, and though the human mind is unquestionably endowed with a few instincts necessary to the preservation of the individual and the propagation of the race, that by far the greater part of those actions which are commonly said to proceed from instinct are merely the effects of early habits. We are likewise of opinion, that the present fashionable mode of referring almost every phenomenon in human nature to a particular instinct as its ultimate cause, is hurtful to science, as tending to check all further inquiry; and dangerous in morals, as making people implicitly follow, as the *dictates of nature and nature's God*, the *absurd, superstitious, or impious customs* of their respective countries.

INSTITUTES, in literary history, a book containing the elements of the Roman law.

The institutes are divided into four books; and contain an abridgment of the whole body of the civil law, being designed for the use of students. See *LAW Index*.

INSTITUTE, in *Scots Law*. When by disposition or deed of entail a number of persons are called to the succession of an estate one after another, the person first named is called the *institute*, the others *substitutes*.

National INSTITUTE of France, was founded by a decree of the new constitution, and opened on the 7th of December 1795. The abolition of royalty naturally suggested to the new rulers of France, that it would likewise be proper to abolish every thing which had the remotest connexion with it. Condorcet therefore proposed that the seven old academies, such as those of sciences, of inscriptions, &c. which had the term *royal* prefixed to the whole of them, should give way to the establishment of one new academy of arts and sciences, under the title of the *National Institute*.

The academy, or institute, is to consist of 288 members, the half of whom are to have their residence in Paris, and the rest in the different departments, with 24 foreign members.

This academy is divided into three classes; these are divided each into three sections, and each of these again is to consist of 12 members.

The *first class* consists of 10 sections, which are to preside over mathematics, mechanical arts, astronomy, experimental philosophy, chemistry, natural history, botany, anatomy and animal history, medicine and surgery, animal economy, and the veterinary science.

The *second class* has morality and politics for its department, and consists of six sections, viz. analysis of sensations and ideas, morals, legislature, political economy, history, and geography.

The *third class* presides over literature and the fine arts, consisting of eight sections, viz. universal grammar, ancient languages, poetry, antiquities, painting, sculpture, architecture, and music.—Several volumes of memoirs have been published by each of the classes.

The hall in which the whole classes hold their meetings four times a year, forms part of the west wing of the old Louvre, which was erected about the year 1528. It measures 144 feet by 40, and is capable of accommodating upwards of 1000 persons.

The schools of national instruction may be considered as forming a part of the same institution. These are,

1. The primary schools, one of which is established in every district, where children are taught the arts of reading and writing, the elements of French grammar, of arithmetic and geometry, &c. 2. The central schools, situated in the capital of every department, and one is allowed for every 300,000 inhabitants. 3. The schools of health, which are three in number, where medicine and surgery are studied. 4. Two schools for oriental languages. 5. The polytechnic school in Paris for the direction of public works, an establishment which is generally admired. 6. The national institute, of which we have already given some account.

The executive department of all these is vested in a supreme council at Paris. For the commodious execution of so many complicated branches, there is an extensive office called *Le Secretariat*, which is divided into three departments, for the regulation of the different kinds of instruction, for weights and measures, and for theatres, national feasts, the erection of monuments, &c.

By means of a permanent committee of instruction, under the authority of government, many improvements of a literary and scientific nature have been made, such as the National Bibliography, or complete catalogue of books of all descriptions; the annihilation of all dialects, which were incredibly numerous in France; the establishment of the *Conservatoire des Arts et M^{ét}iers*; of the board of longitude, the general school of the oriental languages, the national museum of antiquities, the new-modelling of the grand national library, the augmentation of the museum of natural history, the *ecole des mines*, and the society of natural history in Paris.

INSTITUTION, in general, signifies the establishing or founding something.—In the canon and common law, it signifies the vesting a clerk with the spiritualities of a rectory, &c. which is done by the bishop, who uses the following formula: "I institute you rector of such a church with the cure of souls, and receive your care and mine."

INSTITUTIONS, in literary matters, denote a system of the elements or rules of any art or science.

Thus physical or medicinal institutions are such as teach the necessary præcognita to the practice of medicine, or the cure of diseases.

INSTRUMENT, in general, whatever is subservient to a cause in producing any effect.

Mathematical, Philosophical, &c. INSTRUMENTS. See ASTRONOMY, ELECTRICITY, GEOMETRY, LEVELLING, MECHANICS, OPTICS, PNEUMATICS, &c. &c.

INSTRUMENT, is also used in law, to signify some public act, or authentic deed, by means whereof any truth is made apparent, or any right or title established, in a court of justice.

Notarial INSTRUMENT, in *Scots Law*, any fact certified in writing, under the hand of a notary-public.

INSUBRIUM ACER, in *Ancient Geography*, a district of the Transpadana; situated between the Ticinus to the west, the Addua to the east, the Padus to the south, and Orobii to the north. The people called *Insubres* by Livy, *Infulri* by Ptolemy, and *Isombres* by Strabo. Now the duchy of Milan.

INSULAR, any thing belonging to an island.—Insular situations are productive of many happy consequences to the inhabitants, both with respect to the climate,

Institution
||
Insular.

Insulated, Insurance. mate, security, and convenience for commerce; for a particular account of which, see ISLAND and COAST.

INSULATED, in *Architecture*, an appellation given to such columns as stand alone, or free from any contiguous wall, like an island in the sea; whence the name.

INSULATED, in electrical experiments. When any body is prevented from communicating with the earth by the interposition of an electric body, it is said to be *insulated*. See ELECTRICITY *Index*.

INSURANCE, in *Law and Commerce*, a contract, whereby one party engages to pay the losses which the other may sustain, for a stipulated premium or consideration. The most common sorts are, Insurance against the dangers of the seas, insurance against fire, insurance of debts, and insurance of lives.

According to Beckmann, the oldest laws and regulations respecting insurance, are the following.

On the 28th of January 1523, five persons who had received an appointment for that purpose, drew up some articles at Florence, which continue to be employed on the exchange at Leghorn. These interesting regulations, and the prescribed form of policies, which are deemed the oldest, were inserted by Magens, in his treatise on insurance, published at Hamburg in Italian and German, in the year 1753.

A short regulation of the 25th May 1537, by the emperor Charles V. respecting bills of exchange and insurance, is still preserved, in which even the fulfilling of an agreement is strictly commanded.

In the year 1536, Philip II. of Spain gave the Spanish merchants certain regulations respecting insurance, which Magens has inserted in the fore-mentioned work. They contain some forms of policies on ships going to the Indies.

The chamber of insurance was established at Amsterdam in 1598, an account of the first regulations of which office was published by Pontanus, in his history of that city.

Regulations respecting insurance were formed by the city of Middleburg in Zealand, in the year 1600; and it appears that the first regulations respecting insurances in England, were made in the following year. We find from them, that insurers, prior to this period, had secured the confidence of the public so completely, by the honesty and rectitude of their conduct, that few occasions for dispute had arisen*.

I. *INSURANCE against Loss at Sea*, is a most beneficial institution, for promoting the security of trade, and preventing the ruin of individuals; and is now conducted by a regular system of rules, established by the interposition of the legislature, the decision of the courts of justice, and the practice of merchants.

It is carried on to the best advantage by public companies, or by a considerable number of private persons, each of whom only engages for a small sum, on the same vessel. There are two public companies established by authority of parliament, viz. the London and Royal Exchange Insurance Companies. For procuring subscription by private persons, brokers are generally employed, who extend the policy or contract of insurance, and assist at settling losses. They are entitled to an allowance for their trouble, generally 5 per cent. on premiums, and 2 per cent. on losses.

The parties who engage to pay the damage are called the *insurers* or *underwriters*: the parties for whose security they engage are called the *insured*; and the premium is understood to be paid when the insurance is made.

On this subject, we shall consider, What is necessary to render an insurance valid:—When the risk commences, and when it terminates:—What constitutes a total or a partial loss:—What proof of loss is necessary:—and, How the loss is adjusted.

First, In order to render an insurance valid, the insured must have property really at stake; the voyage must take place under the circumstances agreed on; the dangers insured against must not be contrary to law, and a candid account must be given of circumstances which enhance the danger.

1. The condition of possessing property was required by 19 Geo. II. c. 37. to prevent ships from being fraudulently destroyed when insured above their value; and to discourage a practice which had become common, of converting policies to the purpose of mere wagers. In transactions of this kind, as the insured had no property, and could claim no indemnification for partial damage; so the insurers, having lost their wager by the ship's being lost, could claim no abatement, though part was saved: accordingly, the policies contained clauses of interest or no interest, free from average, and without benefit of salvage. All such policies are declared invalid.

This restriction does not extend to privateers, nor to ships trading to the Spanish or Portuguese plantations.

Insurances are commonly made as interest shall appear; and it is incumbent on the insured to prove the value of his property. The value of the goods may be proved by the invoices; and the coquet must be produced, if required, to instruct that the goods were actually shipped. It is admitted to value the ship at prime cost and charges, deducting the freights that have been drawn since purchased, if the proprietors choose to stand to that rule; but they are not restricted to it. Sometimes the value of the ship or goods is expressed in the policy; and this value must be admitted, although it be higher than the true one: but it is incumbent on the insured to prove that he had property at stake; and, if the property be trifling in comparison of the sum insured, the insurance will be set aside, as an evasion of the statute.

Expected profits, and bounty on the whale fishery, if specified in the policy, may be insured.

When the value is less than the sum insured, the owners may claim a return of premium for the excess.

If there be several policies on the same subject, of different dates, the earliest one is valid, and the others must be vacated. If they be of the same date, they must be vacated in equal proportions.

When a policy is vacated, in whole or in part, the underwriters have a right to retain $\frac{1}{4}$ per cent. for their trouble.

In the case of a cargo intended for A, but afterwards sent to B, both expected it, and insured, and B claimed for the value on its being lost. The underwriters answered, that it was a double insurance, and they ought only to pay their proportion. Judgment

* *Hist. of Invent.* vol. i. 382.

Insurance. was given, finding them liable for the whole, and reserving to them any demand competent against the underwriters who insured for A.

Fraudulently to cast away or destroy a ship insured above its value, is felony.

2. If the ship does not proceed on the voyage, or if, being warranted to depart with convoy, it departs without convoy, the insurance must be vacated.

If the extent of a trading voyage be uncertain, the longest one in contemplation is described in the policy, and it is agreed that part of the premium shall be returned, if the voyage be shortened. In like manner, in time of war, when insurance is made without condition of convoy, it is agreed that part of the premium be returned in case it fail with convoy.

When a ship is warranted to depart with convoy, it is understood from the usual place of convoy (e. g. the Downs), and it is insured till it arrive there.

The common proof of failing with convoy is the production of failing orders; but, if a ship be prevented by the weather from receiving the failing orders, other proof may be admitted.

A ship was insured from the Thames to Halifax, warranted to sail from Portsmouth with convoy. The convoy had failed before the ship arrived there, and the underwriters declined to insure it, without convoy, for the rest of the voyage. They were found liable to return part of the premium, retaining only in proportion to the accustomed rate from London to Portsmouth. This decision seems to establish the following principle, that, when the voyage performed is only part of that described in the policy, and when the risk can be proportioned, the underwriters are bound to return part of the premium, though there be no agreement for that purpose.

But, if a ship, insured only against the hazards of the sea, be taken by the enemy, the insured have no right to claim a return of premium, though the capture happen soon, under pretence that little sea-hazard was incurred.

If a ship deviates from the voyage described in the policy, without necessity, it sets aside the insurance. An intention to deviate is not sufficient to set it aside; there must be an actual deviation; and, even in that case, the insurers are liable for damages sustained before deviation.

It is no deviation to go out of the way to the accustomed place of convoy, nor to the nearest place where necessary repairs may be had. Deviation, for the purpose of smuggling, if without the knowledge of the owners, does not set aside the insurance, nor when the master is forced by the crew to return.

In insurance to the East Indies, and home, the insurers are understood to take the risk of detention in the country, and of country voyages.

3. Insurance of prohibited goods, against the risk of seizure by the government, is unlawful, and invalid. The insurers, insured, brokers, and all accessories, are liable to the fine of 500l.

4. If the insured have any information of more than common danger, they must reveal every such circumstance to the insurers, otherwise the policy is set aside.

This rule is established for the preservation of good faith; and there are several strong decisions in support

of it. If a ship be spoke to leaky at sea, or if there be a report of its being lost, these circumstances must be communicated to the insurers. Even the concealment of a false report of loss vitiates the insurance; and, if the ship be afterwards lost, though in a different manner, the insured will recover nothing. In a voyage from Carolina to London, another ship had failed ten days after that which was insured, and arrived seven days before the insurance was made; and the concealment of this circumstance, though the fact was not proved to the satisfaction of the jury, was considered as sufficient to set it aside. Also, during the continuance of the American war, a ship being insured from Portugal, by the month, without condescending on the voyage, sailed for North America, and was taken by a provincial privateer. The insurers refused to pay, because the hazardous destination was concealed; and it was only upon proof of the insured being equally ignorant of it that they were found liable.

But the insured are not obliged to take notice of general perils, which the insurers are understood to have in contemplation; dangerous navigation, West-Indian hurricanes, enterprises of the enemy, and the like.

Insurance is not set aside by a mistake in the name of the ship or master, or the like.

Insurance may be made on an uncertain ship; on any ship that the goods may be loaded on; on any ship that A shall sail in from Virginia. In this last case, the policy is not transferred to a ship which A goes on board during the voyage.

Secondly, If a ship be insured at and from a port, the insurance commences immediately if the ship be there, or at its arrival there. If it be damaged when preparing for a voyage, the insurers are liable; but not if the voyage be laid aside for several years, without consent of the owners. Insurance from a port commences when the ship breaks ground; and, if it set sail, and be driven back and lost in the port, the insurers are liable.

Insurance on goods generally continues till they be landed; but, if they be sold after the ship's arrival, and freight contracted to another port, the insurance is concluded. Goods sent on board another ship or lighter are not at the risk of the insurer; but goods sent aloft in the long boat are.

Insurance on freight commences when the goods are put on board.

Goods from the East Indies, insured to Gibraltar, and to be reshipped from thence to Britain, were put on board a store-ship at Gibraltar, to wait an opportunity of reshipping, and were lost: The custom of putting goods aboard a store-ship being proved, the insurers were found liable.

Loss of sails ashore, when the ship is repairing, is comprehended within the insurance. What is necessarily understood, is insured, as well as what is expressed; the essential means, and intermediate steps, as well as the end. Ships performing quarantine are at the risk of the insurer.

Thirdly, The insurers are liable for a total loss when the subject perishes through any of the perils insured against. Barratry, though it properly signifies running away with the ship, extends to any kind of fraud in

the

Insurance. the master of mariners. Insurance against detention of princes does not extend to ships that are seized for transgressing the laws of foreign countries.

The insurers are also liable for a total loss, when damage is sustained, and the remaining property abandoned or vested in the insurers.

If a ship be stranded, or taken, and kept by the enemy, or detained by any foreign power, or seized for the service of the government, the proprietors have a right to abandon.

But, if a ship be taken by the enemy, and be retaken, or makes its escape, before action against the insurers; have the insured a right to abandon, or must they only claim for the damages sustained as an average loss? There are opposite decisions, according as the circumstances of the case were strong. When the ship was long detained, the goods perishable, the voyage entirely lost, or so disturbed, that the pursuit of it was not worth the freight, or when the damage exceeds half the value of the thing, they have been found entitled to abandon; Goss against Withers, 2 Burrow, 683. But, if the voyage be completed with little trouble or delay, they are not entitled; (Hamilton against Mendez, 2 Burrow, 1198.).

The insured cannot claim, as for a total loss, on an offer to abandon, when the loss is, in its nature, only partial; for, if this were permitted, they might devolve the loss occasioned by bad markets on the insurers.

And, in all cases, the insured have their option to abandon, or not. They may retain their property if they please, and claim for an average loss; and they must make their option before they claim.

If the goods be so much damaged, that their value is less than the freight, the insurers are accountable as for a total loss.

The insurers are liable for general average, when the property is charged with contribution; and for particular average, when the property is damaged, or part of it destroyed.

If the damage be sustained through the fault of the ship, the owners of the goods may have recourse, either against the master or insurers; and, if the insurers be charged, they stand in the place of the owners, and have recourse against the master.

In order to prevent the insurers from being troubled with frivolous demands for average, it is generally stipulated, that none shall be charged under 5 per cent. or some other determined rate; and corn, flax, fruit, fish, and like perishable goods, are warranted free from average, unless general, or the ship be stranded.

In order to encourage every effort to save the ship, the insurers are liable for charges laid out with that design, although the subject perish. Thus, they may be charged with more than the sum insured.

In case of goods being damaged, the proportion of the sum insured, for which the underwriters are liable, is regulated by the proportion of the prices which the sound and damaged goods fetch at the port of destination. The prime cost of the goods is not considered, nor the necessity of immediate sale, in consequence of damage. Although the damaged goods sell above prime cost, the insurers are liable.

Fourthly, If a ship be lost, and the crew saved, the loss is proved by the evidence of the crew.

If damage be sustained, the extent is proved by an examination of the subject damaged, at the ship's arrival; and the cause by the evidence of the crew.

If the ship be stranded, evidence must be taken at the place where stranded.

Documents of loss must be laid before the underwriters, with all convenient speed; and, if these be sufficiently clear, the loss should be immediately settled. The underwriters generally grant their notes at a month or six weeks date for their proportions.

If a ship be not heard of for a certain time, it is presumed lost; and the underwriters are liable to pay the sums insured, the property being abandoned to them in the event of the ship's return. Six months are allowed for a voyage to any part of Europe, a year to America, and two years to the East Indies.

By the ordinance of Hamburgh, if a ship be three months beyond the usual time of performing a voyage, the underwriters may be desired to pay 92 per cent. on an abandon. If they decline it, they are allowed 14 months more, and then they must pay the full value.

A ship insured against the hazards of the sea, but not against the enemy, if never heard of, is presumed lost at sea.

Fifthly, In order that the manner of settling losses may be understood, we must explain what is meant by covering property. We mentioned already, that insurances for greater sums than the insured had really at stake, were contrary to law: but some latitude is allowed in that respect; for if the owner were to insure no more than the exact value of his property, he would lose the premium of insurance, and the abatement, if any was agreed on.

For example, if he has goods on board to the value of 100l. and insures the same at 5 per cent. to abate 2 per cent. in case of loss; then, if a total loss happen, he recovers 98l. from the insurers, of which 5l. being applied to re-place the premium, the nett sum saved is only 93l.; but, if the value on board be only 93l. and the sum insured 100l. he would be fully indemnified for the loss; and his property, in that case, is said to be covered.

To find how much should be insured to cover any sum, subtract the amount of the premium and abatement (if any) from 100l. As the remainder is to 100l. so is the value to the sum which covers it.

In case of a total loss, if the sum insured be not greater than that which covers the property, the insurers must pay it all. If greater, they pay what covers the property, and return the premium on the overplus.

Partial losses are regulated by this principle, that whereas the owner is not fully indemnified, in case of a total loss, unless he covers his property, therefore he should only be indemnified for a partial loss in the same proportion; and, if it be not fully insured, he is considered as insurer himself, for the part not covered, and must bear a suitable proportion of the loss. Therefore the value of the property is proved, and the sum required to cover it computed. If that sum be all insured, the underwriters pay the whole damage; if only part be insured, they pay their share, which is computed by the following rule: As the sum which covers the property is to the sum insured, so is the whole damage to the

Insurance. the part for which the insurers are liable.—For example, if the value of the property be 360*l.* the sum insured 300*l.* the premium 8 per cent. and abatement 2 per cent.; then the sum which should be insured to cover the property is 400*l.*; and, if damage be sustained to the extent of 200*l.* the owners will recover 150*l.*

If a voyage is insured out and home, the premium outward must be considered as part of the value on the homeward property, and the sum necessary to cover it computed accordingly. For example, to insure 100*l.* out and home, at 5 per cent. each voyage, abatement 2 per cent. we compute thus :

93 : 100 :: L. 100 : L. 107 : 10 : 6, to be insured outward, premium on L. 107 : 10 : 6 outwards, at 5 per cent. L. 5 : 7 : 6 : 93 : 100 :: L. 105 : 7 : 6 : L. 113 : 6*s.* to be insured home; the premium on which is L. 5 : 13 : 6; and, if the ship be lost on the homeward voyage,

II. *INSURANCE against Fire.* There are several offices in Britain for this purpose, of which the Sun fire-office is the most considerable. Insurances are divided into common, hazardous, and doubly hazardous, according to the nature of the subject insured. When the sum insured is high, there is a higher premium per cent. demanded; and money, papers, jewels, pictures, and gunpowder, are not comprehended. If a subject be wrong described, in order that it may be insured at a lower premium, the policy is void. The benefit of a policy is transferred, by indorsement, to the representatives of the person in whose favour it was made; and it may be transferred to other houses when the insured changes his habitation. If insurance be made on the same subject in different offices, it must be specified, by indorsement, on the policy; and, in case of loss, the offices pay proportionally. The insurers pay all expences in attempting to extinguish fire, or save goods, though not successful. If the value of a subject be insured in part, and damage be sustained, the insurers pay the whole, if it does not exceed the sum insured.

III. *INSURANCE of Debts.* See *BOTTOMRY.*

IV. In virtue of *INSURANCE for Lives*, when the person dies, a sum of money becomes payable to the person on whose behalf the policy of insurance was granted. One of the principal insurance-offices of this kind, is that of the Amicable Society for a perpetual insurance, kept in Serjeant's-inn, Fleet-street, London.

This society at Serjeant's-inn requires an annual payment of 5*l.* from every member during life, payable quarterly. The whole annual income hence arising is equally divided among the nominees, or heirs, of such members as die every year; and this renders the dividend, among the nominees, in different years, more or less, according to the number of members who have happened to die in those years. But this

society engages that the dividends shall not be less than 150*l.* to each claimant, though they may be more.—None are admitted whose ages are greater than 45, or less than 12; nor is there any difference of contribution allowed on account of difference of age.—This society has subsisted ever since 1706, and its credit and usefulness are well established. Its plan, however, is liable to several objections. First, it is evident, that regulating the dividends among the nominees, by the number of members who die every year, is not equitable; because it makes the benefit which a member is to receive to depend, not on the value of his contribution, but on a contingency; that is, the number of members that shall happen to die the same year with him. Secondly, its requiring the same payments from all persons under 45, is also not equitable; for the payment of a person admitted at 12 ought not to be more than half the payment of a person admitted at 45. Thirdly, its plan is so narrow, as to confine its usefulness too much. It can be of no service to any person whose age exceeds 45. It is likewise by no means properly adapted to the circumstances of persons who want to make assurances on their lives for only one year, or a short term of years. For example: the true value of the assurance of 150*l.* for five years, on the life of a person whose age is 39, may be found, by the first rule, to be nearly three guineas per annum, supposing interest at 3 per cent. and the probabilities of the duration of human life, as they are given in Dr Halley's Table of Observations. But such an assurance could not be made in this society without an annual payment of 5*l.* Neither is the plan of this society at all adapted to the circumstances of persons who want to make assurances on particular survivorships. For example: a person possessed of an estate or salary, which must be lost with his life, has a person dependent upon him, for whom he desires to secure a sum of money payable at his death. But he desires this only as a security against the danger of his dying first, and leaving a wife, or a parent, without support. In these circumstances he enters himself into this society; and, by an annual payment of 5*l.* entitles his nominee at his death to 150*l.* In a few years, perhaps, his nominee happens to die; and having then lost the advantages he had in view, he determines to forfeit his former payments, and to withdraw from the society. The right method, in this case, would have been to have taken from such a person the true value of the sum assured, "on the supposition of non-payment, provided he should survive." In this way he would have chosen to contract with the society: and had he done this, he would have paid for the assurance (supposing interest at 3 per cent. his age 30, the age of his nominee 30, and the values of lives as given by M. de Moivre) 3*l.* 8*s.* in annual payments, to begin immediately, and to be continued during the joint duration of his own life, and the life of his nominee.

The Equitable Society for Assurances on Lives and Survivorships, which meets at Blackfriars Bridge, is one of the most important of the kind. It was established in the year 1762, in consequence of proposals made, and lectures recommending the design, which had been read by Mr Dodson, author of the Mathematical Repository. It assures any sums or reversionary annuities, on any life or lives, for any number of years, as well as for the whole continuance of the lives; and t

Insurance. in any manner that may be best adapted to the views of the persons assured. For instance, any persons who depend on incomes which must be lost when they die, or who are only tenants for life in estates, may, if they want to borrow money, be enabled to give sufficient security, by assuring such sums as they want to borrow, and assigning the policy. In the same way clergymen, and others who hold places of profit, having families whose subsistence depends on the continuance of their lives; such as enjoy annuities for the lives of others; any person entitled to an estate, legacy, &c. after another person, provided he survives; husbands may provide annuities for their wives, if they leave them widows; parents may, by assuring the lives of their children, when infants, till they attain a given age, secure for them, should they live till that age, sums necessary for apprenticeships, &c.; persons apprehensive of being left without support in old age, may here purchase annuities, if willing to wait for the commencement of the payment of these till they are 55 or 60 years of age.

In fine, there are no kinds of assurances on lives and survivorships, which this society does not make, following the rules given by the best mathematical writers on life annuities, particularly Mr Simson's. In order to gain such a profit as may render it a permanent benefit to the public, and enable it to bear the expences of management, it takes the advantage of making its calculations at so low an interest as 3 per cent. and from tables of the probabilities and values of lives in London, where, as in all great towns, the rate of human mortality is much greater than it is in common among mankind.

This society, finding in the month of June 1777, that their affairs were in a flourishing condition, came to a resolution to reduce their annual premiums one-tenth; and they adopted new tables in the year 1782, founded on the probabilities of life at Northampton, instead of those which were framed from the London bills of mortality. It was afterwards thought proper to make an addition, for greater security, of 15 per cent. to the true value of the assurances, as calculated from the table of mortality at Northampton. To make a suitable recompense to the assured for the payments they had formerly made, which had been greater than the new rates required, an addition of 1l. 10s. was made to their claims for every premium they had paid. The result of this measure was, that in 1785 the business of the society was nearly doubled, the sums assured amounting to 720,000l. In consequence of a minute investigation, the society took off the 15 per cent. charged on premiums in 1782, and added 1l. per cent. more to the assurers's claims, for every payment made before the 1st of January 1786. Business still increasing, they made another addition of 1l. per cent. in 1791; and in the subsequent year a farther addition of 2l. per cent. by which the claims of such as assured in 1770 came to be more than doubled, and those of a prior date were still higher. By such integrity and consequent increase of business, the sums assured amounted, on the 31st of December 1792, to the astonishing sum of three millions sterling; and exactly three years after, they amounted to about one million more.

The rates of assurance, as reduced to their real values in 1786, according to which all business is now transacted, are the following.

Sum assured 100l.

Age.	One year.			Seven years.			Whole life.		
	£.	s.	d.	£.	s.	d.	£.	s.	d.
15	0	17	11	1	2	11	1	18	7

The other offices in London for the assurances of lives are,

The Royal Exchange Assurance, which was empowered to assure lives by virtue of its second charter, bearing date the 29th of April 1721; the Westminster Society was established in 1792, for assuring lives and annuities; and the Pelican Life Office was instituted in 1797, which makes a new species of assurance, by way of endowment for daughters, when they have attained the age of 21 years.

Re-INSURANCE is a second contract, made by any insurer, to transfer the risk he has engaged for to another. It is in general forbidden by 19 Geo. II. c. 37. but is permitted to the representatives of an insurer in case of his death, or his assignees in case of his bankruptcy; and it must be mentioned in the policy that it is a re-insurance.

INTAGLIOS, precious stones on which are engraved the heads of great men, inscriptions, and the like; such as we frequently see set in rings, seals, &c.

INTEGER, in *Arithmetic*, a whole number, in contradistinction to a fraction.

INTEGRAL, or **INTEGRANT**, in *Philosophy*, appellations given to parts of bodies which are of a similar nature with the whole: thus filings of iron have the same nature and properties as bars of iron.

Bodies may be reduced into their integrant parts by triture or grinding, limation or filing, solution, amalgamation, &c. See **GRINDING**.

INTEGRAL Calculus, in the new analysis, is the reverse of the differential calculus, and is the finding of the integral from a given differential; being similar to the inverse method of fluxions. See **FLUXIONS**.

INTEGUMENTS, in *Anatomy*, denote the common coverings which invest the body; as the cuticula, cutis, &c. See **ANATOMY**.

INTEGUMENT is also extended to the particular membranes which invest certain parts of the body; as the coats or tunics of the eye.

INTELLECT, a term used among philosophers, to signify that faculty of the soul usually called the *understanding*. See **LOGIC** and **METAPHYSICS**.

INTENDANT, one who has the conduct, inspection, and management of any thing. See **SUPERINTENDANT**.

This is a title frequent among the French: they have *intendants of the marine*, who are officers in the sea-ports,

Intendments ports, whose business it is to take care the ordinances and regulations relating to sea affairs be observed: *intendants of the finances*, who have the direction of the revenues: *intendants of provinces*, who are appointed by the king to take care of the administration of justice, policy, and finances in the province: also *intendants of buildings, of houses, &c.*

INTENDMENT, in *Law*, is the intention, design, or true meaning, of a person or thing which frequently supplies what is not fully expressed; but though the intent of parties in deeds and contracts is much regarded by the law, yet it cannot take place against the rules of law.

INTENDMENT of Crimes; this, in case of treason where the intention is proved by circumstances, is punishable in the same manner as if it was put in execution. So, if a person enter a house in the night-time, with an intent to commit burglary, it is felony; also, an assault, with an intent to commit a robbery on the highway is made felony, and punished with transportation, 7 Geo. 11. c. 21.

INTENT, in the civil law, signifies to begin, or commence, an action or process.

INTENTION, in *Medicine*, that judgment or method of cure which a physician forms to himself from a due examination of symptoms.

INTENTION, in *Physics*, the increase of the power or energy of any quality; as heat, cold, &c. by which it stands opposed to *remission*, which signifies its decrease or diminution.

INTENTION, in *Metaphysics*, denotes an exertion of the intellectual faculties with more than ordinary vigour; when the mind with earnestness fixes its view on any idea, considers it on all sides, and will not be called off by any solicitation.

INTERAMNA, in *Ancient Geography*, so called from its situation between rivers, or in an island in the river Nar; a town of the Cisapennine Umbria. *Interamnatæ* the people; surnamed *Nartes* by Pliny, to distinguish them from the people of other Interamnæ. Now *Terni*: a town in the pope's territory in Umbria. E. Long. 13. 38. N. Lat. 42. 40.

INTERAMNA, a town and colony of the Volsci in Latium, on the confines of Samnium, at the confluence of the rivers Liris and Melpis; and for distinction sake called *Lirinas*. The town is now in ruins.

INTERAMNA, or *Interamnia Præutianorum* (Ptolemy); a town in the territory of the Præutiani, a part of the Picenum. Now *Teramo*, in the Abruzzo of Naples. E. Long. 15. N. Lat. 42. 40.

INTERCALARY, an appellation given to the odd day intercalated in leap-year; which was so called from *calo, calare*, "to proclaim," it being proclaimed by the priests with a loud voice.

INTERCATIA, in *Ancient Geography*, a town of the Vaccæi in the Hither Spain. Here Scipio Æmilianus slew a champion of the barbarians in single combat; and was the first who mounted the wall in taking the town. It was situated to the south-east of Asturia; now said to be in ruins.

INTERCESSION (*intercessio*), was used in ancient Rome, for the act of a tribune of the people, or other magistrate, by which he inhibited the acts of other magistrates; or even, in case of the tribunes, the decrees of the senate. *Veto* was the solemn word used

by the tribunes when they inhibited any decree of the senate or law proposed to the people. The general law of these intercessions was, that any magistrate might inhibit the acts of his equal or inferior; but the tribunes had the sole prerogative of controlling the acts of every other magistrate, yet could not be controlled themselves by any.

INTERCESSOR (from *inter* and *cedo* "I go between"), a person who prays, expostulates, or intercedes, in behalf of another. In the Roman law, intercessor was the name of an officer, whom the governors of provinces appointed principally to raise taxes and other duties.

INTERCESSOR, is also a term heretofore applied to such bishops as, during the vacancy of a see, administered the bishoprick, till a successor to the deceased bishop had been elected. The third council of Carthage calls these *interventors*.

INTERCOLUMNIATION, in *Architecture*, denotes the space between two columns, which is always to be proportioned to the height and bulk of the columns.

INTERCOSTAL, in *Anatomy*, an appellation given to such muscles, nerves, arteries, and veins, as lie between the ribs.

INTERDICT, an ecclesiastical censure, by which the church of Rome forbids the performance of divine service in a kingdom, province, town, &c. This censure has been frequently executed in France, Italy, and Germany; and in the year 1170, Pope Alexander III. put all England under an interdict, forbidding the clergy to perform any part of divine service, except baptizing of infants, taking confessions, and giving absolution to dying penitents. But this censure being liable to the ill consequences of promoting libertinism and a neglect of religion, the succeeding popes have very seldom made use of it.

There was also an interdict of persons, who were deprived of the benefit of attending on divine service. Particular persons were also anciently interdicted of fire and water, which signified a banishment for some particular offence; by their censure no person was allowed to receive them, or allow them fire or water; and being thus wholly deprived of the two necessary elements of life, they were doubtless under a kind of civil death.

INTEREST, is the premium or money paid for the loan or use of other money.

Many good and learned men have in former times very much perplexed themselves and other people by raising doubts about the legality of interest in *foro conscientie*. It may not be amiss here to inquire upon what grounds this matter does really stand.

The enemies to interest in general make no distinction between that and usury, holding any increase of money to be indefensibly usurious. And this they ground as well on the prohibition of it by the law of Moses among the Jews, as also upon what is laid down by Aristotle, That money is naturally barren; and to make it breed money is preposterous, and a perversion of the end of its institution, which was only to serve the purposes of exchange, and not of increase. Hence the school-divines have branded the practice of taking interest, as being contrary to the divine law both natural and revealed; and the canon law has proscribed

Inter st. the taking any the least increase for the loan of money as a mortal sin.

But, in answer to this, it may be observed, that the Mosaic precept was clearly a political, and not a moral, precept. It only prohibited the Jews from taking usury from their brethren the Jews; but in express words permitted them to take it of a stranger: which proves that the taking of moderate usury, or a reward for the use, for so the word signifies, is not *malum in se*, since it was allowed where any but an Israelite was concerned. And as to Aristotle's reason, deduced from the natural barrenness of money, the same may with equal force be alleged of houses, which never breed houses; and twenty other things, which nobody doubts it is lawful to make profit of, by letting them to hire. And though money was originally used only for the purposes of exchange, yet the laws of any state may be well justified in permitting it to be turned to the purposes of profit, if the convenience of society (the great end for which money was invented) shall require it. And that the allowance of moderate interest tends greatly to the benefit of the public, especially in a trading country, will appear from that generally acknowledged principle, that commerce cannot subsist without mutual and extensive credit. Unless money therefore can be borrowed, trade cannot be carried on: and if no premium were allowed for the hire of money, few persons would care to lend it; or at least the ease of borrowing at a short warning (which is the life of commerce) would be entirely at an end. Thus, in the dark ages of monkish superstition and civil tyranny, when interest was laid under a total interdiction, commerce was also at its lowest ebb, and fell entirely into the hands of the Jews and Lombards: but when men's minds began to be more enlarged, when true religion and real liberty revived, commerce grew again into credit; and again introduced with itself its inseparable companion, the doctrine of loans upon interest.

And, really, considered abstractedly from this its use, since all other conveniences of life may be either bought or hired, but money can only be hired, there seems no greater impropriety in taking a recompense or price for the hire of this, than of any other convenience. If one borrow 100*l.* to employ in a beneficial trade, it is but equitable that the lender should have a proportion of the gains. To demand an exorbitant price is equally contrary to conscience, for the loan of a horse, or the loan of a sum of money: but a reasonable equivalent for the temporary inconvenience which the owner may feel by the want of it, and for the hazard of his losing it entirely, is not more immoral in one case than it is in the other. And indeed the absolute prohibition of lending upon any, even moderate interest, introduces the very inconvenience which it seems meant to remedy. The necessity of individuals will make borrowing unavoidable. Without some profit by law, there will be but few lenders: and those principally bad men, who will break through the law, and take a profit; and then will endeavour to indemnify themselves from the danger of the penalty, by making that profit exorbitant. Thus, while all degrees of profit were discountenanced, we find more complaints of usury, and more flagrant instances of oppression, than in modern times when money may be

easily had at a low interest. A capital distinction must therefore be made between a moderate and exorbitant profit; to the former of which we usually give the name of *interest*, to the latter the truly odious appellation of *usury*: the former is necessary in every civil state; if it were but to exclude the latter, which ought never to be tolerated in any well regulated society.— For, as the whole of this matter is well summed up by Grotius, “if the compensation allowed by law does not exceed the proportion of the hazard run, or the want felt, by the loan, its allowance is neither repugnant to the revealed nor to the natural law: but if it exceeds those bounds, it is then oppressive usury; and though the municipal laws may give it impunity, they never can make it just.”

We see, that the exorbitance or moderation of interest, for the money lent, depends upon two circumstances; the inconvenience of parting with it for the present, and the hazard of losing it entirely. The inconvenience to individual lenders can never be estimated by laws; the rate therefore of general interest must depend upon the usual or general inconvenience. This results entirely from the quantity of specie or current money in the kingdom: for, the more specie there is circulating in any nation, the greater superfluity there will be, beyond what is necessary to carry on the business of exchange and the common concerns of life. In every nation, or public community, there is a certain quantity of money thus necessary; which a person well skilled in political arithmetic might perhaps calculate as exactly as a private banker can the demand for running cash in his own shop: all above this necessary quantity may be spared, or lent, without much inconvenience to the respective leaders; and the greater this national superfluity is, the more numerous will be the lenders, and the lower ought the rate of the national interest to be; but where there is not enough, or barely enough, circulating cash to answer the ordinary uses of the public, interest will be proportionably high; for lenders will be but few, as few can submit to the inconvenience of lending.

So also the hazard of an entire loss has its weight in the regulation of interest: hence, the better the security, the lower will the interest be; the rate of interest being generally in a compound *ratio*, formed out of the inconvenience and the hazard. And as, if there were no inconvenience, there should be no interest but what is equivalent to the hazard; so, if there were no hazard, there ought to be no interest, save only what arises from the mere inconvenience of lending. Thus, if the quantity of specie in a nation be such, that the general inconvenience of lending for a year is computed to amount to three per cent. a man that has money by him will perhaps lend it upon good personal security at five per cent. allowing two for the hazard run; he will lend it upon landed security, or mortgage, at four per cent. the hazard being proportionably less; but he will lend it to the state, on the maintenance of which all his property depends, at three per cent. the hazard being none at all.

But sometimes the hazard may be greater than the rate of interest allowed by law will compensate. And this gives rise to the practice, 1. Of bottomry, or *respondentia*. 2. Of policies of insurance. See BOTTOMRY, and INSURANCE.

terest
||
Interim.

Upon the two principles of inconvenience and hazard, compared together, different nations have at different times established different rates of interest. The Romans at one time allowed *centissimæ*, one per cent. monthly, or twelve per cent. per annum, to be taken for common loans: but Justinian reduced it to *trientes*, or one-third of the *as* or *centissimæ*, that is four per cent.; but allowed higher interest to be taken of merchants, because there the hazard was greater. So too Grotius informs us, that in Holland the rate of interest was then eight per cent. in common loans, but twelve to merchants. Our law establishes one standard for all alike, where the pledge or security itself is not put in jeopardy; lest, under the general pretence of vague and indeterminate hazards, a door should be opened to fraud and usury; leaving specific hazards to be provided against by specific insurances, or by loans upon *respondentia* or bottomry. But as to the rate of legal interest, it has varied and decreased for 200 years past, according as the quantity of specie in the kingdom has increased by accessions of trade, the introduction of paper-credit, and other circumstances. The statute 37 Hen. VIII. c. 9. confined interest to ten per cent. and so did the statute 13 Eliz. c. 8. But as, through the encouragements given in her reign to commerce, the nation grew more wealthy; so, under her successor, the statute 21 Jac. I. c. 17. reduced it to eight per cent.; as did the statute 12 Car. II. c. 13. to six; and lastly, by the statute 12 Ann. stat. 2. c. 16. it was brought down to five per cent. yearly, which is now the extremity of legal interest that can be taken. But yet, if a contract which carries interest be made in a foreign country, our courts will direct the payment of interest according to the law of that country in which the contract was made. Thus Irish, American, Turkish, and Indian interest, have been allowed in our courts to the amount of even 12 per cent. For the moderation or exorbitance of interest depends upon local circumstances; and the refusal to enforce such contracts would put a stop to all foreign trade. And, by stat. 14 Geo. III. c. 79. all mortgages and other securities upon estates or other property in Ireland or the plantations, bearing interest not exceeding six per cent. shall be legal; though executed in the kingdom of Great Britain: unless the money lent shall be known at the time to exceed the value of the thing in pledge; in which case also, to prevent usurious contracts at home under colour of such foreign securities, the borrower shall forfeit treble the sum so borrowed.

For the method of computing interest, see ARITHMETIC, sect. iv. p. 640, and ALGEBRA, sect. xx. p. 658.

INTERJECTION, in *Grammar*, an indeclinable part of speech, signifying some passion or emotion of the mind. See *GRAMMAR*.

INTERIM, a name given to a formulary, or kind of confession of the articles of faith, obtruded upon the Protestants after Luther's death by the emperor Charles V. when he had defeated their forces; so called because it was only to take place in the *interim* (mean time) till a general council should have decided all points in dispute between the Protestants and Romanists. It retained most of the doctrines and ceremonies of the Romanists, excepting that of marriage, which

was allowed to the clergy, and communion to the laity under both kinds. Most of the Protestants rejected it. There were two other interims; one of Leipsic, the other of Franconia.

Interlocutor
||
Interment.

INTERLOCUTOR, in *Scots Law*, is the decision or judgment of a court before the final decree is passed and extracted.

INTERLOCUTORY DECREE, in *English Law*. In a suit in equity, if any matter of fact be strongly controverted, the fact is usually directed to be tried at the bar of the court of king's bench, or at the assizes, upon a feigned issue. If a question of mere law arises in the course of a cause, it is the practice of the court of chancery to refer it to the opinion of the judges of the court of king's bench, upon a case stated for that purpose. In such cases, interlocutory decrees or orders are made.

INTERLOCUTORY Judgments are such as are given in the middle of a cause, upon some plea, proceeding on default, which is only intermediate, and does not finally determine or complete the suit. But the interlocutory judgments most usually spoken of, are those incomplete judgments, whereby the right of the plaintiff is established, but the *quantum* of damages sustained by him is not ascertained, which is the province of a jury. In such a case a writ of inquiry issues to the sheriff, who summons a jury, inquires of the damages, and returns to the court the inquisition so taken, whereupon the plaintiff's attorney taxes costs, and signs final judgment.

INTERLOCUTORY Order, that which decides not the cause, but only settles some intervening matter relating to the cause. As where an order is made in chancery, for the plaintiff to have an injunction, to quit possession till the hearing of the cause; this order, not being final, is called *interlocutory*.

INTERLOPERS, are properly those who, without due authority, hinder the trade of a company or corporation lawfully established, by dealing in the same way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dress, or to give time for changing the scenes and decorations.

In the ancient tragedy, the chorus sung the interludes, to show the intervals between the acts.

Interludes, among us, usually consist of songs, dances, feats of activity, concerts of music, &c.

Aristotle and Horace give it for a rule, that the interludes should consist of songs built on the principal parts of the drama: but since the chorus has been laid down, dancers, buffoons, &c. ordinarily furnish the interludes.

INTERMENT, the act of interring, i. e. burying or laying a deceased person in the ground.

Aristotle asserted, that it was more just to assist the dead than the living. Plato, in his Republic, does not forget, amongst other parts of justice, that which concerns the dead. Cicero establishes three kinds of justice; the first respects the gods, the second the manes or dead, and the third men. These principles seem to be drawn from nature; and they appear at least to be necessary for the support of society, since

Interment at all times civilized nations have taken care to bury their dead, and to pay their last respects to them. See *LURIAL*.

We find in history several traces of the respect which the Indians, the Egyptians, and the Syrians entertained for the dead. The Syrians embalmed their bodies with myrrh, aloes, honey, salt, wax, bitumen, and resinous gums; they dried them also with the smoke of the fir and the pine tree. The Egyptians preserved theirs with the resin of the cedar, with aromatic spices, and with salt. These people often kept such mummies, or at least their effigies, in their houses; and at grand entertainments they were introduced, that by reciting the great actions of their ancestors they might be better excited to virtue. See *FUNERAL Rites*.

The Greeks, at first, had probably not the same veneration for the dead as the Egyptians. Empedocles, therefore, in the eighty-fourth Olympiad, restored to life Ponthia, a woman of Agrigentum, who was about to be interred †. But this people, in proportion as they grew civilized, becoming more enlightened, perceived the necessity of establishing laws for the protection of the dead.

† *Diogenes Laertius de Vita et Moribus Philosophorum*, lib. viii.

At Athens the law required that no person should be interred before the third day; and in the greater part of the cities of Greece a funeral did not take place till the sixth or seventh. When a man appeared to have breathed his last, his body was generally washed by his nearest relations, with warm water mixed with wine. They afterwards anointed it with oil; and covered it with a dress commonly made of fine linen, according to the custom of the Egyptians. This dress was white at Messina, Athens, and in the greater part of the cities of Greece, where the dead body was crowned with flowers. At Sparta it was of a purple colour, and the body was surrounded with olive leaves. The body was afterwards laid upon a couch in the entry of the house, where it remained till the time of the funeral. At the magnificent obsequies with which Alexander honoured Hephæstion, the body was not buried until the tenth day.

The Romans, in the infancy of their empire, paid as little attention to their dead as the Greeks had done. Acilius Aviola having fallen into a lethargic fit, was supposed to be dead; he was therefore carried to the funeral pile; the fire was lighted up; and though he cried out he was still alive, he perished for want of speedy assistance. The prætor Lamia met with the same fate. Tubero, who had been prætor, was saved from the funeral pile. Asclepiades a physician, who lived in the time of Pompey the Great, about one hundred and twenty years before the Christian era, returning from his country-house, observed near the walls of Rome a grand convoy and a crowd of people, who were in mourning assisting at a funeral, and showing every exterior sign of the deepest grief. Having asked what was the occasion of this concourse, no one made any reply. He therefore approached the pretended dead body; and imagining that he perceived signs of life in it, he ordered the bystanders to take away the flambeaux, to extinguish the fire, and to pull down the funeral pile. A kind of murmur on this arose throughout the whole company. Some said that they ought to believe the physician, while others turned both him and his profession into ridicule. The rela-

tions, however, yielded at length to the remonstrances of Asclepiades; they consented to defer the obsequies for a little; and the consequence was, the restoration of the pretended dead person to life. It appears that these examples, and several others of the like nature, induced the Romans to delay funerals longer, and to enact laws to prevent precipitate interments.

At Rome, after allowing a sufficient time for mourning, the nearest relation generally closed the eyes of the deceased; and the body was bathed with warm water, either to render it fitter for being anointed with oil, or to reanimate the principle of life, which might remain suspended without manifesting itself. Proofs were afterwards made, to discover whether the person was really dead, which were often repeated during the time that the body remained exposed; for there were persons appointed to visit the dead, and to prove their situation. On the second day, after the body had been washed a second time, it was anointed with oil and balm. Luxury increased to such a pitch in the choice of foreign perfumes for this purpose, that under the consulship of Licinius Crassus and Julius Cæsar, the senate forbade any perfumes to be used except such as were the production of Italy. On the third day the body was clothed according to its dignity and condition. The robe called the prætexta was put upon magistrates, and a purple robe upon consuls; for conquerors, who had merited triumphal honours, this robe was of gold tissue. For other Romans it was white, and black for the lower classes of the people. These dresses were often prepared at a distance, by the mothers and wives of persons still in life. On the fourth day the body was placed on a couch, and exposed in the vestibule of the house, with the visage turned towards the entrance, and the feet near the door; in this situation it remained till the end of the week. Near the couch were lighted wax-tapers, a small box in which perfumes were burnt, and a vessel full of water for purification, with which those who approached the body besprinkled themselves. An old man, belonging to those who furnished every thing necessary for funerals, sat near the deceased, with some domestics clothed in black. On the eighth day the funeral rites were performed; but to prevent the body from corrupting before that time, salt, wax, the resinous gum of the cedar, myrrh, honey, balm, gypsum, lime, asphaltos or bitumen of Judea, and several other substances, were employed. The body was carried to the pile with the face uncovered, unless wounds or the nature of the disease had rendered it loathsome and disgusting. In such a case a mask was used, made of a kind of plaster; which has given rise to the expression of *funera larvata*, used in some of the ancient authors. This was the last method of concealment which Nero made use of, after having caused Germanicus to be poisoned: for the effect of the poison had become very sensible by livid spots and the blackness of the body; but a shower of rain happening to fall, it washed the plaster entirely away, and thus the horrid crime of fratricide was discovered.

The Turks have, at all times, been accustomed to wash the bodies of their dead before interment; and as their ablutions are complete, and no part of the body escapes the attention of those who assist at such melancholy ceremonies, they can easily perceive whether

ment. one be really dead or alive, by examining, among other methods of proof, whether the *sphincter ani* has lost its power of contraction. If this muscle remains still contracted, they warm the body, and endeavour to recal it to life; otherwise, after having washed it with water and soap, they wipe it with linen cloths, wash it again with rose-water and aromatic substances, cover it with a rich dress, put upon its head a cap ornamented with flowers, and extend it upon a carpet placed in the vestibule or hall at the entrance of the house.

In the primitive church the dead were washed and then anointed; the body was wrapped up in linen, or clothed in a dress of more or less value according to circumstances, and it was not interred until after being exposed and kept some days in the house. The custom of clothing the dead is preserved in France only for princes and ecclesiastics.

In other countries, more or less care is taken to prevent sudden interments. At Geneva, there are people appointed to inspect all dead bodies. Their duty consists in examining whether the person be really dead, and whether one died naturally or by violence. In the north, as well as at Genoa, it is usual not to bury the dead till three days have expired. In Holland, people carry their precautions much farther, and delay the funerals longer. And in England bodies generally remain unburied three or four days.

Premature INTERMENT. Notwithstanding the customs above recited; still, in many places, and on many occasions in all places, too much precipitation attends this last office; or if not precipitation, a neglect of due precautions in regard to the body. In general, indeed, the most improper treatment that can be imagined is adopted, and many a person made to descend into the grave before he has sighed his last breath. The histories related by Hildanus, by Camerarius, by Horstius, by Macrobius in his *Somnium Scipionis*, by Plato in his Republic, by Valerius Maximus, and by a great many modern authors, leave us no doubt respecting the dangers or misconduct of such precipitation. It must appear astonishing that the attention of mankind has been after all so little roused by an idea the most terrible that can be conceived on this side of eternity. If nature recoils from the idea of death, with what horror must she start at the thought of death anticipated, precipitated by inattention—a return of life in darkness, distraction, and despair—then death repeated under agonies unspeakable! To revive nailed up in a coffin! The brain can scarce sustain the reflection in our coolest safest moments.

According to present usage, as soon as the semblance of death appears, the chamber of the sick is deserted by friends, relatives, and physicians; and the apparently dead, though frequently living, body, is committed to the management of an ignorant and unfeeling nurse, whose care extends no farther than laying the limbs straight, and securing her accustomed perquisites. The bed-clothes are immediately removed, and the body is exposed to the air. This, when cold, must extinguish any spark of life that may remain, and which, by a different treatment, might have been kindled into flame; or it may only continue to repress it, and the unhappy person afterwards revive amidst the horrors of the tomb.

The difference between the end of a weak life and the commencement of death, is so small, and the uncertainty of the signs of the latter is so well established both by ancient and modern authors who have turned their attention to that important object, that we can scarcely suppose undertakers capable of distinguishing an apparent from a real death. Animals which sleep during winter show no signs of life; in this case, circulation is only suspended: but were it annihilated, the vital spirit does not so easily lose its action as the other fluids of the body; and the principle of life, which long survives the appearance of death, may re-animate a body in which the action of all the organs seems to be at an end. But how difficult is it to determine whether this principle may not be revived? It has been found impossible to recal to life some animals suffocated by mephitic vapours, though they appeared less affected than others who have revived. Coldness, heaviness of the body, a leaden livid colour, with a yellowness in the visage, are all very uncertain signs: Mr Zimmerman observed them all upon the body of a criminal, who fainted through the dread of that punishment which he had merited. He was shaken, dragged about, and turned in the same manner as dead bodies are, without the least signs of resistance; and yet at the end of 24 hours he was recalled to life by means of volatile alkali.

A director of the coach-office at Dijon, named *Colinet*, was supposed to be dead, and the news of this event was spread through the whole city. One of his friends, who was desirous of seeing him at the moment when he was about to be buried, having looked at him for a considerable time, thought he perceived some remains of sensibility in the muscles of the face. He therefore made an attempt to bring him to life by spirituous liquors, in which he succeeded; and this director enjoyed afterwards for a long time that life which he owed to his friend. This remarkable circumstance was much like those of Empedocles and Asclepiades. These instances would perhaps be more frequent, were men of skill and abilities called in cases of sudden death, in which people of ordinary knowledge are often deceived by false appearances.

A man may fall into a syncope, and may remain in that condition three or even eight days. People in this situation have been known to come to life when deposited among the dead. A body belonging to the hospital at Cassel appeared to have breathed his last: he was carried into the hall where the dead were exposed, and was wrapped up in a piece of canvas. Some time after, recovering from his lethargy, he recollected the place in which he had been deposited, and crawling towards the door knocked against it with his foot. This noise was luckily heard by the sentinel, who soon perceiving the motion of the canvas called for assistance. The youth was immediately conveyed to a warm bed, and soon perfectly recovered. Had his body been confined by close bandages or ligatures, he would not have been able, in all probability, to make himself be heard: his unavailing efforts would have made him again fall into a syncope, and he would have been thus buried alive.

We must not be astonished that the servants of an hospital should take a syncope for a real death, since even the most enlightened people have fallen into errors of

Interment. of the same kind. Dr John Schmid relates, that a young girl, seven years of age, after being afflicted for some weeks with a violent cough, was all of a sudden freed from this troublesome malady, and appeared to be in perfect health. But some days after, while playing with her companions, this child fell down in an instant as if struck by lightning. A death-like paleness was diffused over her face and arms; she had no apparent pulse, her temples were sunk, and she showed no signs of sensation when shaken or pinched. A physician, who was called, and who believed her to be dead, in compliance with the repeated and pressing request of her parents, attempted, though without any hopes, to recal her to life; and at length, after several vain efforts, he made the soles of her feet be smartly rubbed with a brush dipped in strong pickle. At the end of three quarters of an hour she was observed to sigh: she was then made to swallow some spirituous liquor; and she was soon after restored to life, much to the joy of her disconsolate parents.—A certain man having undertaken a journey, in order to see his brother, on his arrival at his house found him dead. This news affected him so much, that it brought on a most dreadful syncope, and he himself was supposed to be in the like situation. After the usual means had been employed to recal him to life, it was agreed that his body should be dissected, to discover the cause of so sudden a death; but the supposed dead person overhearing this proposal, opened his eyes, started up, and immediately betook himself to his heels.—Cardinal Espinola, prime minister to Philip II. was not so fortunate; for we read in the Memoirs of Amclot de la Houffai, that he put his hand to the knife with which he was opened in order to be embalmed. In short, almost every one knows that Vesalius, the father of anatomy, having been sent for to open a woman subject to hysterics, who was supposed to be dead, he perceived, on making the first incision, by her motion and cries, that she was still alive; that this circumstance rendered him so odious, that he was obliged to fly; and that he was so much affected by it, that he died soon after.—On this occasion, we cannot forbear to add an event more recent, but no less melancholy. The abbé Prevost, so well known by his writings and the singularities of his life, was seized with a fit of the apoplexy, in the forest of Chantilly, on the 23d of October 1763. His body was carried to the nearest village, and the officers of justice were proceeding to open it, when a cry which he sent forth affrightened all the assistants, and convinced the surgeon that the abbé was not dead; but it was too late to save him, as he had already received the mortal wound.

*Lond.
Chron.
vol. iv.
p. 456.*

Even in old age, when life seems to have been gradually drawing to a close, the appearances of death are often fallacious. A lady in Cornwall, more than 80 years of age, who had been a considerable time declining, took to her bed, and in a few days seemingly expired in the morning. As she had often desired not to be buried till she had been two days dead, her request was to have been regularly complied with by her relations. All that saw her looked upon her as dead, and the report was current through the whole place; nay, a gentleman of the town actually wrote to his friend in the island of Scilly that she was deceased. But one of those who were paying the last kind office of huma-

nity to her remains, perceived some warmth about the middle of the back; and acquainting her friends with it, they applied a mirror to her mouth; but, after repeated trials, could not observe it in the least stained; her under jaw was likewise fallen, as the common phrase is; and, in short, she had every appearance of a dead person. All this time she had not been stripped or dressed; but the windows were opened, as is usual in the chambers of the deceased. In the evening the heat seemed to increase, and at length she was perceived to breathe.

In short, not only the ordinary signs are very uncertain, but we may say the same of the stiffness of the limbs, which may be convulsive; of the dilation of the pupil of the eye, which may proceed from the same cause; of putrefaction, which may equally attack some parts of a living body; and of several others. Haller, convinced of the uncertainty of all these signs, proposes a new one, which he considers as infallible. "If the person (says he) be still in life, the mouth will immediately shut of itself, because the contraction of the muscles of the jaw will awaken their irritability." The jaw, however, may be deprived of its irritability though a man may not be dead. Life is preserved a long time in the passage of the intestines. The sign pointed out by Dr Fothergill appears to deserve more attention: "If the air blown into the mouth (says this physician) passes freely through all the alimentary channel, it affords a strong presumption that the irritability of the internal sphincters is destroyed, and consequently that life is at an end." These signs, which deserve to be confirmed by new experiments, are doubtless not known to undertakers.

The difficulty of distinguishing a person apparently dead from one who is really so, has, in all countries where bodies have been interred too precipitately, rendered it necessary for the law to assist humanity. Of several regulations made on this subject, we shall quote only a few of the most recent; such as those of Arras in 1772; of Mantua in 1774; of the grand duke of Tuscany in 1775; of the senechaussée of Sivrai, in Poitou, in 1777; and of the parliament of Metz in the same year. To give an idea of the rest, it will be sufficient to relate only that of Tuscany. By this edict, the grand duke forbids the precipitate interment of persons who die suddenly. He orders the magistrates of health to be informed, that physicians and surgeons may examine the body; that they may use every endeavour to recal it to life, if possible, or to discover the cause of its death; and that they shall make a report of their procedure to a certain tribunal. On this occasion, the magistrate of health orders the dead not to be covered until the moment they are about to be buried, except so far as decency requires; observing always that the body be not closely confined, and that nothing may compress the jugular veins and the carotid arteries. He forbids people to be interred according to the ancient method; and requires that the arms and the hands should be left extended, and that they should not be folded or placed cross-wise upon the breast. He forbids, above all, to press the jaws one against the other; or to fill the mouth and nostrils with cotton, or other stuffing. Lastly, he recommends not to cover the visage with any kind of cloth until the body is deposited in its coffin.

We shall conclude this article by subjoining, from Dr Hawes's *Address to the Public* on this subject, a few of the cases in which this fallacious appearance of death is most likely to happen, together with the respective modes of treatment which he recommends.

In apoplectic and fainting fits, and in those arising from any violent agitation of mind, and also when opium or spirituous liquors have been taken in too great a quantity, there is reason to believe that the appearance of death has been frequently mistaken for the reality. In these cases, the means recommended by the *Humane Society for the Recovery of Drowned Persons* should be persevered in for several hours; and bleeding, which in similar circumstances has sometimes proved pernicious, should be used with great caution. (See the article DROWNING). In the two latter instances it will be highly expedient, with a view of counteracting the soporific effects of opium and spirits, to convey into the stomach, by a proper tube, a solution of tartar emetic, and by various other means to excite vomiting.

From the number of children carried off by convulsions, and the certainty arising from undoubted facts, that some who have in appearance died from that cause have been recovered; there is the greatest reason for concluding, that many, in consequence of this disease, have been prematurely numbered among the dead; and that the fond parent, by neglecting the means of recalling life, has often been the guiltless executioner of her own offspring. To prevent the commission of such dreadful mistakes, no child, whose life has been apparently extinguished by convulsions, should be consigned to the grave till the means of recovery above recommended in apoplexies, &c. have been tried; and, if possible, under the direction of some skilful practitioner of medicine, who may vary them as circumstances shall require.

When fevers arise in weak habits, or when the cure of them has been principally attempted by means of depletion, the consequent debility is often very great, and the patient sometimes sinks into a state which bears so close an affinity to that of death, that there is reason to suspect it has too often deceived the bystanders, and induced them to send for the undertaker when they should have had recourse to the succours of medicine. In such cases, volatiles, *eau de luce* for example, should be applied to the nose, rubbed on the temples, and sprinkled often about the bed; hot flannels, moistened with a strong solution of camphorated spirit, may likewise be applied over the breast, and renewed every quarter of an hour; and as soon as the patient is able to swallow, a teaspoonful of the strongest cordial should be given every five minutes.

The same methods may also be used with propriety in the smallpox when the pustules sink, and death apparently ensues; and likewise in any other acute diseases, when the vital functions are suspended from a similar cause.

INTERMITTENT, or **INTERMITTING**, *Fever*; such fevers as go off and soon return again, in opposition to those which are continual. See **MEDICINE Index**.

INTERPOLATION, among critics, denotes a spurious passage inserted into the writings of some ancient author.

INTERPOLATION, in the modern algebra, is used for finding an intermediate term of a series, its place in the series being given. This method was first invented by Mr Briggs, and applied by him to the calculation of logarithms, &c. See **ALGEBRA**.

INTERPOSITION, the situation of a body between two others, so as to hide them, or prevent their action.

The eclipse of the sun is occasioned by an interposition of the moon between the sun and us; and that of the moon by the interposition of the earth between the sun and moon. See **ECLIPSE**.

INTERPRETER, a person who explains the thoughts, words, or writings, of some other, which before were unintelligible.—The word *interpretes*, according to Isidore, is composed of the preposition *inter*, and *partes*, as signifying a person in the middle betwixt two parties, to make them mutually understand each others thoughts: others derive it from *inter*, and *pres*, i. e. *sidejussor*; q. d. a person who serves as security between two others who do not understand one another.

There have been great debates about interpreting Scripture. The Romanists contend, that it belongs absolutely to the church: adding, that where she is silent, reason may be consulted; but where she speaks, reason is to be disregarded. The Protestants generally allow reason the sovereign judge, or interpreter; though some among them have a strong regard to synods, and others to the authority of the primitive fathers. Lastly, others have recourse to the Spirit within every person to interpret for them; which is what Bochart calls *αποδείξις το πνευματος*.

INTERREGNUM, the time during which the throne is vacant in elective kingdoms; for in such as are hereditary, like ours, there is no such thing as an interregnum.

INTERREX, the magistrate who governs during an interregnum.

This magistrate was established in old Rome, and was almost as ancient as the city itself: after the death of Romulus there was an interregnum of a year, during which the senators were each interrex in their turn, five days a-piece.

After the establishment of consuls and a commonwealth, though there were no kings, yet the name and function of *interrex* was still preserved: for, when the magistrates were absent, or there was any irregularity in their election, or they had abdicated, so that the comitia could not be held; provided they were unwilling to create a dictator, they made an interrex, whose office and authority was to last five days; after which they made another. To the interrex was delegated all the regal and consular authority, and he performed all their functions. He assembled the senate, held comitia or courts, and took care that the election of magistrates was according to rules. Indeed at first it was not the custom of the interrex to hold comitia, at least we have no instance of it in the Roman history. The patricians alone had the right of electing an interrex; but this office fell with the republic, when the emperors made themselves masters of every thing.

INTERROGATION, **EROTESIS**, a figure of rhetoric, in which the passion of the speaker introduces a thing

Interro-
to
Interval.

thing by way of question, to make its truth more conspicuous.

The interrogation is a kind of apostrophe which the speaker makes to himself; and it must be owned, that this figure is suited to express most passions and emotions of the mind; it serves also to press and bear down an adversary, and generally adds an uncommon briskness, action, force, and variety, to discourse.

INTERROGATION, in *Grammar*, is a point which serves to distinguish such parts of a discourse, where the author speaks as if he were asking questions. Its form is this (?).

INTERROGATORIES, in *Law*, are particular questions demanded of witnesses brought in to be examined in a cause, especially in the court of chancery. And these interrogatories must be exhibited by the parties in suit on each side; which are either direct for the party that produces them, or counter, on behalf of the adverse party; and generally both plaintiff and defendant may exhibit direct, and counter or cross interrogatories. They are to be pertinent, and only to the points necessary; and either drawn or perused by counsel, and to be signed by them.

INTERSCENDENT, in *Algebra*, is applied to quantities, when the exponents of their powers are radical quantities. Thus, $x\sqrt{a}$, $x\sqrt[3]{a}$, &c. are interscendent quantities.

INTERSECTION, in *Mathematics*, the cutting of one line, or plane, by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual intersection of two planes is a right line. The centre of a circle is in the intersection of two diameters. The central point of a regular or irregular figure of four sides, is the point of intersection of the two diagonals.

The equinoxes happen when the sun is in the intersections of the equator and ecliptic.

INTERSPINALES. See *ANATOMY*, *Table of the Muscles*.

INTERVAL, the distance or space between two extremes, either in time or place. The word comes from the Latin *intervallum*, which, according to Isidore, signifies the space *inter fossam & murum*, "between the ditch and the wall:" others note, that the stakes or piles, driven into the ground in the ancient Roman bulwarks, were called *valla*; and the interices or vacancy between them, *intervalla*.

INTERVAL, in *Music*. The distance between any given sound and another, strictly speaking, is neither measured by any common standard of extension nor duration; but either by immediate sensation, or by computing the difference between the numbers of vibrations produced by two or more sonorous bodies, in the act of sounding, during the same given time. As the vibrations are slower and fewer during the same instant, for example, the sound is proportionally lower or graver; on the contrary, as during the same period the vibrations increase in number and velocity, the sounds are proportionably higher or more acute. An interval in music, therefore, is properly the difference between the number of vibrations produced by one sonorous body of a certain magnitude and texture, and of those produced by another of a different magnitude and texture in the same time.

Intervals are divided into consonant and dissonant.

A consonant interval is that whose extremes, or whose highest and lowest sounds, when simultaneously heard, coalesce in the ear, and produce an agreeable sensation called by Lord Kames a *tertium quid*. A dissonant interval, on the contrary, is that whose extremes, simultaneously heard, far from coalescing in the ear, and producing one agreeable sensation, are each of them plainly distinguished from the other, produce a grating effect upon the sense, and repel each other with an irreconcilable hostility. In proportion as the vibrations of different sonorous bodies, or of the same sonorous body in different modes, more or less frequently coincide during the same given time, the chords are more or less consonant. When these vibrations never coincide at all in the same given time, the discord is consummate, and consequently the interval absolutely dissonant. But, for a full account of these, see *MUSIC*.

INTESTATE, in *Law*, a person that dies without making a will.

INTESTINA, in the *Linnean System*, one of the orders of worms. See *HELMINTHOLOGY Index*.

INTESTINES, INTESTINA, in *Anatomy*, the guts or bowels; those hollow, membranous, cylindrical parts, extended from the right orifice of the stomach to the anus; by which the chyle is conveyed to the lacteals, and the excrements are voided. See *ANATOMY*, N^o 93.

INTONATION, in *Music*, the action of sounding the notes in the scale with the voice, or any other given order of musical tones. Intonation may be either true or false, either too high or too low, either too sharp or too flat; and then this word *intonation*, attended with an epithet, must be understood concerning the manner of performing the notes.

In executing an air, to form the sounds, and preserve the intervals as they are marked with justness and accuracy, is no inconsiderable difficulty, and scarcely practicable, but by the assistance of one common idea, to which, as to their ultimate test, these sounds and intervals must be referred: these common ideas are those of the key, and the mode in which the performer is engaged; and from the word *tone*, which is sometimes used in a sense almost identical with that of the key, the word *intonation* may perhaps be derived. It may also be deduced from the word *diatonic*, as in that scale it is most frequently conversant; a scale which appears most convenient and most natural to the voice. We feel more difficulty in our intonation of such intervals as are greater or lesser than those of the diatonic order; because, in the first case, the glottis and vocal organs are modified by gradations too large; or too complex, in the second.

INTRENCHMENT, in the military art, any work that fortifies a post against an enemy who attacks. It is generally taken for a ditch or trench with a parapet. Intrenchments are sometimes made of fascines with earth thrown over them, of gabions, hogheads, or bags filled with earth, to cover the men from the enemy's fire.

INTRIGUE, an assemblage of events or circumstances, occurring in an affair, and perplexing the persons concerned in it. In this sense, it is used to signify the nodus or plot of a play or romance; or that point wherein the principal characters are most embarrassed through

Intestate
|
Intrigue.

Intrigue
||
Intuitive
evidence.

through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

In tragedy, comedy, or an epic poem, there are always two designs. The first and principal is that of the hero of the piece: the second contains the designs of all those who oppose him. These opposite causes produce opposite effects, to wit, the efforts of the hero for the execution of his design, and the efforts of those who thwart it. As those causes and designs are the beginning of the action, so these efforts are the middle, and there form a knot or difficulty which we call the *intrigue*, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of those opposite efforts: the solution or catastrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The intrigue of the *Iliad* is twofold. The first comprehends three days fighting in Achilles's absence, and consists on the one side in the resistance of Agamemnon and the Greeks, and on the other in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a second. Achilles resolves to be revenged, but Hector opposes his design; and this forms the second intrigue, which is the last day's battle.

In the *Æneid* there are also two intrigues. The first is taken up in the voyage and landing of Æneas in Italy; the second is his establishment there: the opposition he met with from Juno in both these undertakings forms the intrigue.

As to the choice of the intrigue, and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem. Bossu gives us three manners of forming the intrigue of a poem: the first is that already mentioned; the second is taken from the fable and design of the poet; in the third the intrigue is so laid, as that the solution follows from it of course.

INTRINSIC, a term applied to the real and genuine values and properties, &c. of any thing, in opposition to their *extrinsic* or *apparent* values.

INTRODUCTION, in general, signifies any thing which tends to make another in some measure known before we have leisure to examine it thoroughly; and hence it is used on a great variety of occasions. Thus we speak of the introduction of one person to another; the introduction to a book, &c.—It is also used to signify the actual motion of any body out of one place into another, when that motion has been occasioned by some other body.

INTRODUCTION, in *Oratory*. See **ORATORY**, N° 26.

INTUITION, among logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other; in which case the mind perceives the truth as the eye does the light, only by being directed towards it. See **LOGIC**, N° 25, 27.

INTUITIVE EVIDENCE, is that which results from **INTUITION**. Dr Campbell distinguishes different sorts of *intuitive* evidence; one resulting purely from intellect, or that faculty which others have called intuition; another kind arising from consciousness; and a third sort from that new-named faculty *Common Sense*,

which this ingenious writer, as well as several others, contends to be a distinct original source of knowledge; whilst others refer its supposed office to the *intuitive* power of the understanding.

Invalid
||
Inventory.

INVALID, a person wounded, maimed, or disabled for action by age.

At Chelsea and Greenwich are magnificent **HOSPITALS**, or rather colleges, built for the reception and accommodation of *invalids*, or soldiers and seamen worn out in the service.

We have also twenty independent companies of *invalids*, dispersed in the several forts and garrisons.

At Paris is a college of the same kind, called *Les Invalides*, which is accounted one of the finest buildings in that city.

INVECTED, in *Heraldry*, denotes a thing fluted or furrowed. See **HERALDRY**.

INVECTIVE, in *Rhetoric*, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reprov'd; whereas the *invective* is the work of an enemy, and entirely designed to vex and give uneasiness to the person against whom it is directed.

INVENTION, denotes the act of finding any thing new, or even the thing thus found. Thus we say, *the invention of gunpowder, of printing, &c.* The *alcove* is a modern invention owing to the Moors.

The Doric, Ionic, and Corinthian orders, are of a Greek invention; the Tuscan and Composite of Latin invention. Janfon ab Almeloveen has written an *Onomasticon* of inventions; wherein are shewn, in an alphabetical order, the names of the inventors, and the time, place, &c. where they are made. Pancirollus has a treatise of old inventions that are lost, and new ones that have been made; Polydore Virgil has also published eight books of the inventors of things, *De Inventoribus Rerum*.

INVENTION is also used for the finding of a thing hidden. The Romish church celebrates a feast on the 4th of May, under the title of *Invention of the Holy Cross*.

INVENTION is also used for subtilty of mind, or somewhat peculiar to a man's genius, which leads him to a discovery of things new; in which sense we say, *a man of invention*.

INVENTION, in *Painting*, is the choice which the painter makes of the objects that are to enter the composition of his piece. See **PAINTING**.

INVENTION, in *Poetry*, is applied to whatever the poet adds to the history of the subject he has chosen; as well as to the new turn he gives it. See **POETRY**.

INVENTION, in *Rhetoric*, signifies the finding out and choosing of certain arguments which the orator is to use for the proving or illustrating his point, moving the passions or conciliating the minds of his hearers. Invention, according to Cicero, is the principal part of oratory: he wrote four books *De Inventione*, whereof we have but two remaining. See **ORATORY**.

INVENTORY, in *Law*, a catalogue or schedule orderly made, of all the deceased person's goods and chattels at the time of his death, with their value appraised by indifferent persons, which every executor or administrator is obliged to exhibit to the ordinary at such time as he shall appoint.

By 21 Hen. VIII. c. v. executors and administrators

verary
||
Inver-
keithin g.

are to deliver in upon oath to the ordinary, indented inventories, one part of which is to remain with the ordinary, and the other part with the executor or administrator; this is required for the benefit of the creditors and legatees, that the executor or administrator may not conceal any part of the personal estate from them. The statute ordains, that the inventory shall be exhibited within three months after the person's decease; yet it may be done afterwards; for the ordinary may dispense with the time, and even with its being ever exhibited, as in cases where the creditors are paid, and the will is executed.

INVERARY, the county town of Argyleshire, in Scotland, pleasantly situated on a small bay formed by the junction of the river Ary with Loch-fine, where the latter is a mile in width and 60 fathoms in depth. Here is a castle, the principal seat of the dukes of Argyle, chief of the Campbells. It is a modern building of a quadrangular form, with a round tower at each corner; and in the middle rises a square one glazed on every side to give light to the staircase and galleries, which has from without rather a heavy appearance. This castle is built of a coarse *lapis ollaris* brought from the other side of Loch-fine; and is of the same kind with that found in Norway, of which the king of Denmark's palace is built. The founder of the castle, the late Duke Archibald, also formed the design of an entire new town, upon a commodious elegant plan, becoming the dignity of the capital of Argyleshire, a country most admirably situated for fisheries and navigation. The town hath been rebuilt agreeable to the original design; and the inhabitants are well lodged in houses of stone, lime, and slate. They are fully employed in arts and manufactures, and plentifully supplied in the produce of sea and land.—The planting around Inverary is extensive beyond conception, and admirably variegated; every crevice, glen, and mountain, displaying taste and good sense.

The value of the immense wood at this place, for the various purposes of bark, charcoal, forges, paling, furniture, house and ship building, is thus estimated by Mr Knox: "Some of the beech are from 9 to 12 feet in circumference, and the pines from 6 to 9; but these being comparatively few, we shall state the medium girth of 2,000,000 trees planted within these last hundred years, at 3 feet, and the medium value at 4s. which produces 400,000l.; and this, for the most part, upon grounds unfit for the plough, being chiefly composed of hills and rock." One of these hills rises immediately from the house a great height, in the form of a pyramid, and is clothed to the summit with a thick wood of vigorous ornamental trees. On this summit or point Archibald duke of Argyle built a Gothic tower, or observatory, where he sometimes amused himself. The ascent by the road seems to be half a mile, and the perpendicular height about 800 feet.

INVERBERVIE, or BERVIE, a town of Scotland, in Kincardineshire or the Mearns, and a royal borough, 13 miles north-east from Montrose. It lies between two small hills, which terminate in high cliffs towards the sea; it is but a small place, the inhabitants of which are chiefly employed in making thread.

INVERKEITHING, a town of Scotland, in the county of Fife, situated on the northern shore of the

frith of Forth, in W. Long. 3. 15. N. Lat. 56. 5. Inverloch
Invernet It was much favoured by William, who granted its first charter. He extended its liberties considerably, and in the time of David I. it became a royal residence. The Moubrays had large possessions here, which were forfeited in the reign of Robert II. The Franciscans had a convent in this town; and, according to Sir Robert Sibbald, the Dominicans had another. This town has a considerable trade in coal and other articles.

INVERLOCHY, an ancient castle in the neighbourhood of *Fort-William* in Invernesshire. It is adorned with large round towers; and, by the mode of building, seems to have been the work of the English in the time of Edward I. who laid large fines on the Scotch barons for the purpose of erecting new castles. The largest of these towers is called *Cumin's*. But long prior to these ruins, Inverloch, according to Boece, had been a place of great note, a most opulent city, remarkable for the vast resort of French and Spaniards, probably on account of trade. It was also a seat of the kings of Scotland, for here Achaius in the year 790 signed (as is reported) the league offensive and defensive between himself and Charlemagne. In after-times it was utterly destroyed by the Danes, and never again restored.

In the neighbourhood of this place were fought two fierce battles, one between Donald Balloch brother to Alexander lord of the isles, who with a great power invaded Lochaber in the year 1427: he was met by the earls of Mar and Caithness; the last was slain, and their forces totally defeated. Balloch returned to the isles with vast booty. Here also the Campbells under the marquis of Argyle, were in February 1645, defeated by Montrose. Fifteen hundred fell in the action and in the pursuit, with the loss only of three to the royalists.

INVERNESS, capital of a county of the same name in Scotland, is a parliament-town, finely seated on the river Ness, over which there is a stone bridge of seven arches, in W. Long. 4. N. Lat. 57. 36. It is large, well built, and very populous, being the most northerly town of any note in Britain. As there are always regular troops in its neighbourhood, there is a great air of politeness, a plentiful market, and more money and business stirring than could have been expected in such a remote part of the island. The country in the neighbourhood is remarkably well cultivated; and its produce clearly shows that the soil and climate are not despicable. The salmon-fishery in the Ness is very considerable, and is let to London fishmongers. Some branches both of the woollen, linen, and hemp manufacture, are also carried on here; and, in consequence of the excellent military roads, there is a great proportion of inland trade. But besides all this, Inverness is a port with 20 creeks dependent upon it, part on the Murray frith to the east, and part on the north of the town, reaching even the south border of the county of Caithness. Inverness has several good schools; and an academy was erected some years ago on an extensive and liberal plan. The inhabitants speak the Erse and English language promiscuously. On an eminence near the town are the remains of a castle, where, according to some historians, the famous Macbeth murdered Duncan his royal guest.

Inverness-shire.

INVERNESS-Shire, a county of Scotland, bounded on the north by Ross-shire; on the east by the shires of Nairne, Murray, and Aberdeen; on the south, by those of Perth and Argyle; and on the west, by the Atlantic ocean. Its extent from north to south is above 50 miles; from east to west about 80.—The northern part of this county is very mountainous and barren. In the district of Glencelg are seen the ruins of several ancient circular buildings, similar to those in the Western Isles, Sutherland, and Ross-shires; concerning the uses of which antiquarians are not agreed. In their outward appearance, they are round and tapering like glass-houses. In the heart of the wall, which is perpendicular within, there are horizontal galleries going quite round and connected by stairs. These ascend toward the top, which is open. They are all built of stone, without lime or mortar of any kind. They have no opening outward, except the door and the top; but there are several in the inside, as windows to the galleries. From Bernera barracks, in this district, proceeds the military road to Inverness.

This county is nearly divided by water, so that by means of the Caledonian canal uniting Loch Ness, Loch Oich, Loch Lochy, and Lochiel or Loch Eil, a communication will be opened between the eastern and western seas. This great undertaking is now (1807) going forward. In this tract, Fort George, Fort Augustus, and Fort William, form what is called the *Chain of Forts* across the island. By means of Fort George on the east, all entrance up the frith towards Inverness is prevented; Fort Augustus curbs the inhabitants midway; and Fort William is a check to any attempts in the west. Detachments are made from all these garrisons to Inverness, Bernera barracks opposite to the isle of Skye, and Castle Duart in the isle of Mull.

The river Ness, upon which the capital of the shire is situated, is the outlet of the great lake called *Loch Ness*. This beautiful lake is 22 miles in length, and for the most part one in breadth. It is screened on the north-west by the lofty mountains of Urquhart and Meal-fourvonv, and bordered with coppices of birch and oak. The adjacent hills are adorned with many extensive forests of pine; which afford shelter to the cattle, and are the retreat of stags and deer. There is much cultivation and improvements on the banks of Loch Ness; and the pasture-grounds in the neighbouring valleys are excellent.—From the south, the river Fyers descends towards this lake. Over this river there is built a stupendous bridge, on two opposite rocks; the top of the arch is above 100 feet from the level of the water. A little below the bridge is the celebrated Fall of Fyers, where a great body of water darts through a narrow gap between two rocks, then falls over a vast precipice into the bottom of the chasm, where the foam rises and fills the air like a great cloud of smoke.

Loch Oich is a narrow lake, stretching about four miles from east to west. It is adorned with some small wooded islands, and is surrounded with ancient trees. Near this is the family seat of Glengary, surrounded by natural woods of full grown fir, which extend nine or ten miles along the banks of the river Cary. The

waters of Loch Oich flow through Loch Ness into the eastern sea.—Loch Lochy transmits its waters in an opposite direction, this being the highest part of the vast flat tract that here stretches from sea to sea. This extensive lake is above ten miles in length, and from one to two in breadth. From the west, the waters of Loch Arkek descend into this lake. Out of it runs the river Lochy, which about a mile below its issue from the lake receives the Spean, a considerable river, over which there is a magnificent bridge, built by General Wade, about two miles above the place where it falls into the Lochy. These united streams traversing the plains of Lochaber, after a course of five or six miles, fall into Loch Eil.

A few miles to the south-east of Loch Lochy is Glenroy or King's Vale. The north-east end of this valley opens on Loch Spey. A small river passes along the bottom of the vale, accompanied by a modern road. On the declivity of the mountains, about a mile from the river, on either hand, are seen several parallel roads of great antiquity. On the north-west side, five of these roads run parallel and close by each other. On the opposite side are three other roads exactly similar. These roads are 30 feet broad, all perfectly horizontal, and extend eight or nine miles in length. Their destination or use has baffled the conjectures of antiquaries.—Not far from Fort Augustus soars the pointed summit of Bennevis, which is esteemed the highest mountain in Britain, rising more than 4300 feet above the level of the sea.—In the districts of Moydart, Arafack, Morer, and Knoydart, there are numerous bays and creeks, along the coast, many of which might be excellent fishing stations.

The southern part of this county is very mountainous, and is supposed to be the most elevated ground in Scotland. From its numerous lakes many streams descend toward both seas. In the extensive district called *Badenoch* lies Loch Spey, the source of the great river Spey, which proceeding eastward with an increasing stream, enters the shire of Murray at Rothiemurchus, after having expanded into a fine lake. Not far from this is seen the lofty top of Cairngorm; a mountain celebrated for its beautiful rock-crystals of various tints. These are much esteemed by lapidaries; and some of them, having the lustre of fine gems, bring a very high price. Limestone, iron-ore, and some traces of different minerals, are found in the county; but no mines have yet been worked with much success. Its rivers and lakes afford abundance of salmon and trout. The extensive plains which surround the lakes are in general fertile; and the high grounds feed many sheep and black cattle, the rearing and selling of which forms the chief trade of the inhabitants.—By the present spirited exertions of the gentlemen in this populous county, the commerce and the industry of the inhabitants have of late been greatly increased; and to facilitate the communication with other parts, application has been made to parliament for leave to levy a tax on the proprietors of land for improving the roads and erecting bridges in this extensive shire. The commonalty in the high parts of the county and on the western shore speak Gaelic; but the people of fashion in Inverness and its vicinity use the English language, and pronounce it with remarkable propriety.

Inverness-shire.

The following is a view of the population of the different parishes in the county at two different periods.*

INVERSE, is applied to a manner of working the rule of three. See ARITHMETIC, n° 13.

INVERSION, the act whereby any thing is inverted or turned backwards. Problems in geometry and arithmetic are often proved by inversion; that is, by a contrary rule or operation.

INVERSION, in Grammar, is where the words of a phrase are ranged in a manner not so natural as they might be. For an instance: "Of all vices, the most abominable, and that which least becomes a man, is impurity." Here is an inversion; the natural order being this: Impurity is the most abominable of all vices, and that which least becomes a man.—An inversion is not always disagreeable, but sometimes has a good effect.

INVERTED, in Music, is derived from the Latin preposition *in*, and *vertere*, "to turn any thing a contrary way."

It signifies a change in the order of the notes which form a chord, or in the parts which compose harmony: which happens by substituting in the bass, those sounds which ought to have been in the upper part: an operation not only rendered practicable, but greatly facilitated by the resemblance which one note has to another in different octaves; whence we derive the power of exchanging one octave for another with so much propriety and success, or by substituting in the extremes those which ought to have occupied the middle station; and *vice versa*. See MUSIC.

INVESTIGATION, properly denotes the searching or finding out any thing by the tracts or prints of the feet; whence mathematicians, schoolmen, and grammarians, come to use the term in their respective researches.

INVESTING a PLACE, is when a general, having an intention to besiege it, detaches a body of horse to possess all the avenues; blocking up the garrison, and preventing relief from getting into the place, till the army and artillery are got up to form the siege.

INVESTITURE, in Law, a giving livery of seisin or possession. There was anciently a great variety of ceremonies used upon investitures; as at first they were made by a certain form of words, and afterwards by such things as had the greatest resemblance to the thing to be transferred: thus, where lands were intended to pass, a turf, &c. was delivered by the granter to the grantee. In the church, it was customary for princes to make investiture of ecclesiastical benefices, by delivering to the person they had chosen a pastoral staff and a ring.

INVISIBLE LADY, an amusing experiment in Acoustics, which was exhibited in this country, first by a Frenchman, and afterwards by others; in which, from the construction of the apparatus, a lady who conversed, sung and played on musical instruments, seemed to be enclosed in a hollow metallic globe, of about a foot in diameter. See SCIENCE, Amusements of.

INULA, ELECCAMPANE; a genus of plants belonging to the Syngenesia class; and in the natural method ranking under the 49th order, *Compositæ*. See BOTANY Index.

INUNDATÆ, the name of the 15th order in Linnæus's fragments of a natural method; consisting of plants which grow in the water. See BOTANY, p. 309.

INUNDATION, a sudden overflowing of the dry land by the waters of the ocean, rivers, lakes, springs, or rains.

INVOCATION, in Theology, the act of adoring God, and especially of addressing him in prayer for his assistance and protection. See the articles ADORATION and PRAYER.

The difference between the invocation of God and of the saints, as practised by the Papists, is thus explained in the catechism of the council of Trent. "We beg of God (says the catechism), to give us good things, and to deliver us from evil; but we pray to the saints, to intercede with God and obtain those things which we stand in need of. Hence we use different forms in praying to God and to the saints: to the former we say,

hear

Invocation ^{ab.} *hear us, have mercy on us*; to the latter we only say, *pray for us.*" The council of Trent expressly teaches, that the saints who reign with Jesus Christ offer up their prayers to God for men; and condemn those who maintain the contrary doctrine. The Protestants reject and censure this practice as contrary to Scripture, deny the truth of the fact, and think it highly unreasonable to suppose that a limited finite being should be in a manner omnipresent, and at one and the same time hear and attend to the prayers that are offered to him in England, China, and Peru; and from thence infer, that if the saints cannot hear their requests, it is inconsistent with common sense to address any kind of prayer to them.

INVOCATION, in *Poetry*, an address at the beginning of a poem, wherein the poet calls for the assistance of some divinity, particularly of his muse, or the deity of poetry.

INVOICE, an account in writing of the particulars of merchandise, with their value, customs, charges, &c. transmitted by one merchant to another in a distant country.

INVOLUCRUM, among botanists, expresses that sort of cup which surrounds a number of flowers together, every one of which has beside this general cup its own particular perianthium. The involucre consists of a multitude of little leaves disposed in a radiated manner. See CALYX.

INVOLUTION, in *Algebra*, the raising any quantity from its root to any height or power assigned.—See ALGEBRA.

IO, in fabulous history, daughter of Inachus, or according to others of Jasus or Pirene, was priestess of Juno at Argos. Jupiter became enamoured of her; but Juno, jealous of his intrigues, discovered the object of his affection, and surprised him in the company of Io. Jupiter changed his mistress into a beautiful heifer; and the goddess, who well knew the fraud, obtained from her husband the animal whose beauty she had condescended to commend. Juno commanded the hundred-eyed Argus to watch the heifer; but Jupiter, anxious for the situation of Io, sent Mercury to destroy Argus, and to restore her to liberty. Io, freed from the vigilance of Argus, was now persecuted by Juno, who sent one of the Furies to torment her. She wandered over the greatest part of the earth, and crossed over the sea, till at last she stopped on the banks of the Nile, still exposed to the unceasing torments of the Fury. Here she entreated Jupiter to restore her to her natural form; and when the god had changed her from a heifer into a woman, she brought forth Epaphus. Afterwards she married Telegonus king of Egypt, or Osiris according to others; and she treated her subjects with such mildness and humanity, that after death she received divine honours, and was worshipped under the name of Isis. According to Herodotus, Io was carried away by Phœnician merchants, who wished to make reprisals for Europa who had been stolen from them by the Greeks.

JOAB, general of the army of King David, defeated the Syrians and the other enemies of David, and took the fort of Zion from the Jebusites, who, thinking it impregnable, committed it to the care of the lame and blind, whom they placed on the walls. He signalized himself in all David's wars, but was guilty of

basely murdering Abner and Amasa. He procured a reconciliation between Absalom and David; and afterwards slew Absalom, contrary to the express orders of the king. He at length joined Adonijah's party; and was put to death by the order of Solomon, 1014 B. C.

JOACHIMITES, in *Church-History*, the disciples of Joachim a Cistercian monk, who was an abbot of Flora in Calabria, and a great pretender to inspiration.

The Joachimites were particularly fond of certain ternaries: The Father, they said, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260; and from that time the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and the manner of living, into three classes, according to the three persons in the Trinity: The first ternary was that of men; of whom the first class was that of married men, which had lasted during the whole period of the Father; the second was clerks, which had lasted during the time of the Son; and the last was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit: The second ternary was that of doctrine, viz. the Old Testament, the New, and the everlasting Gospel; the first they ascribed to the Father, the second to the Son, and the third to the Holy Spirit: A third ternary consisted in the manner of living, viz. under the Father, men lived according to the flesh; under the Son, they lived according to the flesh and the spirit; and under the Holy Ghost, they were to live according to the spirit only.

JOAN, POPE, called by Platina *John VIII.* is said to have held the holy see between Leo IV. who died in 855, and Benedict III. who died in 858. Marianus Scotus says, she sat two years five months and four days. Numberless have been the controversies, fables, and conjectures, relating to this pope. It is said that a German girl, pretending to be a man, went to Athens, where she made great progress in the sciences; and afterward came to Rome in the same habit. As she had a quick genius, and spoke with a good grace in the public disputations and lectures, her great learning was admired, and every one loved her extremely; so that after the death of Leo, she was chosen pope, and performed all offices as such. Whilst she was in possession of this high dignity, she was got with child; and as she was going in a solemn procession to the Lateran church, she was delivered of that child, between the Coliseum and St Clement's church, in a most public street, before a crowd of people, and died on the spot, in 857. By way of embellishing this story, may be added the precaution reported to have been afterward taken to avoid such another accident. After the election of a pope, he was placed on a chair with an open seat, called the *groping chair*, when a deacon came most devoutly behind and satisfied himself of the pontiff's sex by feeling. This precaution, however, has been long deemed unnecessary, because the cardinals, it is alleged, take care to become fathers before they arrive at the pontificate.

JOAN d'Arc, or the Maid of Orleans, whose heroic behaviour in reanimating the expiring valour of the French nation, though by the most superstitious means, (pretending

Joachimites
Joan d'Arc.

Joanna
||
Joel.

(pretending to be inspired), deserved a better fate. She was burnt by the English as a forceress in 1421, aged 24. See FRANCE, N^o 101.

JOANNA, St, or HINZUAN, one of the Comora islands in the Indian ocean. E. Long. 44. 15. S. Lat. 12. 30. See HINZUAN.

JOB, or *Book of Job*, a canonical book of the Old Testament, containing a narrative of a series of misfortunes which happened to a man whose name was *Job*, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the subject of his misfortunes, and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend that this relation is altogether a fiction; others think it a simple narrative of a matter of fact just as it happened: while a third sort of critics acknowledge, that the groundwork of the story is true, but that it is written in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining.

The time is not set down in which Job lived. Some have thought that he was much ancients than Moses, because the law is never cited by Job or his friends, and because it is related that Job himself offered sacrifices. Some imagine that this book was written by himself; others say, that Job wrote it originally in Syriac or Arabic, and that Moses translated it into Hebrew: but the rabbins generally pronounce Moses to be the author of it; and many Christian writers are of the same opinion.

JÖBBER, a person who undertakes jobs, or small pieces of work.

In some statutes, jobber is used for a person who buys and sells for others. See BROKER.

JÖBBING, the business of a jobber.

Stock-JÖBBING, denotes the practice of trafficking in the public funds, or of buying and selling stock with a view to its rise or fall. The term is commonly applied to the illegal practice of buying and selling stock for time, or of accounting for the differences in the rise or fall of any particular stock for a stipulated time, whether the buyer or seller be possessed of any such real stock or not. See *Stock-BROKER*.

JOCASTA, in fabulous history, a daughter of Mæneceus, who married Laius king of Thebes, by whom she had Œdipus. She afterwards married her son Œdipus, without knowing who he was, and had by him Eteocles, Polynices, &c. When she discovered that she had married her own son and been guilty of incest, she hanged herself in despair. She is called *Epicastra* by some mythologists.

JOCKEY, in the management of horses; the person who trims up, and rides about horses for sale.

JOEL, or *the Prophecy of Joel*, a canonical book of the Old Testament. Joel was the son of Pethuel, and the second of the twelve lesser prophets. The style of this prophet is figurative, strong, and expressive. He upbraids the Israelites for their idolatry, and foretels the calamities they should suffer as the punishment of that sin: but he endeavours to support them with the comfort that their miseries should have an end upon their

reformation and repentance. Some writers, inferring the order of time in which the minor prophets lived from the order in which they are placed in the Hebrew copies, conclude that Joel prophesied before Amos, who was contemporary with Uzziah, king of Judah. Archbishop Usher makes this inference from Joel's foretelling that drought, chap. iv. 7, 8, 9. If we consider the main design of Joel's prophecy, we shall be apt to conclude, that it was uttered after the captivity of the ten tribes; for he directs his discourse only to Judah, and speaks distinctly of the sacrifices and oblations that were daily made in the temple.

JOGHIS, a sect of heathen religious in the East Indies, who never marry, nor hold any thing in private property; but live on alms, and practise strange severities on themselves.

They are subject to a general, who sends them from one country to another to preach. They are, properly, a kind of penitent pilgrims; and are supposed to be a branch of the ancient Gymnosophists.
